May I suggest that we all secure places on the builders' committee of this great Canadian Construction Club, Cow Testing; that we help the doubting Thomas's to kick away their crutches of indecision and join the big class A-1 of stalwart dairymen in their forward movement; for this fact must surely be in the lavendar jar of your remembrance, the successful dairymen everywhere are those who practice modern cow testing.

C. F. WHITLEY.

QUALITY SHORTHORNS

Editor Maritime Farmer:

Having noticed in the last isue of your paper that new regulations are being made regarding exhibiting Shorthorn cows, the suggested change being that cows must have a calf at foot, it occured to me that you might be interested in hearing of what my Dual Purpose cow "Daisy Lodge" has done. She completed her Record of Performance as a four-year-old in October last year, making a total production of 11,638 lbs. of milk, 480 lbs. butterfat in 365 days. Accompanying the Certificate from the Live Stock Commissioner was a letter stating that this cow lead the four-year-old class by a considerable margin.

I now have three Dual Purpose Shorthorns qualified in R. O. P. (each of these animals have made considerably over and above the amount necessary to qualify), and another heifer has been milking for a litte over three months, also entered in R. O. P.

If you are interested in this class of cattle I would like you to come down and have a look at them.—P. R. L. Fairweather.

LIVE STOCK.

THE CARE OF PREGNANT ANIMALS

Periods of pregnancy are unquestionably the most important time in the life of a breeding animal, and the very best attention should be given during such times, for the proper care of the mother animal and the unborn young has a decided effect on the offspring after birth.

During this time the animals are naturally slow and lazy, and it is very important that plenty of exercise be afforded. This should be gentle, regular and of a sufficient amount, but never of a rough or overtaxing nature, as it is very easy to seriously injure a pregnant animal. A considerable amount of a moderate form of exercise is absolutely necessary to enable the animal to properly assimilate sufficient food for its bodily needs and for the development of the unborn young, as well as to enable it to carry on other natural bodily functions such as throwing off waste matter. If these conditions are not brought about the animal's health is seriously impaired by the accumulation of imprities in the body, and as a result the offspring is small, weak, puny, and an easy prey to disease. Lack of care during this time is the most prolific source of loss among livestock in the young being born dead, or so vitally weak that they never develop into animals worth the time, trouble and expense of raising.

On many farms there are mares with foal at this season of the year, and so far the need of better care and feeding has not been so great, but from now on the amount of nourishment the fetus needs will constantly increase, for the most rapid growth is made during the last few months of pregnancy. This is the time to give the best attention to the brood animal's feed. At this time a pregnant mare is literally two animals and must receive food accordingly. Overwork or lack of nourishment during this period is equivalent to starving the calt ofter it is born. Exercise is very essential and if used judiciously pregnant mares can be worked with much benefit to themselves and foal, as well as profit to their owners; but if they are made to do any heavy work the colt naturally suffers from the strain. Entire cessation from work is likely to cause digestive troubles, but remember that a mare heavy with foal should not be forced to do heavy pulling or work of a jerky nature. So long as the work is not overtaxing a mare may be worked moderately to within a month of feeding, without harmful results.

Comfortable Quarters Essential

As the mare increases in size the harness should be adjusted to prevent binding or chafing. Stalls should be large and roomy, preferably of the box type, for in a small or narrow stall a mare may have difficulty in rising, and for this reason she will stand much more than is good for her. All gates and other openings through which pregnant mares or cows pass should be sufficiently wide to prevent pressure, as many cases of serious injury and abortion result from animals passing through narow gates and doorways. It is best not to take any risk at such critical times.

In the matter of feeding there is often a disposition to save on the grain feed, especially if the mare is not working and supply the deficiency with ha yand straw. However, this is an extremely poor policy, as there is so little nutriment and so much indigestible material in such feeds that the animal will have rough, dead looking hair, dull eyes and a general rundown appearance. The fullness of the abdominal cavity at this time makes it necessary to give concentrated feeds instead of so much bulky ones, and because o fthis the mare should be humored. Feeding should be done regularly, three times a day, even when not at work, instead of twice a day ,as is usually the rule with other idle horses. Good bright hay, with oats and bran fed in proper proportion, make an excellent ration. Protein is very essential during the latter part of the gestation period. Oats is very nutritious and bran has a tendency to prevent constipation. The feeder should use his best judgment in feeding.

Exercise for Brood Sows

Brood sows are especially lazy and indisposed to move around during pregnancy but if necessary they should be forced from their beds, particularly in cold weather, and driven about in order that they may get the muchneed exercise. This promotes healthy bodily functions and this is so essential, some means of compelling them to take sufficient exercise the last few wekes before farrowing should be devised. Plenty of exercise is as necessary for the brood sow as a well-balanced ration. A good plan to force this is to have the sleeping quarters in one end of a long, narrow lot and the feed trough in the opposite end, or by having the feed and water in small amounts in various places over the pen.

Hogs suffer more from the extremes of hot, cold or rainy weather than any other class of farm animals, and for this reason brood sows should be provided with good shelter. However, this does not necessarily mean elaborate or expensive equipment. A good shelter is warm, free from dampness, well ventilated and so constructed as to admit plenty of sunshine.

Brood sows should not be housed in dark, filthy quarters or allowed to run around stables and manure piles. And they must not be crowded into close quarters where they are apt to pile up and cause loss of several pigs, if not an entire litter. At present prices for pork and live animals pigs are worth saving.

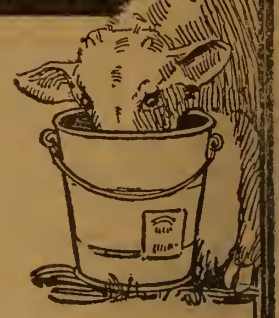
Proper care of the sow during pregnancy pays the highest dividends, and as the value of a brood sow is determined by the number of pigs she raises to weaning time, she should have proper management both before and after farrowing. Immediately before farrowing a sow should be given the same kind of feed she will receive after farowing, which prevents any digestive disturbances due to a sudden change of diet.

A few days before the computed date put the sow in the pen where she is to stay during the time and reduce her feed, and if the ration is properly balanced and of a sufficiently laxative nature she will come to farrowing time in fine condition. In this connection it is well to remember that for several weeks the young pigs are being fed through the mother and any irregularities in her diet or system may seriously affect her young. Too much attention cannot be given to these facts.

Extra Feed Pays

Cows are often subject to rather poor treatment for, through ignorance or a desire for gain, many people reduce the feed of their cows from one-half to two-thirds during the dry period. This is quite a serious mistake, however, for it should be remembered that, at this time, food is needed for a double purpose, just the same as when giving milk. It never pays to stint the feed of any pregnant animals in an effort to economize during a time when they are not actually producing visible results. This is particularly true of milk cows if one expects to get a reasonable flow of milk after calving. A cow that has had her feed reduced for several months before calving will have drawn on her reserve force to keep the feeding of the unborn calf up to normal, consequently she comes to the milking period in a badly run down condition, very often having a milk flow that is not sufficient even for the calf. In such cases the cow proves unprofitable as a milk

The Feed for Hungry Calves



Conserve the milk and help the nation. You do not need to feed milk to your calves if you use Royal Purple Calf Meal. It is a perfect substitute for milk. It is partially cooked, and the pure ingredients are so combined that the meal will not injure or derange the digestive organs of even the youngest calf. If you want rapid development and healthy calves, feed

Royal Purple Calf Meal

Let the following unsolicited testimonial letters convince you of the sterling qualities of our calf meal.

John D. Hamilton, Port Hope, Ont., writes:
"I have used Royal Purple Calf Meal and find it perfectly satisfactory, and I am recommending to my friends. I might add that I find no trouble with the calves scouring while using this meal. I have tried many other Calf meals, but never found one that proved satisfactory until I got Royal Purple."

S. M. Osborne, Maxwell, Ont., writes:
"We have a pretty good calf which is now four months old and weighs 400 lbs. I think your calf meal is fine. I have never fed anything that will make a calf grow as fast as this meal."

Order Royal Purple from your feedman. It is sold in 25, 50 and 100-lb. bags.

A WARNING!
To "Victory Bond" Owners

DO not under any consideration part with your Victory Bonds at less than their market value. They are one of the premier securities of the world. The security behind them consists of every square inch of territory, every railway, factory, every farm and building—everything in Canada from coast to coast.

Certain private individuals may try to persuade you to part with your Victory Bonds at less than their true market value. Instances of this nature have recently come to light. These individuals are unscrupulous. They have only their own selfish ends in view.

Victory Bonds have a known value.

If through force of circumstances or for other reasons you have to sell, remember there are many people who realize the investment value of Victory Bonds at their present market price, and are desirous of adding to their holdings.

It is one of the functions of the members of the Montreal Stock Exchange to provide a central market where all who wish to buy or sell Victory Bonds or other securities, may come and be assured of dealing at the current market price.

If you want to add to your holdings of Victory Bonds, or desire to invest money in other securities, any member of the Montreal Stock Exchange will be pleased to give you complete and reliable information.

Write today to the Secretary of the Montreal Stock Exchange. It places you under no obligation. Use the form below provided for the purpose.

MONTREAL STOCK EXCHANGE

To the Secretary of the Montreal Stock Exchange
Room 532, Montreal Stock Exchange Building, Montreal.
Without obligation, please send me your Book on Investing, also information regarding the market value for Victory Bonds.

producer due simply to poor management, but the owner, thinking she has passed her useful stage, disposes of her at once. It is hardly necessary to state that the cow should be given a fair chance.

All pregnant animals should be given a diet that is nourishing, not too bulky and easily digesetd. Fat has a decided tendency to make an animal whether idle or working, sluggish and inactive, something that must be avoided during prenancy. The condition of the bowels should be closely watched as they are easily deranged at this time, and any disturbance is dangerous and may prove fatal. It is very essential to the health of both the mother and the young that all organs of the body properly perform their functions, and when out of order they should be corrected at once. If some of these precautions were taken there would be less loss in livestock.

Kindness in caring for all stock is a factor that results in profit, and animals that are always gently handled come to regard the one who cares for them as a friend, and his presence does not excite or frighten them. This is very valuable when the young things are being born and asistance is necessary. If animals have learned from past care to regard the attendant with fear the mother instinct will prompt them to resent any attention from him. When animals trust their attendant his presence may save many of the young things that would otherwise perish. Sheep are very easily excited and gentleness is especially valuable in handling them. Sudden fright causes sheep to rush together, very often causing serious injury. Pregnant animals of all kinds should be kept apart from other stock to prevent injury from kicking, crowding or being stepped on.

THE FEEDING OF CALVES

(Experimental Farms Note.)

Give a calf an extra good start the first six months of its life and doing so cheaply, is the secret of successful and economical stock raising.

No matter how good the calf at birth, it will be handled at a loss, or more or less serious handicapped for future usefulness and profit if not fed carefully and cheaply in its early days.

The present high prices of milk practically exclude this product being used to any extent in calf rearing, although it is absolutely necessary for the first three or four weeks if the best results are to be obtained. To discover the best substitutes for whole milk and the best methods and practices in calf feeding, a large number of experiments have during the past three years been conducted on the Dominion Experimental Farms. The detailed results of this work will be published in th enear future. However, a few deductions from these experiments are given herewith.

I. It is more profitable to breed and rear good young stock to maturity than to purchase the average cows for sale, which are usually the animals least profitable and desirable in the neighbors herd.

II. The cheapest way of building up a good herd is to raise it. The feed costs of good rearing in Canada range from $16.00 to $24.30 for 6 months calves, $24.00 to $45.00 for 12 months calves and $37.00 to $74.30 for 24 months heifers, the variation depending on methods of feeding, feeds available and market values of these feeds.

III. Calves of poor type and breeding are not worth rearing, but good calves properly bred will be worth at least 30% and up to 100% more than their feed cost at two years of age.

IV. Calves of good size, strong constitution and large capacity will, on the same feed, make greater growth and better gains than small, weak, narrow individuals.

V. Good rearing of calves is most profitable as shown in such results as,

Earlier maturity in size.

Earlier maturity in profitable production.

Greater production throughout the whole life time.

More valuable and in greater demand at the highest price.

Healthier stock.

More durable animals.

Better able to consume most profitably all cheap farm grown roughages and convert these into milk.

VI. The calf reared on its dam costs 25 to 50% more than the pail-fed calf, and the more productive the cow the greater will be the charges against the calf.

VII. Pail-fed calves reared to 6 to 8 months largely on whole milk, make gains which cost $14.00 to $18.75 per cwt., which is several times the cost when a properly fed substitute for whole milk is used.

VIII. Skim-milk fed sweet at a temperature of about 90 degrees Fahr. is the best single substitute for whole milk, and may reach a value of 70 cents per cwt. or more in feeding young calves. However, skim-milk may be improved by the addition of a good cream substitute such as flaxseed jelly, oatmeal or a well-balanced calf meal.

IX. Buttermilk, if fed uniformly as to acidity and temperature, may have a slightly greater value than skim-milk. Great caution must, however be taken to start calves at a greater age and very gradually.

X. In feeding calves to 6 to 8 months of age on rations composed largely of skim-milk or buttermilk and a good cream substitute, gains may be made at a cost of feed amounting to from $2.00 to $7.15 per cwt., this amount varying with the character and price of meal and the ruggedness and thrift of the calves.

XI. If well started on mothers milk calves may be well reared on calf meals without whole or skim-milk. However, greater care and attention must be paid to these calves, and even so, gains cost from $5.00 to $15.41 per cwt. or nearly double the cost where some skim-milk is used.

XII. There are many excellent calf meals on the market in Canada. The Canadian manufactured meals are as good as and generally decidedly superior to imported meals, due not only to the palatability o fthe ingredients and the chemical balance, but even more to the freshness and freedom from mustiness.

Of the Canadian made calf meals used the three which in total gains have given excellent satisfaction are Royal Purple, Gold Dollar and Caldwell's.

Providing the necesary ingredients are available, it may often be more econonmical for the feeder to mix his own calf meals. If properly done, the resulting gains in weight of the calves may be nearly as great, and often at a much reduced cost.

XIII. In order to rear the best and cheapest cows, all pail-fed calves should be taught to eat, at an early age, cheap and nutritious farm-grown roughages and grains. The best roughages are grass, fine alfalfa or clover hay, swede turnip, mangles and ensilage. Of the grains, oats and barley are unexcelled.

To Have Better Calves

1. Give suitable feeds and avoid overfeeding.

II. Feed regularly and carefully.

III. Keep calf pens clean and freshly bedded.

IV. Avoid in every possible way all such infectious diseases as scours, tuberculosis, black leg and abortion.

V. Destroy parasites such as lice, worms and ringworms.

AYRSHIRE CATTLE

EVERY FARM SHOULD HAVE AN AYRSHIRE

07% BUTTER FAT was the average from 971 Ayrshire Cows for one year.

Takes the "work" out of farmwork

An Alpha Gas Engine

AN Alpha will saw more wood in a day than you can saw by hand in a week.

It will run a feed cutter, silo filler, or a thresher.

It will pump water all day long without watching.

It will run your cream separator, churn or washing machine.

There will not be a day when you cannot find some way in which your Alpha will save time, money and labor for you.

Owning an Alpha is cheaper than hiring someone else's engine. The money you now have to pay out for engine hire when you need power and the greater amount of work you could do if you had an engine of your own would soon pay the cost of an Alpha.

The Alpha is a simple, powerful engine that will give you more reliable service and cause you less trouble than any other engine you can buy. It's the kind of labor saver you need on your farm.

Ask for catalogue, prices and complete information. Made in twelve sizes, 1½ to 28 H. P. Each furnished in stationary, semi-portable or portable style, and with hopper or tank-cooled cylinder.

THE DE LAVAL COMPANY, Ltd.

LARGEST MANUFACTURERS OF DAIRY SUPPLIES IN CANADA.
Sole manufacturers in Canada of the famous De Laval Cream Separators and Ideal Green Feed Silos. Alpha Gas Engines, Alpha Churns and Butter-Workers. Catalogues of any of our lines mailed upon request.

MONTREAL PETERBORO WINNIPEG VANCOUVER

A MARITIME BREEDERS PERSONAL EXPERIENCE WITH THE BROOD SOW

Editor the Maritime Farmer:

Owing to the war causing such a great shortage in food stuffs and there being so much importance laid on greater pork production, as the pig probably matures much quicker and with cheaper foods than other classes of live stock, therefore increasing the food supply at once, I feel it my duty to tell others of our experience.

You must be kind and gentle with the sow at all times. Step in the pen often when feeding or cleaning out and pet her.

Do not have her fat. Some writers will say not too fat, but from life experience I repeat, do not have her fat; it causes three quarters the trouble at farrowing time. On the other hand do not starve her so that she is in a run down condition at any time. See that she is not shut up in an 8 x 10 ft. pen and that she has plenty of exercise. The manure shed is a grand place for her in the day time; if you have not that, let her out in the barn yard when the other stock is in the stables.

Before and after the sow is bred we feed the following: In morning about ½ bus. of roots or damaged potatoes and dirt from root cellar floor with 2 or 3quarts dry chop or middlings. At noon an ordinary sized pail full of warm slops and refuse from the house. At night 3quarts oats and 3 quarts bran dry. I may here add that our sows with about this feeding are always in good growthy condition.

You should know the date she was bred so as to know very near the day of farrowing. A couple of days before due to farrow slack off the feed and when she starts making her bed, which is from 12 to 24 hours before farrowing, feed her only half her usual feed and that well scalded and sloppy (no dry feed), continue this for about two days after farrowing.

When she starts to make her bed take all wet or damp bedding away and give her short or cut straw, preferably oat chaff, as this lessens the danger of the young pigs getting fast in the bedding and the sow trampling or laying on them. Just give her enough bedding to keep her dry underneath, as when she has a large amount of bed there is great danger of the youing getting jammed.

Have her pen and bed well warmed if farrowing in cold weather. I always like to be on hand when farrowing and if the sow is restless or the weather cold, I take the young from her as they arrive and put them in a box alongside of a stove or in a good warm place. Then as soon as she is through I takethe young and let them feed and if the sow is quiet let them stay with her.

If she is not quiet I take them away from her and let her feed them every two hours until she quiets down and they get strong enough to take care of themselves.—Breeders.

THE HORSE

CHILLS, COLDS, AND CATARRH.

Treatment

Having got the horse dry and bandaged and rugged, have a bran and linseed mash prepared with a few oats and three or four tablespoonfuls of treacle. Offer some chilled water now, and then, after the horse has drunk or refused it, give a fever drench. And here let me observe that not one groom or carter in ten, unless previously instructed, gives a drench correctly. First get a piece of wide, strong webbing about 14 or 15 inches long, and make a loop of it around a spade handle, or inserted in a 5-ft. stout stick at the top through a hole. Get a box to stand upon, put a hempen halter on the horse, very loosely secured with a knot in the nose-band —i.e., room to open upper jaw. Turn the horse round from the manger, place loop over the upper jaw behind the incisor teeth, then place the loose end of the halter and the stick carrying the loop in the hands of an attendant, and then elevate the head. The giver of the drench, standing on the off side, having poured it into a drench tin, or an empty champagne pint bottle wrapped round with a cloth, in case of breakage, gives slowly in small quantities, dropping the head if coughing occurs. Have plenty of patience; it is not easy for the animal to swallow in such an unnatural position. If he holds the drink, tickle the roof of the mouth with the finger. Do not pinch the throat, do not shout, but be gentle. Do not use a stable fork to lift the head. If there is going to be a gymnastic exhibition a fork is a very dangerous instrument for all concerned.

Composition of Fever Drench

This is for a horse of about 15.2 hands; there-fourths suffice for a horse under that height, and one and a quarter for a horse of 17 hands:—Sweet spirit of nitre, 1¼ oz.; tincture of aconite, 40 drops; solution of acetate of amomnia, 2 oz; spirit of camphor, ½ oz.; water to 10 oz. The same to be repeated in four hours time, and afterwards, for a day or two, one might and morning. Should the attack be scotched and not killed, and a cough develop, stop the drenches and give one of the following powders three times daily, made into a paste with honey or treacle, and plastered on tongue and between back teeth with a flat piece of wood or shallow spoon:—Powdered belladonna leaves, ½ oz.; powdered aniseed, ½ oz.; powdered chloride of ammonium, 2 drachms; powdered liquorice root, ½ oz. If the throat is sore, paint between the jowl and along the windpipe the following application:—Methylated belladonna liniment, 2 oz.; methylated soap liniment, 1 oz.; do this three times daily. If there is much discharge from the nostrils, steam the head with a nosebag containing hay over which boiling water has been poured, or a mixture of hay seeds or bran, of course taking care that it is cooled sufficiently for the point of the human elbow, say, to bear it without discomfort. On the contents of the bag sprinkle a mixture of one tablespoonful of turpentine and one tablespoonful of friar's balsam. All this can be renewed and applied night and morning.

Diet

This should consist of a very little hay, and that preferably chaffed and damped, sloppy bran and linseed mashes offered in a pail (not put into a manger, as portions not eaten go sour, and the horse turns away, whereas a pail can be easily cleansed and uneaten portions emptied away). If in season give a little green meat; if in winter a few crushed carrots.

General Remarks.

The horse should be put into a roomy, loose, airy box, away from other horses, if it is a case of contagious catarrh, as otherwise there is a risk of it running through the stables. Groom slightly every day, uncovering only half of the body at a time. Renew the bandages first, hand-rubbing the legs, and reapply the bandages warmed and not too tight. Do not use mustard either on the throat or sides; it is the cause of many a sub-maxillary abscess. It is a valuable remedy, but frightfully abused. If the breathing is difficult and painful, get one tablespoonful of turpentine and two tablespoonfuls of vinegar, and beat it up, the first with an egg; add half a pint of water slowly, and then add the vinegar. Rub this well in both sides of chest, then rug up with a blanket wrung out in hot water and covered with dry rugs. This with a fever drench will put the animal in a sweat and possibly prevent lung trouble. After three or four hours, when the rug is removed, rub in over the skin about a gill of methylated spirit to close the pores and prevent a secondary chill, then dry rug once more. On no account, however pressing the need of his services, should a horse be worked if his temperature is above the normal.

Never give any form of aloes, however small, to a horse showing any signs of a cold or cough, as if there is an epizootic in the neighbourhood of colds, strangles, or influenza, the effect is frequently disastrous. The linseed mashes and bran and treacle will operate in time as a laxative, especially if helped with a clyster of warm soap and water.

In the majority of cases, if no complications arise (and the above treatment is preventive of same), two or three days will put animal right; but for the first few days work gently, take precautions, and give a little tonic medicine for a week or two in the form of a powder of this type night and morning, sprinkled over food:—Powdered sulphate of iron, 1 drachm; sulphate of quinine, 15 grains; powdered loaf sugar, 2 oz. This will make one powder; twelve to be prepared. SOUTHERN VET.

CAUSES OF STERILITY IN MARES

Shy breeders among mares occasionally create some concern. It is claimed, with some evidence to support the contention, that the higher the breed in the scale of purity, the more irregularly does the animal produce its young, and that mares leading a natural life are more certain foal-getters than those fed and housed under artificial conditions. Darwin points out that "any sort of change in the habits of life of an animal, provided it be great enough, tends in some way to affect the power of reproduction." In countries where housing and stall feeding are practised this may, to a certain extent, attain in horse-breeding, but in Australia, owing to constant and abundant sunlight, even temperatures, excellent natural pasturage, and open spaces, we have advantages that induce sexual fertility and lessen the percentage of barren mares. This is not necessarily a constant factor, however, for the droughts by which we occasionally are visited, with their attendant deficiency of succulent feed, bring about a shortage of foals. It is also claimed that irregular breeding in mares runs in certain lines of blood. Marshall states:—

"It is well known that the fertility of animals which are much inbred is often reduced, but it is by no means invariably the case. Thoroughbred horses are often inbred, and it is interesting to note that in one of the earlier reports of the Royal Commission on Horse Breeding in England it is shown that no less than 40 per cent. of the thoroughbred mares in the country fail to have foals each year. This relatively large amount of sterility is probably due to a variety of causes, and not entirely owing to the results of inbreeding."

It is pointed out by Ewart that mares abort most freely from the sixth to ninth week after conception, but it is most difficult to ascertain how many cases of failure to foal are due to this trouble.

Insufficient Diet.

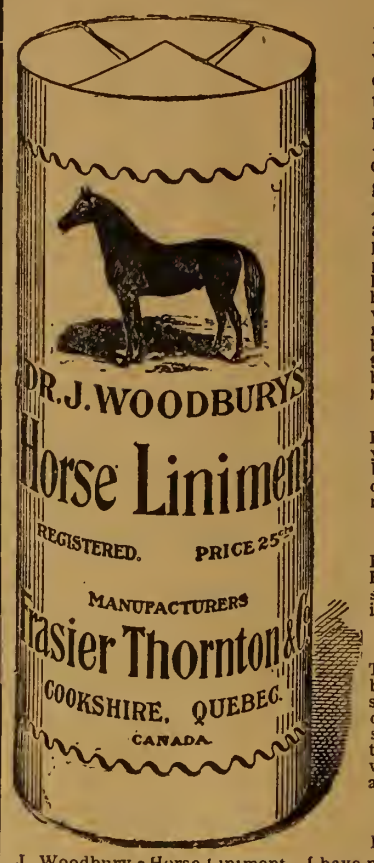
In animals which, as a general rule, breed freely in a state of domestication or under confinement, it is probable that nutrition plays the chief part (though by no means the sole part) in regulating the capacity to produce offspring. That an insufficient or marked abnormal diet must affect sexual power is almost self-evident. An excessive diet, tending towards producing a fatty condition, is likewise prejudicial to the proper discharge of the reproductive functions. As example of the way in which overfeeding results in a condition of sterility, the barren Shire mares which, in recent years, have been a striking feature at agricultural shows in England may be quoted. Definite vgures are not available to show to what extent mares are sterile, especially during droughts, but those made available by the Horse Breeding Commission in England may be quoted to illustrate the position. This Commission controlled the expenditure of £40,000 per annum for the King's Premiums in the breeding of light horses. During the six years 1900 to 1905 inclusive 9.230 mares were mated with the King's Premium stallions, and during that time the highest percentage of foals was fifty-nine, which was reached in 1903 and in 1905. The lowest percentage of foals was in 1900, when is fell as low as 52 per cent.

Defects in the Sires

It has to be remembered, however, that the failure to produce a high percentage may be due to defects in the sires, In round numbers, in the six years under review, there were close upon 5,000 foals by Premium stallions, or a fraction over over 54 per cent. In the year 1905 we find the percentage of the foals ranging from 33 per cent. credited to the sire Sunborne, to 88 per cent. credited to the sire Battlement. Twelve of the twenty-eight Premium stallions left from 65 to 88 per cent. of foals. In the service season of 1911 fifty King's Premium stallions served 3,245 mares, an average of 65 mares per stallion. Of the 3,245 service fees paid eighty were in respect of trials, and out of the 3,165

Dr. J. Woodbury's Horse Liniment

THE INFALLIBLE REMEDY



For the removal of Splints, Bog Spavins, enlargements of any and every description it has no equal. Given internally, it will promptly relieve and remove any and every character of Cough Enlargements of the Glands, Affections of the Kidneys. For distemper, strangles, and colic it is infallibly the remedy All horses that are stabled should have an application of Dr. J. Woodbury's Horse Liniment to tbe hoofs of tbe forefeet to prevent their becoming feverisb, dry, brittle, hard, contracted or otherwise injured Insist on having Dr. J. Woodbury's Horse Liniment. We warrant it to effect that for which it is recommended wben used according to directions. Its beneficial effects are so prompt and decided that it has excited tbe admiration of tbe leading borsemen of the Dominion and secured tbeir bigbest confidence.

Bear River, N. S.
Dear Sirs:—We do not hesitate in recommending your Dr. Woodbury's Horse Liniment. We bave used it in the woods for coughs, colds, distemper and cuts and would say tbat no lumberman sbould be without it.
Yours truly, Clarke Bros.

Hubbard's Cove, N. S.
Dear Sirs:—I bave used Dr J. Woodbury's Horse Liniment in my stable for years and consider it the best liniment on the market for both internal and external use.
Yours truly, C. C. McLean.

Truro, N. S.
This is to certify that I have used Dr. J. Woodbury's Horse Liniment with the very best results for colds, coughs, distemper and all lung deseases. It is the best to give borses in the spring to keep them in condition. It purifies tbe blood, cleanses tbe lungs from impurities wbich may exist and gives tbe system healtby action.

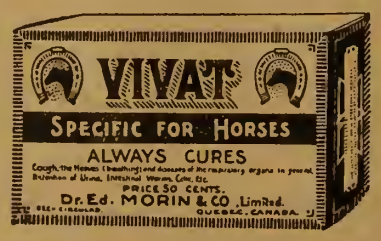
Newton Lee, Owner "All Right" 5817.
Elmsdale, N. S.
Dear Sirs:—Kindly send me 6 dozen bottles Dr. J. Woodbury s Horse Liniment. I have not a bottle in tbe store and it is the only kind my customers will take. Yours truly, Elmsdale Mercantile Co.

Elmsdale, N. S. Dear Sirs:—I cured my horse with Dr. J. Woodbury's Horse Liniment. It was a bad case of distemper. I always recommend this liniment to my friends as tbe best for all diseases of the borse. Yours truly, H. R. Wbitehead.

Dear Sirs:—One of my horses had a bad cough and I made a complete cure witb three bottles of Dr. J. Woodbury's Horse Liniment. The cough was of twelve months standing. In my large experience with horses I consider this liniment to be tbe best made for all diseases in the horse, I recommend it to my friends. E. J. Anderson, Truro, N. S.

FRASIER THORNTON, & CO., Limited, Manufacturers: Cookshire, Quebec, Canada

The Recognized Specific of Diseases of the Horse



A sovereign remedy in powder form which cures, Coughs, Heaves, Colic, etc. It strengthens the work horse as well as the race horse, and enables them to do more and better work. It has been successfully prescribed by many veterinarians notably by Dr. J. D. Duchene, in many critical cases, where results have proved remarkable.

A 50c box will be sufficient for six days' treatment.

DR. ED. MORIN & CO., LIMITED, - - Quebec, Canada

THE BEST LINIMENT

OR PAIN KILLER FOR THE HUMAN BODY

Gombault's Caustic Balsam

IT HAS NO EQUAL

For the Human Body —It is penetrating, soothing and healing, and for all Old Sores, Bruises, or Wounds, Felons, Exterior Cancers, Boils Corns and Bunions, CAUSTIC BALSAM has no equal as a Liniment.

A Perfectly Safe and Reliable Remedy for Sore Throat, Chest Cold, Backache, Neuralgia, Sprains, Strains, Lumbago, Diphtheria, Sore Lungs, Rheumatism and all Stiff Joints

We would say to all who buy it that it does not contain a particle of poisonous substance and therefore no harm can result from its external use. Persistent, thorough use will cure many old or chronic ailments and it can be used on any case that requires an outward application with perfect safety.

REMOVES THE SORENESS—STRENGTHENS MUSCLES

Cornhill, Tex.—"One bottle Caustic Balsam did my rheumatism more good than $120.00 paid in doctor's bills." OTTO A. BEYER.

Price $1.50 per bottle. Sold by druggists, or sent by us express prepaid. Write for Booklet B.

The LAWRENCE-WILLIAMS COMPANY, Toronto, Can.

mares actually covered no information could be obtained of the results of the service of 245. The particulars of foaling for the remaining 2,929 mares show that 1,567 foals were dropped, giving an average percentage of foaling of 53.66. From this series of figures we may summarise the results as "one foal to two mares served." In Australia it is considered a fair average if 60 per cent. of foals are dropped amongst draughts. Some information may be derived from the records kept at the Hawkesbury Agricultural College, showing the services and foal results each year. The mares were mated each year with sires selected from those available in the district, and in seven years the percentage of foals was 58.6.

To the mare is attributed the power of impressing her foal with vigour to the internal organisation, such as the functions of digestion, breeding, endurance, disposition, and constitution. In the case of a draught mare, ability to throw a good foal depends largely upon breeding, management, feeding and soundness.

H. W. Potts, Principal Hawkesbury College, N.S.W.

BIG MONEY IN "ORNERY" HORSES

MY free book will amaze you. See the big money that is being made by those I taught my famous system of horse breaking and training! Wild colts and vicious, unmanageable horses can be picked up for a song. By my methods you can quickly transform them into gentle, willing workers and re-sell them at a big profit. You can also earn fat fees breaking colts and training horses for others.

Write! My book is free, postage prepaid. No obligation. A postcard brings it. *Write today.*

Prof. JESSE BEERY, 702A Main St., Pleasant Hill, Ohio

THICK, SWOLLEN GLANDS that make a horse Wheeze, Roar, have Thick Wind or Choke-down, can be reduced with

ABSORBINE

Also any Bunch or Swelling. No blister, no hair gone, and horse kept at work. Concentrated—only a few drops required at an application. $2 per bottle delivered.

Book 3 K free.

ABSORBINE, JR., antiseptic liniment for man kind, reduces Cysts, Wens, Painful, Knotted Varicose Veins, Ulcers. $1 and $2 a bottle at dealers or delivered. Book "Evidence" free. W. F. YOUNG, P.D.F. 124 Lymans Bldg., Montreal, Can.

Taught in simplest English during spare time. Diploma granted. Cost within reach of all. Satisfaction guaranteed. Have been teaching by correspondence twenty years. Graduates assisted in many ways. Every person interested in stock should take it. Write for catalogue and full particulars - - FREE

London Vet. Correspondence School Dept. 47 London, Ontario, Can.

Various are the tricks the unscrupulous horse trader has in his bag for the discomfiture of the unwary. For example, there is the hiding of spavins, side bones and ringbones. These unsoundnesses may be covered up by bruising or burning the parts, producing a temporary inflammation that may seem quite innocent to the buyer until it disappears a few days later.

Many a man has bought a horse thinking him to be free of all vices later to find him to be a cribber. Cribbing in its natural state is caused by stomach trouble. There are, however, many cases of cribbing caused by imitation. To temporarily stop a horse from cribbing a horse trader will either saw between the teeth, cut the gums or drive wedges between the teeth. This will make the mouth tender and there will be no cribbing while such a condition lasts.

Show-ring men put ginger into the low biwel or they will moisten the anus with some irritant. This will make the horse carry his tail high and act very full of life. Suspicion a horse that carries his tail high and is very full of 'pep'.

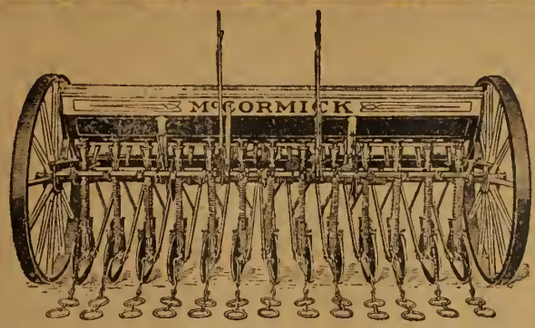
Heavey horses are passed off every day for being sound of wind. A horse with the heaves can breathe easier when the stomach is empty. The feed of a heavey horse is moistened with linseed oil or with arsenic, lobelia, etc. See the animal watered and fed, then run him up a hill or on a heavy road. You will readily detect heaves if present.

A dishonest horseman will sell a sweenied horse and sell him as sound. This he will do by blowing air into the sweeney. This will hide the emaciated part and pass the ordinary eye of inspection. Feel the shoulder over with the hands.

A switcher is more commonly known as a "line grabber." There are many horses that will switch to get the line undtr the tail and then become unmanageable. A crooked horse dealer will paralyze the tail by hanging a weight to the tail or tying the tail over the back for a couple of hours. This will make the tail hang like a rag. Be very slow in buying a horse that has many scars over his body unless you know why the scars are present.

LYMPHANGITIS

C. D. O. has a horse that swells in the hind legs while standing in the stable. He also has a mare that has heaves, and a cow whose cream does not turn into butter as soon as it should do. 1. Mix four ounces each of sulphate of iron and nitrate of potassium and divide into 24 doses. Give one twice a day in bran mash and repeat the above quantity if needed, also hand rub and bandage the legs while the animal is in the stable. Give regular exercise. 2. There is no cure for heaves. 3. Try heating the cream to about 65 degrees before churning.



Buy a McCormick Drill

BECAUSE drill-planted seed gets an earlier, more even start — because drill planting saves seed and produces a better grade of grain — because drill planting saves time and work — and because the **McCormick** drill is one from which you get all these advantages, buy a **McCormick** drill.

The **McCormick** comes in single disk and hoe styles, 11 and 13 marker sizes. All have the famous double-run feed which handles accurately both large grain and small, from peas and beans down to flax, planting any desired quantity per acre, planting it evenly, and covering it to just the right depth. Your crop could not get a better start than the one given to it by a **McCormick** drill.

See the **McCormick** local dealer when you are ready to buy. He will show you all the details of construction that put the **McCormick** drill at the head of its class. Or, if you write the nearest branch house below, we will send you full information.

POULTRY.

SPROUTED OATS—A YEAR-AROUND GREEN FOOD FOR POULTRY.

Green food, so called, has long been recognized as a necessary food for all of our domesticated animals, both beast and bird. Necessity brought to life the principles of the silo, and the dairyman's brains brought it to its present state of efficiency. Where in this great country is the successful dairy farm without its silo, whether large or small? There is none. This question will soon be asked of the foultry farms and their grain sprouters, and the answer will be the same.

The grain sprouter is as much a part of the permanent equipment of a successful poultry farm, as are the birds themselves. Why? Because it produces, with the least cost and labor, the best green food—sprouted oats—in the natural state, every day in the year.

We have proved to our own satisfaction that sprouted oats make the best and cheapest all round poultry feed. They are a natural tonic and regulator and keep birds in perfect physical condition. They increase egg production without injury to the laying hen, strengthen the fertility of the hatching eggs, develop fast growth in young stock and cut the feed bill in half. Therefore, in our opinion, sprouted oats are necessary every day in the year; and it is a very easy and simple matter to secure them. A comparatively few years ago the agricultural colleges commenced advocating the use of several green goods, such as beets, lettuce, cabbage, potatoes, steamed alfalfa and clover, etc. But all this meant land, labor cost of cultivating and lastly a root cellar for winter use, with often frozen or decayed green stuff before spring; and the whole process ate into the egg profit to such an extent that the question was often asked—is it worth all the cost and trouble? Judging from our own experience, it was not. As practical poultrymen we were compelled to turn our attention to the sprouting of grains.

Having heard a few years ago of sprouting oats in boxes, we tried it and found that the oats on top would sometimes sprout an inch or so, while those on the bottom never had a chance and often would become mouldy and decay. At best they never sprouted and were a dead loss. Next we tried both wood and concrete floors with equally poor results. There was nothing sure about the oats sprouting and unquestionably they took too long—from seven to ten days—to grow about three inches. Also the sprouts were coarse and tough, while invariably a certain number of the oats failed to grow at all.

As a further experiment we tried a long wooden table in a heated cellar, but the results were far from satisfactory. It required too much time for the grain to grow, and frequently the developed sprouts grew mouldy and decayed. It often happened that a little too much water drowned them, or because of insufficient moisture they became overheated and ruined. At this rate there were days when the birds had no grain at all, and under the most favorable conditions the labor in turning and mixing the oats was very great, so we gave up in disgust and directed our experiments into other channels.

We bought advertised grain sprouters of all knids, some at exhorbitant prices, and used them according to directions, only to spoil more oats. A few of the machines worked quite well under certain conditions, but we wanted one that would work under all conditions, without a chance of mould and decay—a machine that anyone could handle, requiring a slight amount of work, and one that would grow a crisp, snappy, tender, yellow sprout in the shortest possible time, so we continued our experiments.

The sprouting of oats is divided into three distinct stages: first, soaking; second, germinating; third, sprouting, and the great majority of oats is spoiled in the sprouting, because the operator does not appreciate the difference between the second and third stages.

If germination is carried too far, the oats become mouldy and decay, and from experience I place the dividing point between germination and sprouting when the sprouts average about a quarter of an inch in length. Up to this point, after soaking, the oats should be kept packed in boxes or barrels and well covered with burlap bagging. They need no light now, nor at any time, neither do they require ventilation to speak of during this stage. During the germinating period, however, which lasts from two to four days, one must be cacful how the oats are watered. Keep them damp, using luke warm water twice daily. Too much water will drown them, and too little will allow them to scorch. Either fault means decay. With very little practice one can soon learn by the sense of touch how to water oats during germination. They should feel warm when the hand is passed through them. If two warm, they have not been watered enough, and if not warm enough they have been wet too much. During germination they should be thoroughly mixed morning and night, and the easiest and quickest way is to dump them from one receptacle into another. I would advise watering first and then stirring or mixing. As germinating oats need a certain amount of artificial heat. I would advise keeping these boxes, when in use, in the cellar or kitchen, by the furnace or stove or in other warm location.

After germinating sufficiently the oats are ready for the sprouting trays. Here we have an entirely different process. Whereas, in germinating, oats need confinement, little if any ventilation and a small amount of heat and moisture, in sprouting they need good ventilation, all the heat they can stand, plenty of moisture and no mixing or stirring. Root ventilation is the secret of al plant growth, therefore use wire bottom trays with as large mesh as possible, but small enough to hold the growing grain, and because they need ventilation, they must be spread out not over half an inch thick. If thicker than this some are smothered and fail to grow properly. Do not disturb them while sprouting in any way until ready to use as feed. If the sprouting machine is properly ventilated, no amount of moisture will harm the growing grain, and they must be kept well watered to insure the maximum growth. The temperature should be kept as high as possible, with care to avoid scorching the roots of the youngest most tender sprouts by too much heat.

Another most important point is light. Do not have it. Keep the oats growing in the dark and they will be tender and juicy to the tip. Light means green food and green food means tough food; and the only thing the light does to growing grain is to toughen it.

Our method for sprouting oats is to soak them for twelve hours in luke warm water, a quart and a half of dry seed oats for every hundred birds. Then drain the water off and pack the oats in what we call a germinating box, to the depth of at least four inches, the deeper the better. Every twelve hours we sprinkle slightly with luke warm water and stir by pouring the oats into another box. This is repeated until the sprouts average about one-quarter of an inch in length, when they are spread out on sprouting trays about half an inch in depth, and placed in the sprouter and watered thoroughly at least twice daily. Trays are one inch deep. By using the oats as feed after sprouting four days (when they average six inches and more in height), we have cut the feed bill considerably, increased egg production and kept the birds healthy. I might add that oats are fed every day in the year to all our stock and it pays well. Grown in this way the sprouts will be tender and juicy to the tip, mould is impossible and the oats cannot decay, drown or burn up. It seems hardly necessary to add, that we use only the very best quality of seed oats for sprouting.

HATCH THEM ALL!

A good strong chick from every hatchable egg is what you should demand of your incubator. That's what you are entitled to and that's what you get when you use a Buckeye.

It is built up to a standard — not down to a price. Twenty-five years of development have established the Buckeye as correct in principle and exact in operation. There is no guess work or gambling with valuable eggs and more valuable time. Every machine is sold under this sweeping Guaranty:

The BUCKEYE is guaranteed to hatch more chicks and stronger chicks than any other incubator; to operate satisfactorily in any temperature down to freezing; to require no artificial moisture and no attention to the regulator from the time the hatch is started until it is finished.

Perfect mechanical construction is also guaranteed. Any Buckeye or part thereof that does not fulfill our guaranty will be replaced any time within 40 days.

Used by more than half a million breeders, big and little, it gives universal satisfaction. Our guaranty goes with the first hatch. Beginners with the Buckeye stay in the business because it pays. They grow big by adding more Buckeyes. That is the greatest cause of our tremendous growth of sales.

Stop Your Brooder Losses

Raise all those good chicks. You needn't lose one if you employ the brooder that is scientifically designed and built to do the work. The Standard Colony Brooder has no rival. It stands alone. Makes three chicks grow where one grew before. Cuts installation and operating cost to less than half —labor to less than a fourth. Burns hard or soft coal. Fire lasts twenty-four hours from one filling. Completely self-regulating.

There is nothing to it but a smooth cast iron stove, a galvanized steel hover and the regulating apparatus. Easy to clean and keep sanitary. No wooden walls or curtains to harbor vermin and dirt. No corners where chicks can be crushed.

Write Your Own Guarantee

Write down what you want a brooder to do for you. We'll sign it, and will send your money back without argument if your Standard does not fulfill your guaranty.

Buckeye Incubators and Standard Colony Brooders are endorsed by all Agricultural Colleges and Experiment Stations. Sold by over 6000 dealers. Your dealer will be glad to show them in operation.

Write for Buckeye catalog. It contains the most wonderful testimonials of success in poultry raising you ever read, from Buckeye and Standard users.

126 Euclid Ave. Springfield, Ohio
Pacific Coast Branch: Box 126 Oakland, Cal.

FREDERICTON, N. B., POULTRY SHOW—1918

One of the most succesful Poultry Shows of recent years was pulled off at Frederciton, January 1st to 3rd, by the York and Sunbury Poultry & Pet Stock Asociation.

The show was made up entirely of the Utility varieties. There was an almost entire absence of the strictly fancy.

The New Brunswick Department of Agriculture is offering encouragement only to the useful farm varieties of Utility poultry.

Although the weather was cold and the Show a local one and confined to

the popular varieties, there was a total of 600 birds cooped. The notable and pleasing feature o fthe Show was the improvement of quality in the stock, but the most noticeable and conspicuous improvement was the better fitting and conditioning of the exhibits. There were a few strings of birds laid down in faultless condition, —they were a delight to the Judge's eye and it was a pleasure to handle them.

This Association is fortunate in having a splendid management, the officers are workers and pull well together. Too much credit cannot be given the Secretary, Murray Hagerman. and the Superintendent, Jas, Stickles, in the way they handled and staged the show.

Thc awards were placed by Seth Jones, assisted by A. C. McCullogh, the new Poultry Superintendent for New Brunswick. The awards seemed to give satisfaction, as not one complaint was heard.

Barred Rocks—A large class, but this is the one class of all popular classes that lacked quality. There was only one bird in the class that deserved special mention and that was first pullet, and she was in a class all by herself.

Wyandottes.—White—This was the banner class of the Show in quality, besides it was the largest, both in open class and in pens. 1st. Ideal type, good head, breast, back and tail, but falls a little out in color. 2. Another good one, but not so good in type or as massive. 3. Whitest in class but failed very much in breast shape. Hens. 1. A good one, laid down in perfect fit. She also won special best hen in Show. 2 and 3 were also good ones, well up. Cockerel. 1. Very nice type, good all over, a real Wyandotte. 2 and 3 very close up. This was one of the largest and closest sections in Show. Pullet. 1. A nice one of splendid type, good color. 2. Close runner up. 3, 4 and 5. All in the running, but lost to 1 and 2 in type. Buff. A small but a good quality. Class 1 Cockerel and 1 Pullet very nice. Silvers—a little disappointing for this popular variety in New Brunswick.

Rhode Island Reds—Second largest class in the Show, with plenty of quality—in the S. C. Class. Cockerel. 1. Good color, a warm red with rich under color, free from smut. 2. Too dense in surface color, lacked sheen and finest, but very strong in under color. 3. Fair Hens. The hen class did not compare with cocks in puality. Cockerels. 16 in Class. 1. A reall good one, stood out from his class. 2, 3, 4 and 5 all nice in color and style. Pullets. 1 and 2 very close. 1 wins on even color,—the other winners very good.

Leghorns.—S. C. C. White. Right up in numbers with White Wyandottes and R. I. Reds and with equal puality in three varieties. In these three varieties were the big interest and keen competition. Cock. 1. A crackerjack, without doubt one of the best cocks in Eastern Canada. He went to the best male in the Show for a special. 2 and 3 good type and nice quality. Hens. 1. Good color and shape, her only out was comb. 2. A very neat and stylish rbird. 3. Good but short on legs. Cockerel. A big class. 1. A dandy, only real fault weak in leg color, but in shape, head and color of plumage hard to excel. 2. Good type of body and tail carriage, but failed in comb and did not stand on legs long enough to make him stylish. 3. A nice one, in fact several good ones had to be left out. Pullet. A very nice lot. 1. An easy winner, grand in head, shape and well spread tail. 2 and 3 close up and very white. Brown and Black S. C. Leghorns were a good class. 1 hen 1 pullet in browns good.

Orpington.—Buff. A nice quality. lot of young birds.

Brahmas—Light, a very high class lot especially 1 and 2 cocks, 1 and 2 hens. Langshan were a fairly nice class.

There were fair classes Houdans, Hamburgs, especially Blacks. Campines, anconas, minorcas, Spanish and Dark Cornish.

Turkeys, Geese. Brought out grand specimens and added much to finish out the Show. Some remarkably strong bredeing pens were shown. White Wyandottes, White Rocks, Rhode Island Reds and mating pen of Barred Rocks and other leading varieties were well represented in pens.

Sgd. SETH JONES, Jude.

COST OF KEEPING POULTRY

My attention has been called to statements puporting to have been issued by or under the authority of the United States Government, as to the cost of keeping poultry in these times of high prices, which are detrimental to all concerned, for the reason that they convey the impression that the present prices of eggs and dressed poultry are too high. The statement is to the effect that the cost of caring for a flock of birds at the present time is about in the ratio of 13c for every dozen eggs produced by the Leghorn fowl, and 17c per dozen for eggs laid by thc larger American and Asiatic breeds.

As a matter of fact it costs about double that, by actual test, and that figure would barely cover the cost of grain alone, with no provision whatever for grit, shell, labor investment, or anything, except the grain alone. At present grain cost, the actual expense of keeping a hen in a flock which is housed under model conditions, and cared for exactly as flocks are cared for at the leading experimental stations in the United States, is almost exactly $2.65, taking a fair average of course, and reckoning fair expense for the labor hired or performed, which is the only fair method of computation.

This is not an attempt to discourage farmers from keeping poultry—far from it; but it is an attempt to show that, as a rule present prices for fresh eggs and fresh dressed poultry are not too high, and that the farmer who raises poultry is not getting too much for his product, in spite of present high prices, which are no more than commensurate with the prices of everything else.

It is not true, of course, that the farmer is getting more for his products than they are worth, and it is probably not true that even the middleman is getting too much for his handling of the goods. But the farmer who deals direct with the consumer saves a profit to which he is himself entitled, and in this way may maks his poultry a profitable investment. But the consumer who reads these reports gets the idea that he is being robbed, and is quite likely to rebel, because he has been misled. Prices are high, to be sure, but they are war prices, controlled by conditions over which neither producer nor consumer has the slightest control.

A careful poultryman, who has a model plant of about 500 birds, and who keeps an accurate account of everything that enters into the business is an authority for the statement that the average cost of producing eggs under conditions as they exist today, is very close to 35c per dozen. This does not mean that there is no profit in poultry, or even that the cost to every farmer will reach 35c per dozen for the eggs. This is the cost where everything has to be purchased. When the farmer raises his own grain, the cost is considerably less, and the profit corespondingly large. But whether the cost is 35 cents or less—and 35 cents should be the maximum under present conditions—there is still a profit for the careful poultryman, and he should not be discouraged if the price of grain continues to advance, for the price of both egss and the dressed poultry is bound to advance in just about the same proportion.

The present prices, except possibly in some few cities, is not more than is reasonable under the conditions which now govern the cost of everything.—H. L. Goodwin, in the Main Journal.

Royal Purple Poultry Specific

Is the big link between few eggs and a full basket.

It Increases the Egg Yield

Feed Royal Purple Poultry Specific to your fowls daily in a hot or cold mash. It will keep your hens active and healthy by assisting them digest and assimilate the food eaten.

If you feed our Poultry Specific according to directions to fowls which are properly housed you will get nearly as many eggs during the winter months as you ordinarily get in the summer. It will pay for itself many times over. Read the following letter from Robt. Cameron, Hensall, Ont.

"I have heen using your Royal Purple Poultry Specific for the past year and it pays for itself many times over in the extra production of eggs, and it makes my hens lay in the winter when the price of eggs is high."

Sold in large and small packages.

80 PAGE BOOK SENT FREE

Send for this valuable hook which describes the common diseases of poultry and stock. It tells how to build and remodel poultry houses and how to raise calves without milk. Write for a copy now.

TEN COMMANDMENTS FOR POULTRY MAN

The ten following rules if observed will aid in increasing egg production:

1. Keep more pure-bred hens of a good laying strain.
2. Keep one breed. the best you can get.
3. Select your breeding eggs from the best layers—the latest hens to molt in the fall and winter.
4. Select large uniform eggs of even shape and color.
5. Hatch pullets in FeFbruary, March and April.
6. Keep plenty of green feed where the hens can graze itr egularly.
7. Provide good feed and housing and provide water in clean vessels.
8. Feed a variety of grains, such as wheat, corn, oats and sunflower seed.
9. Feed a dry mash of corn meal, cottonseed meal, wheat bran and shorts or ground oats.
10. Keep a good scratch of straw and throw all grain feed in it to induce exercise.—Mississippi Exp. Sta.

POULTRY NOTES

In Paris markets, the eggs are dated, and one pays according to the freshness, so that it is possible to be certain of newly-laid eggs; or, if it is necessary to be economical, yesterday's eggs, or the day before, are offered at a reduction.

There are still some people who imagine they can tell the sex of eggs before they are hatched, or as soon as they are laid. Some tell us that long eggs always hatch females while others say that such eggs invariably hatch males. When it is considered that each hen shapes her eggs according to the condition of her ovaries, and uniformly lays eggs of similar shape, the absurdity of the theory becomes apparent.

A fat young guinea is a gamey and savory table fowl, though the flesh is dark.

It takes about two weeks to fat. ten a duck for market.

MAKES HENS LAY!

Right now is the time to use International Poultry Food Tonic. Hens need the regulating effect of this wonderful egg-producer to start them laying and keep them laying. Ordinary feed alone is not enough, they need

INTERNATIONAL POULTRY FOOD TONIC

It is made of roots, herbs, and seeds and is purely medicinal. It will increase your egg-production and your profits many times. Endorsed by Poultry men every where.

The cost of International Poultry Food Tonic is trifling a few cents per week for a large flock. Sold by all dealers in 25c, 50c and $1.00 packages.

Write to-day for a free copy of International Poultry Guide, this book will help solve your poultry problems.

INTERNATIONAL STOCK FOOD CO., LIMITED,

FOR HOME AND COUNTRY

This Department will be utilized to the best interests of the homes in the Maritime Provinces. Subjects relating to household science and all that stands for better homes and communities will be published on this page. The editors, Misses Saunders and Winter, of Fredericton, N. B., solicite your assistance in making this page a success and will be glad to publish tested recipes, household discoveries and other articles useful to the homemaker and women's organizations.

WHAT TUBERCULOSIS IS

If I should tell you in an offhand way that there were millions of tiny plants and animals growing in your body all the time, and feeding upon your flesh and blood, you might think I was joking. But I am not joking at all. This is a fact: If you could look inside of your body with a powerful microscope, you would find there germs of many, many kinds, some of them harmful to your health and others very necessary and helpful.

Among this host of wriggling, jostling germs you would probably find in certain parts of the body a plentiful supply of little rod-shaped plants, known to scientific men as "tubercle bacillli," but to common folks as consumption or tuberculosis germs. These are the tiny parasites that cause tuberculosis or consumption. They are not morethan one-ten thousandth of an inch long and may even be as small as one-one hundred thousandth of an inch. Each time a consumptive spits, he may release countless millions of these bacilli, so small are they. This little plant-like body, once it gets a foothold in the right soil of your body, grows with tremendous rapidity and ten or a dozen soon become a host of thousands and millions. As they grow they do two things, first they destroy the tisues of the body on which they feed, such as those of the lung, for instance; and second, they produce certain poisons which get into the blood and circulate about the body, causing the various symptoms of the disease, of which we shall speak later. This is tuberculosis. You may contract tuberculosis in any part of the body, in the skin, or the foot, or the eye, or the stomach, but by far the most common form of the disease among adults is in the lungs, where it is known as pulmonary tuberculosis or consumption. In children, however, tuberculosis seems to have a preference for the bones and joints, and many of the deformities of childhood, such as hunchback or hip disease, are caused by it.

Tuberculosis is not, and probably cannot be inherited. A person may inherit a weak body or a constitution that is especially liable to infection from tuberculosis germs, but he does not inherit the disease itself. There can be no tuberculosis without the germ, and this germ must be taken into the body from the outside, after birth. You have seen a family where one after another of its members has died from tuberculosis, and you probably have thought that on this account the disease was hereditary. The cause is not hereditary but direct infection. If the consumptive in the home spits his millions of germs about the floor and is careless in the use of his personal utensils and dishes, it is almost certain that some other member or members of the family will be infected by this carelessness. Tuberculosis is almost always spread by such habits as these.

What Causes Tuberculosis

As we have said before there can be no tuberculosis without the germ. This is the real and primary cause of the disease. The germ may enter the body in any one of the three different ways. The comonest way is by inhaling it with the breath. Whenever a person who has the tubercle bacillli in his sputum spits where the discharge is not promptly destroyed, the expectoration dries and germs are left in the form of a very fine powdery mass which floats in the air and mixes with the dust. Hundreds of these tiny dry, but deadly germs may ride upon the speck of dust which you see in the rays o fthe sun. These germs are breathed into the lungs and in turn they cause tuberculosis. They may also be taken in with the breath, when one is standing near a consumptive who is coughing or sneezing. The fine spray, which you cannot see as it comes from the nose or mouth, is laden with deadly germs which you take in with your breath.

A second method by which the germs enter the body is by ingestion, that is, by swallowing them with infected food, milk, etc., Children and particularly babies under two years of age, are most liable to this channel of infection. Milk which is used by children should be of the purest type, and as an additional precaution, it should be pasteurized.

A third, and least common method of infection, is by inoculation through cuts and wounds. The germs sometimes enter a bruise or a cut and produce a loathsome form of tuberculosis of the skin, known as lupus.

Everybody takes the germs of tuberculosis along with millions of other germs into his system all the time. Why then doesn't everybody die of tuberculosis? The reason for this is that the consumption germs cannot live on body tissues that are strong, wholesome, firm, healthy and full of resistance. It is only when these tissues of the body become weak, flabby, diseased and "rundown" or non-resistant, that these tiny marauders find an entrance and eat and destroy the parts of the body on which they lodge.

Thus, while the germ itself is the direct cause of the disease, tuberculosis is caused indirectly by those things which make the body weak and non-resistant. Such things may be a lack of proper food, for example, or overwork and excessive strain. Gases, dusts and various poisons produced by certain trades, such as the stone-cutters, the brass founders, or the printers, may weaken the lungs and prepare the soil in this way for the ready growth of the tuberculosis germ. Living in dirty, crowded and dark rooms makes the body weak and allows the tuberculosis germ to get a foothold. Alcohol is another friend of tuberculosis, and has been a cause of the onslaught of the consumption germ in millions of cases. Certain diseases, such as grippe, colds, pneumonia, measles, typhoid fever, or pleurisy weaken the body so that the germs find certain of its organs an easy prey. In fact, anything you do which tends to weaken your natural and normal health and resistance will act as a predisposing cause to tuberculosis. As long as the body is kept strong, healthy and with full power of resistance, which is its natural state, you need have no fear of tuberculosis. The germs cannot grow in such a body.

Symptoms

Tuberculosis is a most subtle and deceiving disease, because it fastens upon a man before he is aware of it. It is readily curable if discovered in time, but the principal reason so many die with it, is because it is not recognized in its very beginning. When the germs find a lodgment in the lungs, let us say, they do not always notify you of their presence at once. It is only when the poisons whicr they cast off have begun to circulate through your system that you recognize that something is wrong. And even then, you may not think it is anything serious until the disease has made considerable progress. It is important, therefore, that you should know the common symptoms of this disease so that you may be able to detect it readily.

Probably the most common symptom is a persistant cough or cold, lasting for weeks and weeks. Not every long continued cough is a sign of tuberculosis, but if you find yourself coughing for a month or more witout much relief, you may begin to be suspicious of this symptom. Coughing is nature's way of ridding the body of the discharges produced by the germs, as they inflame the tissues of the lunngs or the throat. It is a sign that something is wrong with these organs, and it should ont pass unheeded. Cough is not always, however a symptom of tuberculosis. Sometimes the disease may be well advanced before the patient has any perceptible cough. You cannot tell from one symptom. It takes several together with the skilful attention of a trained physician , to detect the presence of early tuberculosis.

Loss of weight and at the same time a loss of appetite is another symptom produced by the poisons of tuberculosis. This symptom taken together with a sort of "run down" and constantly tired feeling should lead you at once to consult a doctor whether or not a cough or any other symptom is present.

Couple these symptoms, however, to a regular afternoon rise of temperature and to night sweats or fevers, and the condition is one that demands the gravest and most prompt attention from the best possible physician.

Sometimes in the very early stages of the disease the patient is so fortunate as to have a hemorrhage or to find blood in his sputum. I say "fortunate," because there seems to be nothing that wil larouse a man to his need more quickly than this symptom. This sign of tuberculosis and the other mentioned here are not given so that you may be able to diagnose your case yourself with absolute exactness. They are given as danger signals, beyond which you dare not go, except at the peril of your life. They are indications which should direct you at once to the best available physician.

Summing up, you should be examined without delay if you have any of the following symptoms:

1. Being below weight or gradual loss of weight.
2. Being tired all the time or gradual loss of strength.
3. Fever in afternoon (even though slight).
4. A lasting cough or cold.
5. Loss of appetite.
6. Hoarseness, continued or recurring.
7. Night sweats.
8. Spitting blood.

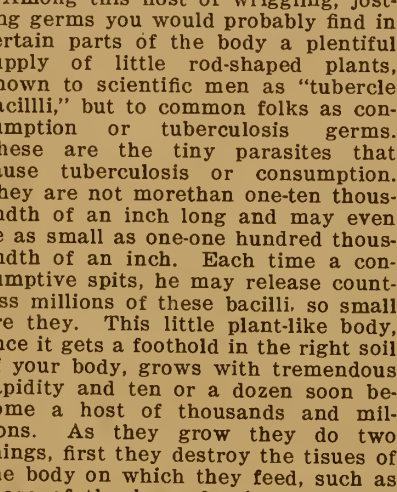
Treatment and Cure.

If a physician could only write out a prescription for the consumptive who calls at his office and tell him to take it and he surely would be cured there would be no question raised as to the possibility of speedy recovery. But when the doctor says, "You need four things to make you well, all of them within your reach, namely, fresh air, rest, wholesome food, and a freedom from worry." many a man thinks the prescription is so absurdly simple that it can never produce a cure. And yet, records of sanatoria show that, where men have folowed this advice and have started in time, 75 percent or more of them have been permanently cured of tuberculosis and the lives of many more have been prolonged for years.

The difference between taking a cure out of a bottle and following the prescribed fresh-air-and-rest treatment, is that the former demands simply punctual dosing with the required medicines, while the latter requires will power, patience, self control, and persistence, all in large quantities. Because many people lack these backbone qualities, they fail in their chase after the cure for tuberculosis.

That consumption can be cured, is demonstrated by the thousands of "graduates" from tuberculosis sanatoria and the army of those who have been cured at home. It is necessary, however, that the disease be recognized early, and the earlier the better.

It is always desirable that a person who has tuberculosis should go to a good canatorium or hospital, for there he will find the best attention and the best support and sympathy in his fight. For taking the cure for tuberculosis is a personal fight, that demands all the best stuff in a man. But if for any reason it is impossible to go to a sanatorium, the cure may be taken in one's own home. The principal things that are necessary are a separate room and bed for the patient, a place to sleep and sit out of doors and quiet and freedom from work and worry. With these things provided.



RELIEF AT LAST

I want to help you if you are suffering from bleeding, itching, blind or protruding Piles. I can tell you how, in your own home and without anyone's assistance, you can apply the best of all treatments.

PILES TREATED AT HOME

I promise to send you a FREE trial of the new absorption treatment, and references from your own locality if you will but write and ask. I assure you of immediate relief. Send no money, but tell others of this offer.

HEART WAS BAD

WOULD WAKEN UP IN DISTRESS.

There is nothing that brings with it such fear of impending death as to wake up in the night with the heart pounding and thumping. This uncertain and irregular heart action causes the greatest distress of both mind and body.

Milburn's Heart and Nerve Pills strengthen and invigorate the heart, so that it beats strong and regular, and tone up the nervous system so that the cause of so much anxiety becomes a thing of the past.

Mr. Archie Beaumont, Edgett's Landing, N.B., writes:—"Have been bothered with my heart and nerves for about six years, caused by overwork and worry. My heart was so bad I would waken up several times during the night in great distress, and my heart thumping. About a year ago I took three boxes of Milburn's Heart and Nerve Pills, and they helped me a great deal."

Milburn's Heart and Nerve Pills are 50c. per box at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

the other essentials of the cure, fresh air, rest and good food, may be secured almost as readily at home as at a sanatorium. If one lives in a district which is reasonably free from smoke and dust and is not very damp, the air may be jut as fresh as in a sanatorium and just as good for the treatment of tuberculosis as the country air. It is not necessary to go to the ment, c.i-s y-e hisd 'LIm (a gkq gk mountains or to Colorado or New Mexico to be cured of tuberculosis. You may be cured almost anywhere, provided you do your part. The cure does not depend so much upon the climate as upon the patient himself. It may be possible for the consumptive to follow the cure for tuberculosis at home under the direction of a physician, and many men have done so and have gotten well.

The principal caution that should be observed in such a case is that of preventing the spread of the disease in the family. There is little reason why a consumptive should not be as safe a person about the house as anyone else. All that is needed is that he use care in the disposal of his sputum discharges. These should be absolutely destroyed. One of the simplest ways is to spit in a small paper napkin and then to fold up the napkin and put it in a paper bag. After a number of expectorations the bag and the contents may be burned up. If such precautions, the use of separate dishes, towels, and other utensils, care in kissing, and ordinary cleanliness are employed, there is little or no danger of infection to other members of the household. It is the careless consumptive who should be feared. The careful one is not a menace to anyone.

One more precaution is necessary, a warning against fake "cures", drugs, etc. advertised to cure tuberculosis. The National Association for the Study and Prevention of Tuberculosis, the highest authority on this subject in America, by special resolution in May, 1913, declared that it knew of no remedy or treatment that would cure tuberculosis other than the well known method I have described here. Every dollar spent on other "cures" is wasted, and every hour given to reliance on such alleged remedies means the loss of precious time that should be used in the right way. There is no druggist, doctor, or mail order concern that can sell you a cure for tuberculosis, all of their advertised lies notwithstanding.

Some Don'ts and Dos.

Don't get tuberculosis yourself; don't give tuberculosis to others.

Don't neglect a cold or a cough, but go to a doctor or a dispensary.

Don't live, study or sleep in rooms where there is no fresh air. Fresh air and sunlight kill the tubercle bacilli and germs causing other diseases. Therefore have as much of both in your room as possible.

Don't spit on the sidewalks, playgrounds, or on the uoors or hallways of your home or school. It spreads disease, and is dangerous, indecent and against the law.

Do not eat food that has been exposed to flies or dust, or touched by unclean hands. Fruit and vegetables should be rinsed or washed thoroughly before using.

Get enough sleep. Most people need 8 hours a day. Growing children need 10 hours. Sleep with windows open, and when possible outdoors.

Take plenty of outdoor exercise. Avoid excess in athletics. Too much exercise may cause heart trouble. Do not eat or drink when overheated. Do not exercise soon after eating.

Take a bath or wash the body with a wet sponge or cloth frequently. If you have no bathtub use the public bath or improvise a tub.

Extent and Prevention

If you stop to think of your friends and relatives, you will not have gone far down the list before you will find a family, one or more of whom have had tuberculosis. In fact, there are very few families in this country, which have not felt the touch of this plague. Is it to be wondered at, when there are 200.000 deaths from this one disease every years in the United States, when one in every ten deaths is caused by it, when today there are no less than a million consumptives in this country? Typhoid fever, diphtheria, smallpox, scarlet fever, and all the other infectious diseases dwindle into insignificance when they are compared even all together, with tuberculosis. Not even cancer, increasing apparently in this country, can equal by one-half the death roll of consumption. ruly Dr. Oliver Wendell Holmes has called it The Great White Plague.

But it is the very wideness of the extent of this disease that has given rise to one of the greatest preventive movements the world has ever known. Beginning in 1904, the great national campaign against tuberculosis in the From a few scattered sanatoria, there have developed a chain of hospitals and allied institutions for the treatment of tuberculosis in almost every state in the Union, over 550 of them altogether. From hardly any effort at organization has grown an organized and cooperating army of over 1,000 United States has developed from a handful to a huge army numbering hundreds of thousands and millions. anti-tuberculosis associations and committees designed to down this plague in their respective communities. Dispensaries, open-air schools, exhibits, lectures, and many other agencies and forms of work have sprung into being to aid the fight against it. From newspapers, schools, theatres, churches, lodge rooms, shops, in fact from almost every possible channel, the truth about the prevention and cure of tuberculosis is being preached and spread.

Tuberculosis can be prevented. It is an infectious disease. We know the germ that causes it. What is needed, is to prevent the spread of the germ. It is to this end that the freat campaign against utberculosis is being directed.

This world-wide war against consumption is seeking to accomplish four things:—

First, the instruction of the people in every possible way concerning the fundamental facts that tuberculosis is a communicable, preventable and curable disease.

Second, the removal and destruction of those causes which tend to

Granny's Talk to Young Mothers

"Granny" Chamberlain

"Few young mothers realize the extent to which a cold lowers the system and makes it susceptible to disease. The majority of diseases arise from germs, but it is not widely known that a healthy system will repel their attacks.

Mothers should never allow a cold to run for 24 hours without attention. If this is made a rule there will be less sickness for young mothers to worry over. A good reliable medicine for coughs, colds, croup and bronchitis should always be kept in the home. You may say that you have no confidence in cough medicines, but that is because you have never tried

Chamberlain's Cough Remedy

the medicine that is thoroughly reliable and has stood the test of half a century. There is nothing in it unsuitable for even the baby.

Yours for Health,
—Granny Chamberlain

A time thief —caught by Gold Dust

Grease is what holds dirt together and, if you let it, this grease will steal your household time—hours and hours and hours of it. But don't let it. Instead let Gold Dust dissolve the grease and *save* your time.

Just try washing some greasy dishes with Gold Dust. See how much time Gold Dust will save—because it more quickly dissolves the grease.

Save still more time by using Gold Dust for any kind of troublesome household dirt, such as finger marks on woodwork, or grease-spots on the kitchen floor.

For time-saving results there's nothing like Gold Dust. For sale everywhere in large and small packages.

make the body weak and non-resistant. This means that the anti-tuberculosis campaign is against dirty, dark and over-crowded tenements; dusty and unsanitary trade processes; the sale of unclean and unwholesome food; and, in general, against anything that is unhealthful.

Third, the destruction of the sputum and other discharges of the consumptive. This may be done through educating the patient to care for himself in the home, or it may require the removal of a dangerous case to a hospital. It is, therefore, necessary that there should be institutions for the homeless, dying and dangerous consumptives who because they are unable to care for themselves properly or are ignorant of the right methods, must be treated in hospitals.

Fourth:—The care of curable cases in sanatoria, and other institutions for that purpose, including open air schools for the treatment of consumptive children and the building up of those who are anaemic and sickly.

How You Can Help

You can have a share in this fight against tuberculosis. Let me tell you a few ways in which you can help.

1. You can see to it that your own physical strength is not depleted by overwork, excessive indulgence in alcoholic liquors, vice, or otherwise.

2. You can demand both for your own safety and for that of your weaker fellows, that your shop or office be clean, sanitary, well lighted and, above all, well ventilated, with an abundance of fresh, pure air.

3. You can insist that your family, yourself included, sleep and live as much as possible in the open air. You can urge the open window especially at night for everyone in the house.

4. You can inform yourself more fully about tuberculosis. The National Association for the Study and Prevention of Tuberculosis, 105 East wenty-second Street, New York City, will gladly send you literature if you will drop them a card and mention what you want.

5. You can stop spitting on the floor or the street and can urge others to follow your example.

6. You can spread the gospel of health by letting someone else read this Bulletin.

WHEN SICKNESS VISITS THE HOME

Although sickness in the home is to be guarded against by observation of the common laws of sanitation, hygiene and dietetics, yet, at some time or other, in spite of precautions, sickness is liable to come into the family. It is only a bit of preparadeness on the part of the efficient home-maker to acquaint herself with some of the simple things that can be performed by anyone that are necessary to the comfort of the patient who is compelled to lie in bed.

It is the custom, at the present time to provide a trained nurse to care for those who are seriously ill, and this should always be done when advised by the attending physician. But in minor or chronic cases, or when a patient is bedridden on account of the infimities of age, it is not ayways possible to secure the services of a trained nurse, or it is too great a tax on the family finances to provide such care and the work must be done by some member of the household.

Even when a family seems to be composed of members whose health is supposedly never failing it is well to be prepared for the emergency of illness to have one bedroom at least that is furnished suitably for use as a sick room, The room should have two windows, if possible, with a floor that has been entirely painted or varnished and supplied with small rugs that can be removed for dusting without moving the bed. It is difficult to keep a carpeted floor in a sick room in a presentable condition and it certainly cannot be kept in a sanitary condition, and it is distressing to a nervous patient to be obliged to see a great deal of work being carried on in the room. Small rugs can be removed and shaken and a bare floor can be cleaned with an oiled dust mop so quietly that the patient scarcely realizes that such work is being performed and the room can be thus kept in a sanitary condition.

Plain wall paper is excellent for any bedroom and is certainly to be advised for a sick room. Sometimes even the inconspicuous stripes of the wall paper become a torment to a sick person who is compelled to gaze on the four walls or the ceiling of one room for many davs and sometimes sleepless night in succesion.

It is a good plan to have at least one single bed in the home that may be used for the sick room, for it is very much easier work to care for a sick person who can be easily reached from either side of the bed. It is a very great strain on the muscles of the shoulders and back of a sick person who is lying in the middle of an ordinary double bed, at arm's length from the nurse. If the bed be low it may be heightened by the addition of blocks to the legs, so that in cases of long illness the care taker will not be physically worn by unnecessary stooping. The springs of the bed should be sufficiently strong to supoprt the body, in sickness or health in a flat, straight position without sagging in the centre and the mattress should be soft and free from lumps.

A wool blanket in the place of the ordinary cotton-filled comforters is light and warm and with the sheets and spread may be washed as often as necessary. In preparing the bed for a patient the pads and sheets should be perfectly smooth and free from wrinkles, the lower sheet should be large enough to fold well under the mattress on all sides. Considerable practise is necessary before an amateur is able to change th bdding skillfully, but if a plan is studied out and

A MESSAGE TO WOMEN!!

LET a woman ease your suffering. I want you to write, and let me tell you of my simple method of home treatment, send you ten days' free trial, postpaid, and put you in touch with women in Canada who will gladly tell what my method has done for them.

If you are troubled with weak, tired feelings, headache, backache, bearing down sensations, bladder weakness, constipation, catarrhal conditions, pain in the sides, regularly or irregularly, bloating, sense of falling or misplacement of internal organs, nervousness, desire to cry, palpitation, hot flashes, dark rings under the eyes, or a loss of interest in life, write to me to-day. Address:

Mrs. M. Summers, Box 309 Windsor, Ont.

BOY'S RUSSIAN SUIT.

By Anabel Worthington.

Again and again fashion demonstrates that for the little lad up to six years of age no other style can quite take the place of the Russian suit. It enjoys popularity because the mothers have agreed that it always looks neat, is the easiest kind of suit to cut out and make, and with its plain lines and coat closing is very easy to launder when made of a tub fabric.

The illustration shows this distinctively boyish suit to be all that is correct and desirable for the small boy. At a lowered waistline the blouse is belted with self material, neatly confining the fulness. Banding in contrasting color gives a practical but pretty trimming touch to the low round collar, the pocket, belt and edge of the overlapping front. The sleeve is uncuffed, fitted at the lower part with box plaits. Either the straight or bloomer trousers may be chosen.

For a play garment St. Nicholas cloth, gingham, linen and the new cotton-covert cloth are suitable weaves for selection. For kindergarten wear serge, homespun, cheviot and the wool mixtures are excellent materials. Of course, velvet and corduroy may be considered also. There is no difficulty to meet in copying the design—the illustration instructions make every step so clear that a school girl can successfully reproduce the design.

The suit pattern, No. 8,054, cuts in sizes 2, 4 and 6 years. To make in medium size requires 2½ yards 36 inch material, making either trousers; 4⅜ yards of banding

To obtain the pattern send to the office of this publication.

She Often Had to Lay Off For a Day

MRS. MANTLE TELLS WHY SHE USED DODD'S KIDNEY PILLS

Results, She States, Were So Good That She Recommends Them to All Sufferers From Kidney Disease.

St. John, N.B., Feby. 17th, (Special.)—Mrs. Mantle, an estimable lady living at 117 King St. East, this city, is always ready to tell of the benefit she has received from using Dodd's Kidney Pills.

"Yes, Dodd's Kidney Pills have done me a wonderful lot of good." Mrs. Mantle told an interviewer. "For three years I was in a worn-out condition, often having to lay off for a day or two.

"I suffered from drowsiness and sharp pains across my back. I had headaches, and was subject to neuralgia and rheumatism.

"Dodd's Kidney Pills helped me so much that I can highly recommend them to anyone suffering from kidney disease."

Dodd's Kidney Pills are purely a kidney remedy. Making the kidneys healthy enables them to strain all the impurities out of the blood. That means pure blood and good health. Dodd's Kidiney Pills are recommended by thousands of women who were once run down and worn out.

GIRL'S DRESS.

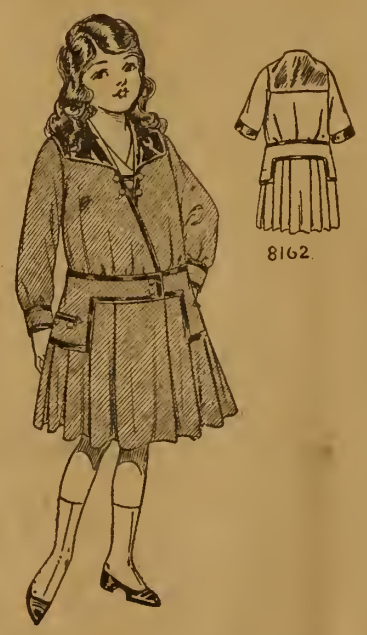
By Anabel Worthington.

It had to be, of course, that Fashion would favor the small girl just as she did mother, and make her new spring dress with a vest and a separate belt and show the panel front effect so that life would be really perfect.

The fronts of the plain waist are lapped over the surplice vest, so as to give diagonal closing; the strap trimming just below the collar gives added attraction to the vest in light tone. The sleeve is easily full and may be short with a band finish or long with a wristband cuff of material trimmed with bands of contrasting goods to match the square collar. A two gore plaited skirt is joined at normal waist li , where the separate belt is arranged; the belt has its sides lengthened to form pockets, the pocket opening being bound with satin.

Light weight woolen goods, serge, gabardine, poplin, linen or cotton weave may be chosen for this model. In linen or cotton a piping of contrasting color goods will be as effective as the silk or satin trimming on a dress of woolen material. If you really want to "dress up" your daughter at small cost, buy the pattern and copy this simple frock.

The dress pattern No. 8,162 cuts in sizes 6 to 12 years. To make in size 8 requires 3½ yards 36 inch material, ½ yard 36 inch contrasting goods and ½ yard 22 inch linen or silk for vest.



To obtain the pattern, send to the office of this publication.

Fashions Dept.

How to Order Patterns.

Order by number, giving age or measurement as required, and allowing at least ten days to receive pattern. Also state in which issue pattern appeared. If two numbers appear for the one suit, one for coat, the other for skirt, thirty cents must be sent. Address Fashion Department, "The Maritime Farmer, Sussex, N. B. Be sure to sign your name when ordering patterns. Many forget to do this.

Positively no patterns will be sold under 15 cents each, owing to advance in cost of same.

When ordering, please use this form:—

Send the following pattern to:

Name .....

Post Office.....

County .....

Province .....

Number of Pattern.....

Age (if child or misses' pattern).....

Measurement—Waist .....Bust.....

Date of issue in which pattern appeared. .....

followed each time even that will become a simple matter.

A smiling face and a readiness to accept with seeming calmness the whims of a weary patient are necessary adjuncts on the part of the nurse and will go a long way toward making the sick room a pleasant place. Pleasant surroundings, cheerful conversation, good food, good care, plenty of fresh air and strict adherence to the adivce of a reliable physician, are all necessary to the recovery of those who are suffering from the effects of disease.

ENLARGED GLANDS

Lymphadennitis is inammation of a lymph gland, and follows an invasion by some infestious germ. The first step in treating is to ascertain the nature of the germ that is causing the trouble. In cases of chronic lymphadenitis in the neck, physicians often trace the infection to trouble with the nose or throat. As soon as any neck swellings develop in a child the throat should be examined for enlarged tonsils or adenoids and the mouth for decayed teeth. If the trouble comes from any of those souces, correcting them usually results in a gradual decrease in the size of the swelling.

If, after all these precautions have been taken, the swelling remains as large as before, or even grows worse, it is time to suspect tuberculosis lymphadenitis — a common chronic trouble in childhood. nIthese cases the first duty is to make very sure of the milk supply.

If possible the child should drink only milk that comes from cows that have been tested for tuberculosis. If that is not posible, then the milk should always be Pasteurized or boiled. The tuberculim-tested milk is the best, because its food value is not impaired.

Sometimes, in spite of all that can be done, an enlarged gland softens, and the surface of the skin shows signs that breaking down will occur, Under these conditions a surgeon should remove the gland without loss of time.

But operation or no operation, when children have enlarged glands in the neck or elsewhere they should always be placed under the care of the physician. Very often well-meaning mothers make local applications that do more harm than good, because they hasten the softening that is so much to be dreaded. What is true of opplications is also true of handling or rubbing. Mothers and nurses, more energetic than wise, have been known to spend much time on massage, with the worst possible results. All tuberculous processes and glandular swellings should be kept as quiet as possible. For that reason, if the swelling occurs on some part of the body where there is much movement, such as the groin, the patient should either remain in bed or the part affected should be made immovable by means of splints and bandages. An open-air life and nourishing food are essential for everything possible must be done to maintain the general health. The enemy as yet has gained only a local footing; the fight must be to prevent the disease from becoming general and constitutional.

TO REMOVE INK

Ink spilled on the carpet may be taken out without leaving a stain if dry salt is applied immediately. As the salt becomes discolored brush it off and apply more. Wet slightly. Continue until ink has disappeared.

So long as there is work to do there will be interruptions—breaks in its progress. And it is a part of one's character growth to bear these timely or untimely interruptions without any break in good temper or courtesy.—Business Man's Calendar.

To make vinegar from cider, to each 2 quarts of cider add 1 cup molasses and ½ cup yeast; keep covered where the temperature is 70 degrees to 90 degrees, and it will soon make vinegar; then draw it from the dregs, and keep in a jug, or bottles, tightly corked. Cider from vinegar, should be made from good sound apples. The cider made last fall will be alright.

Real Home Made Pie—

Yes, Ma'am!
Real homemade Pie!

With top and under crust that truly melt in your mouth—and a generous filling of your own delicious homemade preserves or home-grown fruit.

That's a pie worth eating, and worthy of your baking, and it's the kind of pie you can make every time with

BEAVER FLOUR

MILLED OF BLENDED WHEAT

"Beaver" Flour equals any of the "special pastry flours" because it is, in itself, a special pastry flour—being the choicest Ontario fall wheat, blended with western spring wheat to give it strength.

This is why Pies, Cakes, Cookies, Tarts, Doughnuts, Buns and Fancy Pastry —when made with "Beaver" Flour—are so light, so flaky, so uniformly good.

This is also why the Bread and Rolls—made with "Beaver" Flour—have a delicate, nutlike flavour that is totally lacking in western spring wheat flours.

Just try "Beaver" Flour for anything you are baking—and see what happy results you get, every time.

EFFICIENCY

By Mrs. A. G. Dickson, Centre Napan, N. B.

At no time, perhaps, in the worlds history has there been so great need for efficiency as during this period of the great struggle of Nations for might against right; all our resources need to be developed and conserved as in no other period. The products of the forest, mine and field are needed in immeasurable quantities and efficient workers of all classes are in great demand.

We of the allied forces are fighting a foe, who as a nation has attained an efficiency which enables them, after years of fighting, to be still 'foemen worthy of our steel." How have they attained this proficiency? Perhaps we may be able to learn from them how to make our nation a great power, which may be used for the uplift and benefit of mankind instead of for world dominance.

Wise people tell us that it was in the schools of Germany, that the sinister powers of that brilliantly clever land sowed the seed that has brought upon this beautiful world the most horrible calamities that it has ever known. The doctrine of Militarism was taught persistently in the schools. Think of the influence of the schools; if militarism can be taught there with such powerful results why not character, service, brotherhood of man?

A nations best asset is not its crops, cattle, sheep, forests, fisheries and mines, but its children. A nations future greatness therefore depends principally on its children. Let us, who are proud of being Canadians aim in every possible way to assist in raising up an efficient people to replace so many of our bravest and best who have done their bit for Canada and world freedom and are laid to rest somewhere in France.

I believe the teachers in our schools, more than any other, have the opportunity of moulding the minds of our boys and girls. How important that they should realize the great charge laid upon them. It is not so much the mental development of our children it is their moral and physical good, that shall I say, is most important. Children who are taught to do each little duty to the best of their ability, to be truthful, courteous and thoughtful of others, are building characters which will make of them efficient men and women in whatever calling of life they may persue; for if they are careful in small things they will also be careful in great places, should they travel so far.

That efficiency is demanded of us there can be no doubt. We have the injunction iven by our greatest authority "whatsoever thy hand findeth to do, do it with thy might."

Our boys after school should learn to do, that thing well, for which they are best fitted. The world today demands experts in all trades and callings. Our girls should learn to be experts in household management, food values and preparation, sewing, laundry work and all arts which will help them to make a happy home. They may take up other useful work and do it well, but all paths for them lead usually to the home.

How important then that they be taught to be efficient home-makers which is, after all, the greatest profession for women.

I might say in closing that the Government of any country is a great factor in developing the efficiency of its people. They control our schools; we want the best kind of education for our children; we want their physical well-being cared for. Good roads in rural sections make for greater efficiency. I know our Government is anxious to assist Agriculture in all possible ways. Let us ask of them, those helps which the country most needs.

"God give us men, a time like this demands
Great hearts, strong minds, true faith and willing hands.
Men whom the lust of office does not kill;
Men whom the spoils of office cannot buy;
Men who possess opinions and a will;
Men who have honor, men who will not lie.
For while the rabble with their thumworn creeds,
Their large professions and their little deeds
Wrangle in selfish strife—lo! Freedom weeps.
Wrong rules the land and waiting Justice sleeps."

Nerves of the Stomach

Were Weak and Inactive as Result of Nervous Prostration—Lost Twenty Pounds—Had to Take Sleeping Powders to Get Any Rest

Many people never realize that the movement and action of every organ of the human body is dependent upon the energy supplied by the nervous system.

When the nervous system gets run down there is weakness throughout the entire body. You feel tired and languid and your stomach and other digestive organs are similarly affected. Appetite fails, digestion is poor, you do not get the good of what you eat and gradually grow weaker and weaker.

This process can only be stopped by such treatment as Dr. Chase's Nerve Food, which goes directly to create new nerve force and thereby to invigorate the whole human body.

Mrs. Geo. S. Ellse, 46 Davidson street, St. Catherines, Ont., writes: "My husband had an attack of nervous prostration, and, although he doctored for some time and tried different other medicines, he could noe get relief. He had to resort to sleeping powders given him by the doctor to make him sleep. The greater part of the trouble seemed to be with the nerves of the stomach. He began to lose weight and kept on going down until he had lost twenty pounds. We had read advertisements in the newspapers for Dr. Chase's Nerve Food, and noticed that it seemed to be doing a lot of good for people troubled with nervousness, so my husband decided to try it. He found benefit almost from the start, and continued this treatment until he had taken about twelve or thirteen boxes. The resuts were most satisfactory. He is now enjoying good health, sleeps well, and has gained back nearly all the weight he had lost. He also uses Dr. Chase's Kidney-Liver Pills occasionally, and thinks them an excellent remedy. I have also used this latter medicine for dizzy spells and liver trouble, and was completely cured of these complaints. We think a great deal of Dr. Chase's medicines, and cnnot speak too highly of them."

Dr. Chase's Nerve food, 50 cents a box, a full treatment of 6 boxes for $2.75, at all dealers, or Edmanson, Bates & Co., Limlted, Toronto. Do not be talked into accepting a substitute. Imitations only disappoint.

THE HOME GUARD

Taken from the December, 1917, number of The Journal of Home Economics.

"I don't like to leave home," said Sergeant Sugar doubtfully. "After all, they depend pretty much on me over here in the United States."

"Don't be a Slacker," admonished Lieutenant Lard.

"No time to argue, boys, forward march!" came the sharp command from General Wheat. "Off to France—but halt—what's the matter, Sergeant Sugar?"

"The children are so fond of me, General. I don't see how I can get away."

"Do you boys imagine for a minute that you are leaving the folks at home without any protection? How about it? Did you think that, Major Meat?"

"I didn't exactly think that, sir," came the cautious reply.

"Attention! Do you see that encampment to the right " Yes, sir!"

"That encampment is only one of several hundred squadrons which we are leaving here. Enlisted in the Home Defense League is General Milk, known throughout the world, probably one of the ablest military-food experts in the world, absolutely unsurpassed for efficiency. He is a man of somewhat your type, Major Meat.

"Then there is Colonel Corn. Colonel Corn is a fellow who has been hiding his light under a bushel. Ha! Ha. Yes, everybody in the South has known him for years, I know, but why his fame didn't spread up North I can't understand. I can tell you I have absolutely no compunctions about leaving home when I know I'm leaving a fellow like Corn to look after things.

"Now, just a word to you, Sergeant Sugar. Ever heard of your superior officer, Major Molasses?" "Yes, sir, but——"

"No 'but's', Sergeant. I want you to know that Major Molasses is a fellow who can fully as well look after the sweet teeth of American children as you can, Sergeant." 'Yes, sir."

"Very good. Perhaps you'd like to hear the names of some of the other officers. Major Meat, you may be interested to know that Captain Cheese and Lieutenant Fish are ready to carry on quite a bit of the work which you must necessarily leave when you go to France.

"And then there's Sergeant Spud, who is going to be able to do a great deal this winter. He's what I call a good officer." "Yes, sir."

"There's a young Corporal in the Home Defense who'll do a great deal of what you might do if you could stay, Lieutenant Lard."

"Who is that, sir?"

"Corporal Cooking Oil. He's one of the Vegetable Fat Family. I understand that your family used to consider yourselves somewhat better than the Vegetable Fats, eh Lard? Well, war is a great leveller. I imagine the young fellow will be giving you a good run for your money before long. Well, boys, see you're not quite so important after all. And it's on to France, is it?" "It is indeed, sir "

"To the front then! May fortune bless our voyage! Forward March!"

HOME CULTURE

By Mrs. M. Dunphy, Lower Kingsclear, N. B.

I think perhaps there is not as much attention given to Home Culture as there should be. We are more apt to want our children to shine (as we sometimes say) in society more than in the home, therefore Home Culture is more or less neglected; but I think if we look at it in the right way it should be a matter of great importance to every one of us for upon it depends the happiness of our homes. One writer tells us the laws of good breeding in no place bear more gratifying results than in the home circle; tempered with love, and nurtured by kindly impulse they bear choicest fruit.

A true Lady will show as much courtsey and observe the duties of politeness as unfailingly toward every member of her family as toward her most distinguished guest. I am afraid we do not do it as much as we should. We should never forget the first book children read is their parent's example. If this is forgotten we may find in the loss of our domestic peace that while our children well know the right path, they may follow the wrong. An impious, profane, or

CAUGHT COLD NEGLECTED IT

WAS SICK FOR MONTHS.

You should never neglect a cold, however slight. If you do not treat it in time it will, in all possibility, develop into bronchitis, pneumonia, asthma, or some other serious throat or lung trouble.

On the first sign of a cold or cough it is advisable to cure it at once, and not let it run on for an indefinite period.

For this purpose there is nothing to equal Dr. Wood's Norway Pine Syrup, a remedy that has been universally used by thousands for over twenty-five years.

You do not experiment when you buy it.

Mrs. W. G. Paquet, Smith's Falls, Ont., writes:—"I was troubled with lagrippe. I caught cold, and neglected it, and was sick for several months. I took three bottles of Dr. Wood's Norway Pine Syrup, and before I finished the last one I was entirely cured. I would not have any other cough medicine in the house.

It also cured my baby, who was very sick with bronchitis. She had the doctor three times, and he recommended 'Dr. Wood's.' I highly recommend it to those who need a quick cure."

See that you get Dr. Wood's Norway Pine Syrup when you ask for it. Do not accept a substitute. It is put up in a yellow wrapper; three pine trees the trade mark; price 25c. and 50c.; manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

The Nova Scotia "Lumber King" says:

"I consider MINARD'S LINIMENT the best LINIMENT in use.

"I got my foot badly jammed lately. I bathed it wtll with MINARD'S LINIMENT and it was as well as ever next day.

T. G. McMULLEN.
Yours very truly,

vulgar word or thought may operate upon the heart of a young child, like a careless spray of water upon polished steel, staining with rust that no efforts can thoroughly efface. Improve the first ten years of life as a golden opportunity. IT is the seed time, and your harvest depends upon seed then sown.

Another thing is yielding to one another. One of the greatest disciplines of human life is that which teaches us to yield our wills to those who have a claim on us; even in trifling every day affairs the wife to husband, children to parents and to one another. In cases where principle is concerned it is of course necessary to be lrm and that often requires moral courage which should be taught more in our homes. Moral courage is a rare endowment and those who possess it are able to act with perfect independence of the opinions of others and govern themselves only by the laws of propriety, uprightness and charity.

Few mothers can overestimate the influence which the companionship of books exerts in youth upon the habits and tastes of their children, therefore we as mothers who have the welfare of our children at heart, will not neglect the choosing of proper books for them to read. While they are under our care we should select for them such as will interest and instruct. The poison imbibed from bad books work so secretly that their influence for evil is sometimes worse than the influence of bad associates. A taste may be easily cultivated for books with good wholesome reading as well as being instructive and interesting. I think you will agree with me in saying the Bible is the very best Guide we can have in teaching Home Culture. It is well to remember that every blessing of our lives, every joy of our hearts, and every ray of hope shed upon our pathway have had their origin in religion and may be traced to the influence of Bible teaching. In the earliest days the mind should be impressed and stored with religious truth. It should be taught so early that the mind will never remember when it began to learn; it will then have the character of innate, inbred principles incorporated within their very being.

ECONOMICAL FUN

The American Cookery magazine in his January issue, suggests a way to entertain in war-time. This may be an idea for Women's Institutes when they are entertaining the gentlemen.

"We had been preaching and practicing economy, and having it preached to us, for so long, that our club decided, as an antidote, to see if it couldn't furnish us with a little fun as well. So we gave an ECONOMY TEA.

The invitations were written on common wrapping paper, neatly trimmed, and bore the following jingle:

Wear a cotton dress
Or a last years suit;
A hat out of date
Or a leatherless boot.
Something to show,
Like the F.A.C.,
You believe in
The strictest economy.

The only decorations were American flags and some bunting. For place cards for the women we used white cards to which were glued bone buttons (the kind with two holes). A face was drawn on each button, with the two holes to represent eyes, and below these were pasted headless pictures illustrating some phase of economy in its relation to the war. For instance, there was a woman with a hoe, one seated at a sewing machine, another canning fruit, a Red Cross nurse, a cook, a woman chauffeur and an aviatrix.

The cards for the men consisted of an acrostic of the word 'Economy'—one letter to each card, suggesting some needed economy.

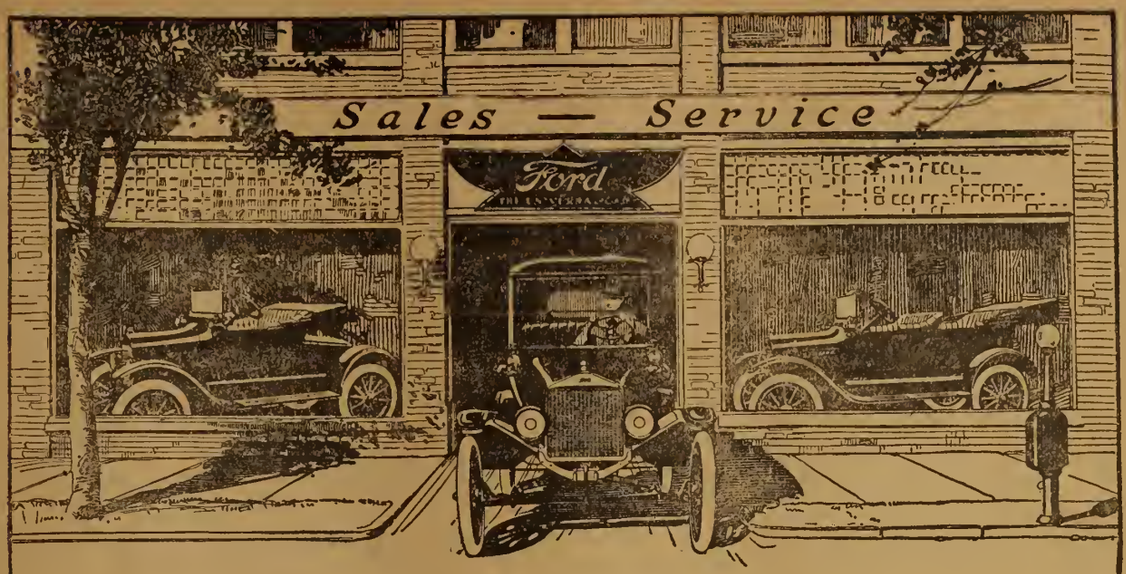
E stands for Eating—it makes you too fat.
C for Cigars—no money for that!
O for Onions—you're wasting your strength.
N for None—your share of the cake.
O for Oats you must share with the horse.
M for the Meat you must give up, of course.
Y for the Yolks of the eggs you forsake

For stunts, we passed paper and pencils to the men and asked them to design a dress that could be made out of three yards of blue serge, two yards of blue silk, and a yard of chiffon. The women were asked to see what they could do (on paper) with six nails and two boards. For their sharpness in creating the best designs, the prize in the men's contest was a paper of pins, and in the women's a box of tacks.

Another contest was called 'Intensified Farming.' To the one who succeeded in raising the greatest number of vegetables in a given area of paper was presented a hoe.

For refreshments, we had tea and hard tack of wafers (made by spreading a paste of cornmeal, sugar and cinnamon, wet with a little water, on square crackers that had been lightly buttered, and browned in a slow oven), eggless cake and short ration sandwiches, made of war bread spread with a filling of boiled beef, macaroni, celery and a bit of onion ground together and mixed with boiled mayonnaise, and cut into very small portions.

A kitchen range can be kept beautiful by simply rubbing it over with a small piece of suet, and then polishing with newspaper.



Complete Service to Ford Owners Everywhere

COURTEOUS attention to your needs wherever you may travel is something you appreciate, and being a Ford owner you can get it. You are always "among friends".

There are more than 700 Ford Dealer Service Stations throughout Canada. These are always within easy reach of Ford owners —for gasoline, oil, tires, repairs, accessories, expert advice or motor adjustments.

The cost of Ford Service is as remarkably low as the cost of the car itself. Nineteen of the most called for parts cost only $5.40. Just compare this with the cost of spare parts for other cars and you will realize the advantage of owning a Ford.

AGRICULTURAL RELIEF OF THE ALLIES FUND

The following letter from Dr. Robertson, Chirman of the Canadian Branch of the Agricultural Relief of the Allies Fund, was read at the reent meeting of the N. S. F. A. at Truro.

To the Nova Scotia Farmers' Association, in Annual Meeting assembled:

I regret that duties in connection with patriotic work and war-service of various kinds prevents me from attending the annual convention. Under the circumstances I am glad to avail myself of the opportunity to send a message. In it I wish to remind you of two matters and to invite your kindly consideration, to be followed, I hope, by action in keeping with your opportunities and the circumstances.

The first is in reference to the food situation; the other is the special appeal made to the farmers of Nova Scotia to join other farmers in providing first-aid for the peasant farmers of our Allies who have lost everything through the awful process of war.

Gravity of the Food Situation

The scarcity of suitable foods is causing the war situation to become increasingly grave on the side of the Allies. France and Italy are short of wheat and fiour and fats. There is not enough food on our side to let us be free from anxiety; and if we all eat and waste, then there will be still greater privation among our Allies—privation which may mean starvation for women and children and the weakening of our position in the war. That is the gravity of the food situation.

Why did we not know about that sooner? Well, the men at the heart of things have known it, but the people would not hear or heed because the abundance all about us was so great. I sometimes think, with my body in Ottawa and my mind behind the lines at the front.—If they hear not Moses and the prophets, (men of intelligence, vision and responsibility) neither would they be persuaded although one of our soldiers rose from the dead and said, "You folks at home are putting in peril all that I died for."

Since the war began the farmers of Nova Scotia have risen to the great occasion nobly. Scme of the best of them have sealed their devotion by the supreme sacrifice of Service unto death in Belgium and France. Those at home have spared sons and brothers for the army until the farms are stripped almost bare of necessary labor. I honor the men and women who have toiled bravely, early and late, to the last ounce of their strength. It has been for a great cause. Now, as ever, he that endureth to the end shall be saved. So must we not now slacken our efforts. The logical sequence to the work that has been done for greater production is to follow it by a further effort ofr still greater production. We should use all the experience we have thus far gained in planing and carrying forward a campaign for larger acreages and higher yeilds in 1918 and the years that are to follow.

I do not want to urge you to do more than you can do. I would like you to understand the situation, and leave it with you to do alk you can to make sure that every bit of food that can be saved for the Allies and the armies is being saved; and that every pound and bushel of food that can be produced in Nova Scotia will be produced. I pray that the Almighty may give you health and strength of body, mind and soul for your heavy tasks and that He may crown your labors by the blesing of a good harvest.

First Aid for the Peasant Farmers of Our Aleils

And now may I turn your thoughts for a few minutes to the plight of brother farmers in the devasted regions of our Allies, who have lost everything by the dreadful processes of war. Candadians and more particularly Canadian Farmers have been asked to contribute to the British Agricultural Relief of the Allies Fund. A representative Committee has charge of the campaign in Canada. His Excellency, the Governor-General is patron. The Right Honourable Sir Robert Borden and the Right Honourable Sir Wilfrid Laurier are Honorary Presidents.

A Provincial Committee under the chairmanship of Profesor Cumming and having as its members Professor W. S. Blair, Mr. S. J. Moore, officers of your association and others, has charge of the campaign in this province. Associated with them are other men of worthy public spirit. The farmers of Canada are being invited to regard February as the RELIEF MONTH FOR BROTHER FARMERS IN THE DEVASTED REGIONS. The object is to provide seeds, agricultural machinery, live stock, etc., to help the peasant farmers whose farms have been devasted by war wanton destruction by the enemy, to make a fresh start.

By the kind co-operation of the various banks, the Managers of the branches of chratered banks will receive contributions and forward them to the Honorary Treasurer of your Provincial Committee.

We all sympathize deeply with those on whom has fallen much more than theis share of the losses and havoc of war. In some places the land itself is torn beyond any posible recovery into use for growing crops. The farmers of the whole British Empire want to help these brother farmers to get on their feet as soon as they get back possession of their farms. Their houses and machinery have been destroyed. They have nothing left with which to begin farming again. We, on the other hand, have lost nothing as farmers through the war; but in some cases have made money because of the increase in prices. We ought to help our stricken brethren as soon as the enemy is pushed ont of their countries. We want to do that for several reasons. The object is humane and we are a humane people. They are our allies, our neighbors and our friends. We want to help them for the sake of the good name of Canada. It wouldu be a good thing in our international relations to have it known that the dairymen of Canada gave something, a good thing to have it known that our grain growers gave something, a good thing to have it known that our grain growers gave something, a good thing to have it known our live stock men gave something, that our poultrymen and fruit growers have given something, and above all that our country women have remembered their sisters whose farm homes have to be re-established out of ruins. We want for Canada a place among the nations, on behalf of our farmers which will be in keeping with what our sons and brothers have won on the fields of battle.

For all these reasons may I suggest that you think kindly of giving substantial aid to the Fund for these peasant farmers who have suffered. You will never miss it; it will be laid up where neither moth nor rust doth corrupt, and where thieves do not break through nor steal. It will be to your everlasting credit.

With all good wishes and confidence

Shipping space to Europe is so scarce that thousands of tons of urgently needed war supplies are held on North American docks awaiting transportation. Even though willing to pay double or treble rates, shippers cannot get their goods through.

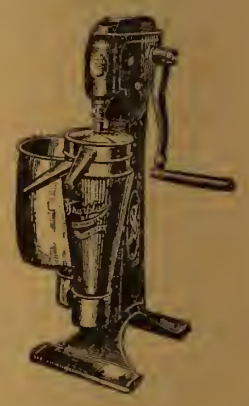
Separators Given Priority Over War Materials

A FEW weeks ago, under authority of the French government, a shipment of five hundred Sharples Suction-feed Separators was *promptly* forwarded from here to France. The very next week another order for five hundred Sharples Suction-feed Separators was received and forwarded under similar conditions.

Both shipments were given precedence en route. Munitions might wait. Even food products might wait. But this machine that *saves* butter fat wasted by every other separator or method, was placed in the very vanguard of life's necessities.

It has been said that not munitions, not even money will win the war—but fats.

The English Government recognizes this. On December 22nd, we received the largest order for Sharples Suction-feed Separators our agents there have ever given us. Immediate shipping space was provided by the English Government.



And no wonder they are achieving first place—not merely first place among separators but among economic inventions that have made North America great.

SHARPLES

The One and Only Separator

—that will skim clean at widely varying speeds.
—that gives cream of unchanging thickness—all speeds.
—that will skim your milk quicker when you turn faster.
—with just *one* piece in bowl—no discs, easiest to clean.
—with knee-low supply tank and once-a-month oiling.

Sharples is the only separator that automatically and fully prevents cream losses. No matter whether turned fast or slow, the Sharples Suction-feed principle insures clean skimming. Not less than ten pounds of butter per year for every cow is the average saving over any other separator. No wonder they want them in Europe!

See the nearest Sharples dealer at once. He probably advertises in your local paper. If you do not know his name, ask us and we will send it, together with a copy of our 50-page, old-time Song Book in appreciation of your interest. Address Dept. 79 for this information and catalog.

TORONTO, ONT. THE SHARPLES SEPARATOR CO. REGINA, SASK.

TC-1

in your response to the two objects for which I have ventured to appeal.

I am,

Your friend,

J. W. M. ROBERTSON.

The foregoing letter was referred to a committee for action. Following is their report.

Report of Committee on Dr. J. W. Robertson's Address

Your Commitee beg leave to submit the following report:

We have gone over Dr. Robertson's address very carefully and we are seriously impressed by his timely and eloquent communication and consider that our attention has been attracted to the serious condition of our brother farmers of the Allies in the devatsed area in a manner that could not possibly be done in the ordinary way of newspaper advertising. Therefore we recommend the following suggestions for your favorable consideration:

We are asked to do our utmost for greater production for National Service and while we are willing and fully resolved to do our best, we find ourselves constantly handicapped for want of suitable help on our farms and therefore we would advise this Association to memoralize the Provincial Government to assist the farmers through a Labor Commissioner to secure all the available help possible in order that we may be able to carry out our plans for greater production.

Also we find mill feeds are scarce and high in price, and liable to be scarcer on account of the new mill regulations by the Food Controller, therefore we advise some steps be taken to protect ourselves by way of securing these feeds and also the transportation of same.

With regard sto the second part of the address pertaining to the relief of our brother farmers in the devasted area of the war zone, we take pleasure in recommending that this Association express in a practical way our sympathy and interest in their very serious condition to give the fund a good start in Nova Scotia, and the amount contributed be handed over to the Commitete in charge of the fund.

We also advise that the delegates here on their return home, urge upon the executive committees of their respctive county Farmers Associatoins and Agricultural Societies to raise as large a fund as possible in their counties by an advertising campaign for this purpose.

We also want to remind you that February is regarded as the Farmers' Relief month and the work should be completed during that month.

Finally we recommend that this convention express its apreciation of Dr. Robertson's splendid and thoughtful communication.

J. HOWE COX,
S. FREEMAN,
FATER McISAAC.

PRESIDENT MURRAY'S ADDRESS AT THE N. S. F. A., TRURO

(Continued from page 192)

even if not as good as we would wish, to realize it and select the best we can out of it so as to get the very best returns we can. It certainly will all be needed.

Fertilizers are dearer than ever before and some brands not obtainable at any price, so my advice is to get what you can, if you cannnot get what you want, and get it as soon as you can so as to have it as there will be a large number of orders not filled this year.

Now, Gentlemen, at the present time in our lives there are some things talked of so much and constantly reported that they get tiresome, but the seriousness of the situation is excuse enough for the constant repetition of them. The food controllers of Canada and the United States tell us that unless we make an extra effort this present year that our enemies will have a great advantage over us and that the most serious shortage is going to be in bacon, wheat and meats of all kinds. Now if each of us only sow one bushel more of wheat this year you can scarcely grasp what it would mean to the empire. And if those of us who can will keep an extra pig to raise a litter or two of little ones we are surely doing something to help the cause along. there is also one thing more which we can do which will greatly add to our meat supply and also give a good profit in other directions and that is to have our sheep protected in a more practical manner. There was quite a good sheep and dog law passed here at our last annual convention but for lack of supoprt from those who should back it up, (that is the farmers all over the province) it did not become law. Now, gentlemen, don't you think that the time has come when we ought to get together on this subject and have something done? Would it be any serious loss to this province if there was not one dog in Nova Scotia? Would not the food which is consumed by them be put to much better use in raising pigs? Just think for one moment what a boom there would be in sheep raising if the dogs wouuld be instantly put out of existence. Well it is up to you. Now is the time to get anything in the way of protection for any branch of your industry that will help the cause along, and this is surely one of them.

Now, gentlemen. I presume that a number of you find, as I do, that you are forced back into the thick of the work owing to the scarcity of help. Those whom you figured would take up the heavy part of it are called to face the foe. Well let us do our part as well as those of our blood who are in the line and we will not blush when we sing, "God Save the King."

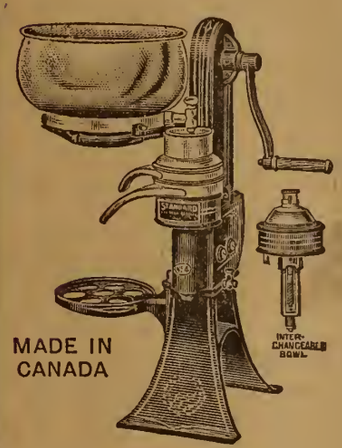
Practical Patriotism!

IN these times of national stress, the country implores the people to conserve every resource. Keeping your money investments confined to Canada is splendid patriotism, and good, sound business, too. Besides, you can easily prove to yourself that it is profitable patriotism for you to invest in the

Renfrew

—the machine that is entirely made and designed in Canada by Canadians.

The Renfrew saves one-half pound of valuable cream per cow per week over other machines. By its unequalled close skimming it gets all but one-tenth pound of butter-fat from 1000 pounds of milk skimmed, while other separators lose one-half to a whole pound.



The Renfrew's close skimming is proven by Government Dairy School tests. We are always glad to have the Renfrew tested beside any other separator, wherever made.

Send for interesting literature, describing the Renfrew self-oiling system, low supply can, interchangeable capacity and other features that are creating big demand for this made-in-Canada machine all over Canada, in the United States and other countries. Write to-day.

"The Canadian farmer hands his money to the Canadian manufacturer, who in turn pays wages to his employees. The money is then turned over to the Canadian merchant for produce bought from the Canadian farmer. Therefore money paid out by the Canadian farmer for Canadian-made machinery comes back to him in actual cash, and in the form of better markets for his produce. Money paid for foreign-made machines is immediately sent out of the country, perhaps never to return."

NOTICE: The Renfrew Separator illustrated here was formerly sold under the name "Standard", which identified it as a high efficiency cream separator. The name "Renfrew" has been used on the same machine for several years for our United States and foreign trade and under that name has become as popular in those markets as under the name "Standard" in Canada. Now the name "Renfrew" has been adopted for Canada so as to link the name more closely with that of our company and so that we can sell the machine under a uniform name throughout the world.

BUILDING UP THE FARM WITH LIVE STOCK AND SOIL FERTILITY TO KEEP THEM.

For a good many years it has been our ambition to build our farm up. In pursuance of this policy, I have no doubt that we have sacrificed the opportunity to save as much money as we otherwise might; the tearing down process is often most lucrative for the time being; but we have had the satisfaction, and it has been a real pleasure to us, to see the soil steadily becoming better and better as the years have come and gone.

Our way of feeding fertility into the soil has been in the main through the stock. It was not long after we came to the farm before we came to understand that the use of barnyard manure is the most natural way of giving back to old mother earth what she so lavishly bestows upon us.

Our land was strong in the first place, but through lack of good management it had been permitted to run down. So we did not keep much stock in the first place although we did plan to feed all we could from the stuff grown on the place. It often happened that we had to buy some hay and grain to get through our long winters; but we did this, feeling that in the manure we got from our stock we had in some measure a return for the money laid out that way. First and foremost the good of the farm was in our minds.

It was our plan to manure some particular field each year as heavily as

AGRICULTURAL SOCIETIES AS A FACTOR IN GREATER PRODUCTION

(Continued from page 165)

Resolution re Gorund Limestone

"Whereas, clover is at the very "foundation of successful crop pro-"duction, and whereas, this crop is "exacting in its lime requirements "to such an extent that many of our "soils at present will not produce "profitable crops without being "limed, therefore, resolved that "the more general use of limestone "is advisable in order that clover, "which will enrich our soils in nitro-"gen from the air and potash from 'the subsoils, may be more success-"fully grown."

This, in concrete, was the result of a rally of Kings County Agriculturists under the auspices of the County Farmers' Association, held in January, 1917. You can quite readily see the additional benefits from such a meeting were these matters fully discussed by each Agricultural Society which would be the case were the delegates supposed to report back to their respective Societies.

At the Annual Meeting in December, 1917, a somewhat similar plan was followed and the subjects, after full discussion, were embodied in the following resolutions:—

First—"Whereas, the securing of "an ample seed supply of best qual-"ity, at the lowest possible rate, is "advisable in order to make possi-"ble the seeding of every available "area to crop, therefore, resolved, "that this Association recommend "a continuation of the policy adopt-"ed by the Provincial Department "of Agriculture regarding wheat "seed supply in this county in 1917, 'and further, that this policy be ex-"tended to cover oats as well."

Second—"Whereas, fertilizers are "essential if larger areas than form-"erly are to be put into crop, and "whereas owing to a scarcity of fer-"tilizers, it will be necessary to "place orders at once, therefore re-"solved that a committee be ap-"pointed to find out what supply is "available, the cost, and where it 'can be obtained."

Third — "Whereas transportation "is a big factor in obtaining neces-"sary fertilizer supplies, therefore, "we urge that fertilizers be placed "on the preferred list of freight "shipments."

Fourth—"Whereas much efficient "labour will not be available to meet 'the requirements on our farms, and "whereas we must at this time "make full use of the unskilled man, "boy and female help that can be "drawn from our towns and cities, "therefore, we urge that steps be "taken, to determine, at an early "date, what amount of this labour is "available and means devised where "by it can be efficiently mobolized "for work on the land."

Fifth—"Whereas, co-operation in "communities would make posible "the use of more improved machin-"ery at a minimum cost, and release "some efficient help thereby, there-"fore we adivse that groups of farm-"ers combine for the purpose of get-"ting gang three horse plows, seed-'ers, potato planters, potato spray-"ing outfits, etc., and thus make "possible the planting of larger "areas with the least possible help."

Sixth—"Whereas, District Repre-"sentatives, or County Agents are "utilized to great advantage through-"out the United States and in Ontar-"io in assisting farmers, through "bringing them personally into con-'tact with present requirements, "and outlining means best calculat-"ed to render their lands more pro-"ductive, and whereas a medium "such as this is necessary at present "facilitate the best distribution of "labour, thereofre, resolved that in 'our opinion steps should be taken 'to secure a district representative "for Kings County."

It is apparent that we must make use of less efficient labor than formerly, but rather then say we will not use such labor, it is a duty for us to devise means whereby it can be used. It is for our Agricultural Societies through their meetings, to encourage the use of such labor. It is for the Agricultural Societies to make more general the use of the double plow with three horses, thus doing the work of two teams and two men, with three horses and one man. Through a little organization,one such outfit could be kept steadily at plowing next spring, doing the drier areas first. The Ontario Footlift Gang with three good horses and a capable man would average 3 acres per day, and during the spring months over 100 acres of additional land could be put into crop by so combining, which under present conditions may not be possible. Possibly military horses could be secured and utilized during the spring months just for this purpose. The importance of arranging for the plowing of additional areas cannot be overestimated. As we all know, last fall was unfavorable for this work, and, unless additional provision is made for it, we cannot hope to overtake the work we should do.

Agricultural Societies can do more than any other organization in making effective the ideas as expressed above. They can determine the requirements of their district, after which steps can be taken whereby the requirements can be met most effectively.

I trust that what I have said may aid in increasing crop yields in 1918, for that is, or should be, the aim of us all at this time.

I would suggest that this Associatoin would advise that an Agricultural Rally be held in sach shire town in the Province, under the auspices of the County Associations, that delegates from each Agricultural Society be requested to attend this meeting; that the important matters of food production be discussed by the mast capable men available, and that these delegates report back to their Societies fully the matters brought up at these gatherings.

COMPARATIVE PROFIT IN THE CROPS ON A THREE YEAR ROTATION

(Experimental Forms Note)

The shorter a rotation the more labour required to work a given area and the greater should be the profit to the farmer. Three years is the shortest term in which a rotation, as generally understood, can be conducted. That is, after breaking sod only two crops are grown before hay is again the crop. The only method to follow in this rotation, if the soil is to be handled as to get the fullest benefit from its latent fertility, is to put a hoed crop of some kind on the turned down sod and by the rough cultivation during the growth of the crop, so pulverize it and impregnate it with air as to increase the solubility of the inert matter and oxidize the organic matter, thus preparing plant food and fitting the soil for not only the growing crop but those of succeeding years.

As an evidence of the extra profit to be obtained from the land under short rotation, the profits from the crops on a three-year rotation at the Experimental Station, Fredericton, N. B., may be quoted.

An old sod was ploughed in the early fall of 1913. It was harrowed and firmed down so that the sod made some progress towards decay that autumn . In the spring of 1914, the land was disced and harrowed alternately through May and until the 10th of June, when part of the land received a per acre aplication of 500 pounds of complete fertilizer of a 4-8-10 analysis and another part of an application of 1,000 pounds of the same fertilizer per acre. This was sown broadcast and harrowed in. Potatoes were planted in the drills 30 inches apart. The cost of the 500 pounds of fertilizer was $8.00 and a crop of 269.5 bushels of marketable potatoes and 22 bushels of small potatoes were raised, which that year had a market value of 50 cents per bushel for large and 20 cents per bushel for small, a total value of $134.15. The total cost of crop including fertilizer was $46.00, leaving a profit per acre of $88.15. On the portion of the field where 1.000 pounds of fertilizer was aplied the yield was 279¾ bushels per acre of marketable and 31½ bushels of small, a total crop value of $146.17, at a total cost of $54.18 leaving a profit per acre of $91.94.

In 1915, Banner oats were sown, seeded with 10 pounds Red clover and 4 pounds timothy seed per acre. The yield of oats was 52 1-3 bushels, valued at 60 cents per bushel, $31.40. The cost of raising was $10.96 per acre, a profit of $20.44. On the area where 1,000 pounds of fertilizer was applied, the yield was 45¼ bushels, affording a profit of $16.19.

In 11916 a good crop of clover grew where the 500 pounds of fertilizer was applied to the potato crop, and the yield was 2 tons 400 pounds which at $8.00 per ton was worth $17.60, cost of harvesting was $5.50. A small crop of clover seed was taken off the second growth of clover, amounting to 40 pounds which at 20 cents per pound made $8.00; the cost of harvesting and threshing was $4.00, this left a net profit from the clover crop of $16.00 per acre. On the area where 1,000 pounds of fertilizer was applied the yield of hay was 2 tons 1520 pounds and from this area the net profit per acre was, therefore, $19.18.

To recapitulate; the potato crop gave a profit with 500 pounds fertilizer of $$88.15, with 1,000 pounds fertilizer $91.94. The oat crop where 500 pounds fertilizer was applied to the potato crop, gave a profit of $20.44 per acre; where 1,000 pounds fertilizer was applied the profit was $16.19.

The clover crop where 500 pounds fertilizer was applied two years before, gave a profit of $16.10 per acre and where 1,000 pounds fertilizer was used a profit of $19.18.

CLEANING THE MILKING MACHINE

The pail can be kept clean in the same way that any milk pail is kept clean. Steam or scald it and dry it out thoroughly. Rubber parts cannot be kept clean in this way and they should be kept in a disinfectant solution. Various germicides have been tried out for the purpose and several of them are useful. Very few have been tried out thoroughly enough to justify recommending them. The one which the New York experiment station has found to be the most useful

CLEANER and BETTER FRUIT
Result from Spraying

If you have trouble in selling your apples or other fruit at good prices, because they have been shabby, wormy and distorted why not insure through spraying by using a

Spramotor
It isn't a SPRAMOTOR unless we made it

Thorough spraying will enable you (under normal conditions) to produce at least 75 No. 1 fruit and at the same time improve the condition of the trees.
The Spramotor has demonstrated its superiority in performance and build. There is a machine suited to your particular needs—hand or power. Prices from $7 to $400.

Made In Canada. No duty to pay.

We Keep the Quality Up

It is one thing to make flour that is occasionally good.
It is quite another thing to make flour that is ALWAYS good.

PURITY FLOUR

Never disappoints. Whether you buy one barrel or a hundred the quality is ALWAYS the same and makes

More Bread and Better Bread---and Better Pastry, too.

and which will give satisfaction if directions are followed is ordinary chloride of lime (bleaching powder) purchasable at any drug store.

Preparation of Disinfectant Solution

Do not buy more than one or two 12ounce cans of chloride of lime at any time and do not accept any in broken or rusted packages, or any that is moist. It should be a dry powder if it is fresh and of good strength. Prepare a stock solution by adding all of the powder in a can to a gallon of water in a pitcher or tall glass jar. This will give you a greenish colored liquid with a heavy, white sediment of lime.

Fill a second crock holding 20 to 30 gallons with water and add one pint of the stock solution to this twice a week. Double this puantity will do no harm. The solution in the big crock loses strength quickly on using, and in a few days will become useless if the new chlroide is not added.

It is advisable to add enough salt to the crock to make a strong brine, as this keeps the solution from freezin gin cold weather, and brine is of itself a good solution in which to keep the teat cups. The salt, however, is not necesary if attention is given to keeping up the strength of the chloride solution. This solution may be used indefinitely if its strength is maintained by adding fresh chloride of lime solution as directed.

Procedure for Cleaning

Immediately after each milking prepare three pails. Fill Pail 1 with clean cold water, Pail 2 with hot sal soda water, and Pail 3 with clean hot water. While the teat cups are still attached to the machine immerse them in these pails successively at the same time sucking the water through them. Then take the teat cups and stanchion hose and either suspend them or immerse them in the solution in the large crock.

Care should be taken when putting the tubes into the solution to make sure that the air bubbles are out of the tubes and that they are completely immersed. Neither rubber nor properly made metal parts are injured by the solution recommended.

Once a week the rubber teat cups should be taken apart completely and each part thoroughly cleaned. No disinfecting solution will take the place of cleaning.

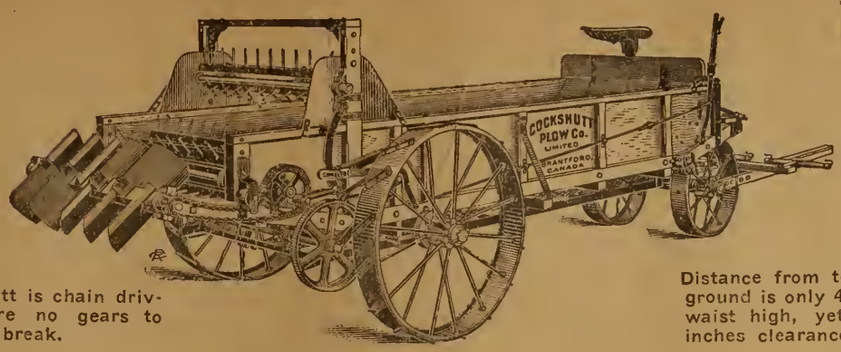
Care of the Teat Cups

Just before beginning to milk, suck a pail of clean water, either hot or cold, through all of the teat cups, otherwise traces of the disinfectant may be carried over into the milk. Even if this does happen an dtraces are carried over, harmless compounds are formed like some already present in the milk. The action is such that it would be necessary to add large quantities of the disinfectant if anyone should attempt to use it fraudulently as a preservative in milk. If this is done the milk has such an unpleasant odor and taste that it is unsalable. Chloride of lime is also a very valuable disinfectant for use in caring for unfiltered city water supplies and large quantities of it are used in this way.

A little granulated charcoal mixed in the soft food will generally check bowel trouble in chicks.

When the Indian Runner duck has reached a marketable age, she has nearly completed her growth, and has little left to do but complete her plumage and begin to lay.

Too much use of cayenne pepper has caused considerable trouble among poultry keepers and so has overfeeding. The former brings on liver troubles, and the latter leads first to indigestion, then fever, and gangrene of the intestines; or inflammation of the mucous membrane, which is cattarh or croup; or anthrax, whihc is black comb; and other fatal disorganizations of the muscular tisues of the liver.



The Cockshutt is chain driven—there are no gears to freeze up or break.

Distance from top of box to ground is only 41 inches, just waist high, yet there is 17 inches clearance underneath.

Cockshutt Manure Spreader

Barnyard fertilizer is more than ever important now when so much production is wanted and commercial fertilizer is so scarce. Hence you want a manure spreader—one that will have ample strength to stand up under years of hard service—yet won't be heavy on the horses—and one that will really "spread," not merely dump the manure in patches. In other words, you want a Cockshutt Manure Spreader.

Built of malleable iron and steel wherever possible to save weight and add strength. The drive is by chain—the strongest known. The bottom of the box is stationary, there are no slats, aprons or rollers to become fouled and broken; the carrier consists of heavy steel angles held together by chains,—simple and effective.

The distributing cylinders and paddles pulverize and spread the manure better than you could do it by hand. Easy lever at driver's hand throws mechanism in or out of gear. In two sizes, 50 or 65 bushels.

Special Cockshutt Manure Spreader booklet gladly sent on request

BUILDING UP THE FARM WITH LIVE STOCK AND SOIL FERTILLIZER TO KEEP THEM

(Continued from page 187)

we could and grow corn or potatoes on it. With some of the manure still locked up in the eatrh we ploughed that field the fall after the corn crop was taken off and the next spring we seeded it to oats, with clover and timothy as a cover crop.

We rarely failed to get a good crop of oats and usually a fine stand of clover and timothy. At first we did not have the manure we would have liked to use but since we had been keeping more cows, we have felt it good economy to give the new seeding a good top dressing, if possible in the fall or early winter. As a rule we have cut fine crops of hay from new meadows treated this way.

As we have learned that we ought not to leave fields handled this way too long in grass; by following a short crop rotation, we get ont a little fertility from the clover and timothy roots, while the grass aftermath itself adds considerable goodness to the soil One field underway, we take up another the following year and so on in successoin. In this way we have greatl increased the capacity of our farm for producing corn, oats and especially hay. In this last mentioned crop we have done particularly well. We are now cuting twice as much hay to the acre as we did in the beginning.

Each year we are growing more and more corn, not simply silage corn, but also flint corn to be ground or fed whole. To help about this we have put up a silo about fourteen across and thirty feet high. The ensilage is all fed in the barn, which has expanded two or three times its original size, and is now too small for the demands upon it. As suggested a moment ago, our herd of cows has increased five or six times over the first few kept. We have now thirty head, young and old, as against the three we had when we first came on the farm.

Of course I know that by selling off the crops grown on the place, we might have had more ready money. But we have thought it best to leave the head of the goose on the neck, believing that itis better worth while to make the soil of the farm richer rather than to gather in a few dollars more for the rainy day that may never come. We have seen some of our neighbors trying off the stock and depending on selling hay for their revenue and if followed very long this always has resulted in poor, run-down land and dilapidated buildings. That is the natural consequnce of such a policy.

We have learned that barnyard manure is not a complete form of soil fertility. It lacks some things that the land needs. Those elements have been extracted in the process of feeding. To make up for this we have for some time been using some form of commercial fertilizer. Not a agreat deal has been necessary with us. but we have gotten good results from a light dressing of lime or acid phosphate or both. This we have been able to get at a low figure, and by using some when we seed the land to oats as described above. we have been successful in correcting any acidity that might otherwise have been noticeable in th soil as the result of using manure and green stuff as our chief forms of fertilizer.

Not the least of our returns from this plan of making the farm better has been the satisfaction we have had in seeing the soil grow steadily in productiveness. How any man can be contented to feel that through the work of his own hands his farm has been growing poorer year after year so that when the time comes to lay down his work he wil have ony a wornout place to pass on to his children or to somebody else is more than I can understand. What finer legacy can any of us make to oncoming generations than a good, well kept farm? That is one way we may all help to make the world better.—E. L. VINCENT.

NOVA SCOTIA FARMERS ASSOCIATION DIRECTORS' REPORT FOR 1917

The 2nd report of the Directors' of this Association will not be an extended one as the subjects that would naturally appear in it wil be fully discussed during the Convention.

Nova Scotia as part of thsi great Dominion has been called upon to put further efforts out to help win the war, both with men and food; in both of these she has not fallen down, but more will be needed before final victory. The farmers of the Province must be prepared to do even more and under harder circumstances, the growing scarcity of feeds, fertilizers, seeds and labor. This Convention should most seriously consider these phases with a view to keeping up with and even increasing production.

We were to have met in the Capital of the Province, but as you know the terrible catastrophe that happened that city put that out of the question, so it was decided to meet here, the centre of our Agricultural Education.

The Exhibition Buildings and the grounds were within the devasted area and suffered badly. Probably the Exhibition will not be held again for two years, your representatives on that Commission can more fully inform you as to this.

The program for these meetings has been printed and distributed, the subjects found thereon will be open for full discusion, and others may be brought up, but your directors urgently ask that any resolutions members wish passed at this convention be put in writing and handed in early so that place can be found for their introduction and full discussion.

The financial standing of the Association is good, as can be seen by the following statement, which has been duly audited and found correct by your Auditors, Prof. Trueman and Mr. Landry.

W. H. HENRY
Snubenacadie - - - N. S.

Whitewash stains on white linen will disappear if soakked in vinegar.

When packing bottles rubber bands slipped over them will prevent breakage.

Add a little drop of salad oil to mustard when it is being made. Not only will it improve the taste but iit will keep fresh for days.

In peeling onions place them so that water covers the onion, to prevent the eyes from smarting.

STRAWBERRY PLANTS!

We again offer to the strawberry growers of the Maritime Provinces a wide range in varieties of well grown, true to name strawberry plants. We have Senator Dunlaps, Glen Mary, Haverland, Bubach, Buster, Sample, Arnout, Wm. Belt, Warfield Williams, Dr. Burrell, Early Jersey Giant, Kellogg's Prize, Kellogg's Premier, Portia, Progressive and Frances.

Write for our free Catalogue with description of varieties and price list.

CYRUS & MANNING ELLS
Port Williams - - Nova Scotia

FOR SALE!

We have for sale a breedy, growthy bunch of young Shorthorn bulls, different ages, most of them are bred very strongly along milking lines, yet they would be a credit to any beef herd.
would be a credit to any beef herd.

We are booking orders for spring delivery of our large English Berkshire young pigs. Not the short chubby type, but the lengthy, growthy and large.

L. M. ANDERSON, Sackville, N. B.

THE BEST VARIETIES OF VEGETABLES

(Experimental Farms Note)

Owing to the scarcity of seed of many varieties of vegetables this year it will not always be possible to get those which are desired, hence the importance of ordering early in order to make sure of getting at least some of the best sorts. In the following list based on tests made at the experimental farms and stations in Canada, several variieties of almost equal merit of some kinds of vegetables are suggested so that if it is not possible to get one it may be possible to get the other.

Beans.—(Round Pod Wax) Round Pod Kidney Wax, Pencil Rod and Brittle Wax; (Flat Pod Wax), Wardwell Kidney Wax, early, and Hodson Wax, late; (Green Pod), Stringless Green Pod, and Early Red Valentine, early, and Refuge or 1000 to 1, late. Lima and Pole beans ar enot very satisfactory except where the season is long and warm. The bush varieties of Lima are the most satisfactory. Scarlet Runner is the most reliable Pole bean but Kentucky Wonder is one of the best in uqality.

Beets—Crosby Egyptian, Detroit Dark Red, and Early Model.

Borecole or Kale—Dwarf Green Curled Scotch.

Brussels Sprouts.—Improved Dwarf. The Dwarf varieties have been found more satisfactory than the tall ones.

Cabbage—Early Jersey Wekefield, Copehagen Market, early; Succession, medium; and Daniish Ballhead and Drumhead Savoy, late; and Red Dutch red.

Cauliflower—Early Snowball and Early Dwarf Erfurt.

Carrot—Chantenay, Danvers Half Long, Early Scarlet Horn for extra early.

Celery — Golden Self Blanching (Paris Golden Yellow) early; Winter Queen, Evans Triumph, and Perfection Heartwell, late; White Plume for coolest parts.

Corn—(Extra early), Early Malcolm Malakoff and Peep O'Day; (early), Golden Bantam; (medium), Early Evergreen or Black Mexican; (late), Country Gentleman and Stowells Evergreen; Squaw for coolest parts.

Cucumber—Davis Perfect, White Spine, and Chicago Pickling.

Egg Plant—New York Improved, Long Purple, and Black Beauty.

Lettuce—Grand Rapids and Black Seeded Simpson (early loose curled), Iceburg, Giant Crystal Head, Improved Hanson, Salamander, All Heart, and Crisp as Ice (head or cabbage).

Melons — Musk. (Nutmeg type), Long Island Beauty, Hackensack and Montreal Market; (yellow fleshed) Emerald Gem, Hoodoo and Paul Rose.

Melons—Water. Cole Early, Ice Cream, and Phinney Early.

Onions—Yellow Globe Danvers and Early Red Wethersfield. Prize Taker especially for transplanting. Early Flat Red and Australian Brown are good where the season i short. Dutch sets ensure a crop in a short season when, if grown from seed, the onions may not mature.

Parsley.—Double Curled.

Parsnip—Hollow Crown of a good strain is the best. Intermediate is also good.

Pepper—Early Neopolitan of the large varieties and Cayenne, Chili and Cardinal of the small ones.

Peas—(Extra early) Gregory Surprise; (early) Thos. Laxton, Gradus, Nott Excelsior, American Wonder, and Sutton Early Giant; (second early) Sutton Excelsior and Premium Gem; (medium to late) McLean Advancer, Heroine and Stratagem; (tall late sorts) Telephone, Champion of England and Quite Content.

Radihs—Scarlet White Tipped Turnip, Rosy Gem, and White Icicle.

Salsify—Long Whiite, Sandwich Islands.

Spinach—Victoria, Thickleaved, Viroflayed.

Squash—Long White Bush, Summer Crookneck; late, Delicious, Hubbard.

Tomatoes—(Extra early) Alacrity, Sparks Earliana; (early and main crop) Bonny Best, Chalks Early Jewel. Later good sorts are Matchless and Trophy (scarlet), and Livingstone Globe and Plentiful (purplish pink). Ignotum for canning.

Swede Turnips—Champion Purple Top.

Potatoes—(Early) Irish Cobbler or Eureka Extra Eearly; (main crop) Green Mountain, Gold Coin, Wee MacGregor, Carman No. 1. Early Ohio is a good extra early pink sort but is not very productive.

POTATO SPRAYING DEMONSTRATIONS IN 1917 AT THE CHARLOTTETOWN EXPERIMENTAL STATION

During the early summer of 1917, several makes of potato spraying machines were secured for experiments at the Charlottetown Experimental Station. A contest was arranged, and the dates on which the several sprayings would be applied were advertised in the local papers. A number of interested men attended practically every demonstration. On the 2t8h of August, 1,300 people visited the Station, and the majority went to the potato field to see the work of of the different machines. Late blight occurred in many parts of the Province early in the season, and the check plots that were not sprayed at this Station showed very plainly htat quite a bad attack of the disease was present.

The contest was carired on in duplicate with Green Mountain potatoes. Four applications were made to each plot. The total cost of applying the bluestone and lime includes the cost of both man and horse labour. Unsprayed check rows were left at intervals throughout the field for purposes of comparison. Long before potato digging time, anyone could pick out these by their dead, diisease-infected tops. The following results were obtained:

(1) A four-row, horse-power machine with one nozzle spraying down from the top and one on either side of the row, applied 80 gallons of 4-4-40 Bordeaux to the acre, at a cost of $1.65 per application without poison. The plots yielded at the rate of 194 bushels of marketable potatoes, or 52 bushels more marketable potatoes thaan the corresponding unsprayed check, giving a net gain over the total cost of spraying of $32.40 per acre.

(2) A four-row horse-power machine with one nozzle spraying down on the foilage of each row, applied 35 gallons of the same Bordeaux per acre, at a cost of 80c per application. These plots yielded at the rate of 166 bushels of marketable potatoes, or 24 bushels more of saleable potatoes than the corresponding check, giving a net gain over the cost of spraying of $14.80 per acre.

(3) A four-row hand machine with one nozzle spraying down, and one nozzle spraying through from the side applied 40 gallons of the same Bordeaux at a cost of $1.00 per application, per acre. These plots yielded at the rate of 171 bushels of marketable potatoes, or 51 bushels more saleable potatoes than the corresponding check giving a net gain, after deducting the total cost of spraying, of $35.00 per acre.

(4) A four-row hand machine with one nozzle spraying down on each row applied 26 gallons of the same Bordeaux at a cost of 70c per application. These plots yeilded at the rate of 138 bushels of marketable potatoes, or 19 bushels more saleable potaotoes than the corresponding check, giving a net gain after deducting the total cost of spraying, of $11.45 per acre. Marketable potatoes were valued at 75c per bushel. The above contest clearly demonstratees the advantage of thorough spraying, and the necessity of spraying the 1918 crop.

CARE OF MILK CANS

Milk cans are necessary in shipping milk and cream, and such cans are all tinned. This protective coating of the steel plate is necessary to make the cans rust-proof, smooth and easily cleaned—an essential feature if milk is to be delivered in wholesome condition.

The supply of tin is so short that new cans are almost unobtainable, the recent recommended practice of retinning is uncertain of continuance, and even solder for repair work is hard to get. Therefore, all cans should be handled with the greatest care so that they may be kept in service for the maximum period of safe use; and all idle usable cans should be utilized.

WHY build with inflammable wood when you can get fireproof, weather-proof and lightning proof "Metallic" building materials. They are far cheaper in the end. "Empire" Corrugated Iron Siding is easily and quickly laid and makes a strong, rigid wall. Its light weight makes heavy construction unnecessary.

"Eastlake" Galvanized Shingles, coupled with "Halitus" Ventilators and "Acheson" Roof Lights make a perfect roof. "Metallic" building materials defy the elements. "Eastlake" roofs laid over thirty years ago are good to-day.

"Metallic built" means fireproof, stormproof, neat and durable construction.

Before buying any building materials write us for Booklet and complete information. We can save you money.

Metallic Roofing Co., Limited

VICTORY BONDS

"The National Investment"

VICTORY Bonds have so many attractive features they may properly be called the National Investment.

The assets behind Victory Bonds comprise every inch of territory, every farm and forest, every lake, railway, factory; in fact EVERYTHING in Canada is pledged for the payment of interest and principal of Victory Bonds.

Victory Bonds are issued in denominations of $50, $100, $500, and $1,000, which places them within the reach of everybody. There are three issues to choose from, maturing in 5, 10, and 20 years respectively. The investment will yield you 5¾%. Interest is paid you twice yearly, on June 1st and December 1st. They can readily be turned into cash should the necessity arise.

Unquestionably Victory Bonds are the best investment right now for everybody. Their value will increase considerably at the first definite signs of peace.

If there is any information you would like to have about Victory Bonds or any other security, write to-day to the Secretary of the Montreal Stock Exchange.

The form below is provided for your convenience. Fill it in NOW. It will bring you valuable information on Investing that you should have.

MONTREAL STOCK EXCHANGE

To the Secretary of the Montreal Stock Exchange,
Room 528, Stock Exchange Building, Montreal.
Without obligation, please send me your Book on Investing, also information regarding the market for Victory Bonds.

A SIGNIFICANT ANNOUNCEMENT

The announcement that letters patent have been granted The Empire Cream Separator Company of Canada. Limited, increasing their authorized capital from $300,000 to $1,000,000 is significant both of the remarkable strides made by this company within recent years and of the growing demand for the class of product which they manufacture.

The war has played ducks and drakes with pre-war theories and methods. It has been instrumental in establishing new standards of morals, of which not the least has had to do with economy and thrift. It has necessitated the use of every scientific short cut known, previous to its outbreak, and has forced the blazing of countless new ones.

In no department of applied science has this been more true than in that which has to do with labor saving devices. The constant drain upon the man power of the various nations engaged, has hastened the development and spread the use of countless mechanical substitutes for human effort, while rolling away the clouds of prejudice which had previously hindered their general adoption.

Among these the milking machine may be said to occupy a prominent place. Milking machines have taken the place of thousands who are today fighting in the trenches of Europe. They are obtaining more milk, cleaner milk, with less injury to the cows, than if these dairymen-soldiers had remained at home.

The Empire Cream Separator Company are the manufacturers of the Empire Milking Machine, which has met with phenomenal success throughout the Dominion. This is the machine which milks the champion four year old, Fancher Fram Maxie, and which has been installed as permanent equipment at MacDonald College and the Nova Scotia College of Agriculture at Truro.

The Empire Milking Machine is now a purely Canadian product. This fact added to the announcement of the proposed increase in the capital of the Company and the growing demand for milking machine equipment constitute one of the most interesting series of developments, from the standpoint of the Canadian agriculturist, that the war has produced to date.

TO PREVENT COW KICKING

Subscriber, Clover Bar, Alta., writes: "In your issue of Nov. 22 there is an article on "Breaking in the Heifers," which refers to the tying of a kicking heifer's feet. This should never be done, as there is a very simple method of taming either an ugly tempered or a nervous heifer or cow. Never since we have used this method have we had occasion to tie a cow's feet. We use a piece of clothes line doubled; put it around the cow in front of the udder and cinched up fairly tight. She may try to kick once but she never does again."

DANGER OF GASOLINE IN GARAGES

The increasing use of the automobile has caused many out-buildings to be converted into garages. This conversion, in many cases, carries with it the storage of more or less gasoline. This storage is highly dangerous, and constitutes a risk, not only to the garage itself, but to adjoining property. Gasoline will give off 130 times its bulk in vapor, and ,when vaporised, will convert 1,560 times its volume of air into an explosive mixture, which will ignite from a blaze or spark. Five gallons of gasoline will generate 8,000 cubic feet of gas, or enough to fill a room 20 by 40 feet and 10 feet high. When ignited, it immediately expands to 4,000 times that space. Gasoline should be stored in underground tanks if possible. It should not be kept in drums in the garage where it is a menace to life and property.

Handling the Flock During Lambing Period

By Prof. C. W. Coffey, Professor of Sheep Husbandry, Urbania, Ill. College of Agriculture

This following article is intended primarily for boys and girls in lamb clubs and for those who have not had experience with sheep during lambing time. It may, however, contain a few suggestions which experienced sheepmen can use to advantage. Many handle their flocks successfully without providing themselves with all the equipment and supplies listed herein, but everything mentioned has been successfully employed in saving eiither lambs or their mothers. It is also true that many sheepmen carry their flocks through the lambing period and experience few if any of the ewe and lamb troubles discussed in this connection; the fact that the troubles are discussed should not discourage anyone who is thinking of raising sheep.

In Preparing for Lambing

(a) Plan the farm work so that the shepherd can keep a close watch over the flock both day and night.

(b) Keep the ewes that are about due to lamb away from the other kinds of live stock. Large animals may injure them; hogs greedily devour young lambs.

(c) In cold weather provide warm quarters, well bedded and exposed to the sun, but do not overlook ventilation. Give the ewes plenty of room (12 to16 square feet each, unless closer crowding is necessary in order to keep the quarters warm.) Close all openings through which young lambs might creep and wander away.

(d) Have a few portable lambing pens, 4 x 4 feet or 4 feet x 6 feet. (Such a pen is the best place for a ewe and her lamb until the lamb is two or three days old.)

(e) Certain supplies should be on hand, such as:

1. Liquid sheep dip to be used as a disinfectant.
2. Epsom salts, castor oil, and raw linseed oil to be used as physic.
3. Tincture of iron, gentian and ginger to be used as a tonic.
4. Soap to place in water intended for injections to relieve constipation.
5. Tincture of iodine to be used on swollen udders an on navel cords to prevent "navel ill."
6. Swan-bill nipples for feeding milk to young lambs.
7. A metal syringe provided with a large nozzzle and also a small one suitable for giving injections to young lambs.
8. A glass graduate for measuring doses of medicine.

Caring for the Ewe

During the last few days before lambing, pen the ewe at night where it is intended she shall be until the lamb is a few days old. Avoid crowding and jamming in doorways and around feed racks. Give good, clean, palatable feed, consistinig mainly of roughage.

When the ewe is giving birth to the lamb do not disturb her so long as everything seems to be going well. If she must have help (which she should have if little or no progress is being made after much laboring), the first thing to do is to learn what position the lamb is in. To be delivered alive, it should be presented fore feet first, with the nose lying snug on the fore feet (this is the normal position for birth), or it may be delivered hind legs first. Before entering the ewe to get the lamb into the proper position, the hand should be disinfected and smeared with vaseline or oil. Care should be used not to tear the parts of the ewe, and it may be inadvisable for a person with a large hand to attempt the operation. Pull steadily on the lamb slightly downward toward the ewe's udder and use most strength in pulling when the ewe labors. Be sure to keep the head coming with the fore feet until the nose is exposed.

After the lamb is born give the ewe close attention for several days. Note whether she casts the placenta (afterbirth) and whether her bowels are normal. Watch her udder. Milk her if the lamb does not take all of the milk. Do not expose her to cold drafts. Give her all the water she wants but not large quantities at one time and it should not be ice cold. Give her good feed, ,such as clover hay and oats; allow grain sparingly for two or three days after the lamb is born, unless she is in thin condition.

After the lamb is a week old the ewe must have plenty of feed until there is an abundance of grass; and abrupt changes in her ration should be avoided.

Do not worry if the ewe refuses to eat for the first three to six hours after lambing, but if she continues to refuse feed, make sure that her bowels are in good condition. Four ounces (one-third pint) of raw linseed oil, or 4 or 5 ounces of Epsom salts dissolved in water, is a good physic. For a very quick acting physic, 2 ounces (4 tablespoonfuls) of raw linseed oil with 4 ounces of Epsom salts may be used. To aid the appetite, give three times daily a teaspoon each of tincture of gentian and giniger in one-half pint of luke-warm water. If the ewe is in thin iflesh, add a teaspoonful of the tincture of iron to each dose.

A ewe lacerated inwardly or failing to fully cast the after-birth after lambing, should be washed out daily with injections of boiled water that has been allowed to cool, ,or with a liquid dip diluted 1 part to 100 parts of water.

When the ewe's udder is swollen keep it milked out and paint it twice a day with tinsture of iodine until the swelling begins to go down,, and there after paint it once a day until it is evident that further treatment is unnecessary. If pus forms, make an opening for drainage and wash the affected part once a day with a good disinfectant. Ewes with swollen udders should be removed to comfortable quarters outside the sheep barn, for their trouble may be caused by an affection that will spread through the flock. Since their milk is often poisonous their lambs should be taken away from them and fed by hand until the swelling subsides. Be sure not to let the lambs unrse from other ewes, for this may spread the disease.

Sore teats in ewes are most often caused by the formation of poc-like sores, but sometimes by the long, sharp teeth of the lamb. The first symptom of the poc sore is a whitish pimple or blister. As soon as the sores are discovered, they should be opened and washed twice a day with a solution of sheep dip, one part to twenty-five parts of water. If the lamb's teeth make the teats sore, about the only thing to do is to take the lamb away from the ewe. When the teats are very sore the ewe refuses to let the lamb nurse; hence the shepherd should see to it that she is kept milked out.

Caring for the Lamb

When the lamb is born place it and the ewe in a pen measuring 4 feet x 4 feet, or 4 feet x 6 feea. Little attention need be given the strong lamb whose mother has milk, except to see that it finds the teat. If its mother has no milk, it is best at first to take a little from an ewe that has more than enough for her lamb. The next best thing to do is to feed whole cow's milk, using about two tablespoons every two or three hours. The milk should be heated about 90°F. in a bottle placed in warm water. In order t ogive the milk at proper temperature, the bottle and the water should be in a pail which can be taken to the place where the lamb is to be fed.

A lamb too weak to stand to nurse should get a fill of its mother's milk as soon as possible. If it is anxious to nurse back the ewe into a corner and hold the lamb to the teat and increase its anxiiety to feed by patting it on the rump. If it refues to nurse, draw some milk rfom the ewe and feed the lamb from a bottle until it gains strength and develops a strong appetite.

One of the best ways to handle a chilled lamb is to place all but its head in as warm water as the elbow can bear. As the water cools put in more warm water to keep up the temperature. When the lamb becomes somewhat lively, take it out of the bath, and rub it briskly with a coarse cloth until it is almost dry. Then feed it, wrap all but its nose in a thick blanket or cloth, anad place it in a warm place to sleep. Keep it away from its mother no longer than absolutely necessary. Always wrap a lamb in a cloth when placing it in artifically heated quarters.

When the ewe disowns her lamb try to get her to claim it. A ewe recognizes her lamb at first wholly by smell. This being the case, it may help to smear on her nose and on the rump of the disowned lamb some milk drawn from the ewe. Another procedure is to tie the ewe in a small pen where it is easy to hold her and force her to let the lamb nurse often and being tied, it is difficult for her to get away from it. When the disowned lamb is one o a pair of twins, both lambs sould be placed in a pen next that occupied by the ewe so that she cana see them, and both should always be put with her at the same time. In her anxiety to nurse the lamb she claims, she is likely to let the other one nurse also.

If a ewe with a good suppiy of milk is left without a lamb, an attempt should be made to have her raise one, an orphan or one not getting enough milk from its mother. If she has just lost a lamb, it is usually easy to get her to take another by immediately removing the skin of the dead lamb and placing it on the stranger intended for her. If this proceeding is not possible for suggestions given above for getting a ewe to claim her own lamb may be employed.

Common Ailments and Diseases of Young Lambs

"Pinning" is a collection of sticky dung clinging to the wool around the anus. It should be scraped away with a stick or corn cob.

Constipation is indicated by straining and distress in the attempt to pass feces, or dung. Injections of lukewarm soapy water should be given, and it will help if a tablespoon of castor oil o rmilk of magnesia (hydroxid of magnesia) is given.

White Scours in lambs are caused by digestive disorders which usually result from mistakes in feeding the ewe, and hence are to be avoided largely by giving the ewe clean wholesome feed and not changing the ration abruptly. A lamb having white scours should be taken away from the ewe and allowed only a little of the milk. This can best be accomplished by milking the ewe out before letting the lamb nurse. Milk of magnesia given as suggested for constipation will help correct the disorder.

Beekeeping and Honey Production in N.B.

Opportunities for Development of the Industry

By L. T. Floyd, Provincial Apiarist, N. B.

Honey as a Food

Honey is one of nature's best foods. It is only within the last few centuries that sugar has become known, and only within the last generation that refined sugars have become so low in price that they may be comonly used in the poorest families. Formerly honey was the principal sweet, and it was highly valued three thousand years before the firs tsugar refinery was built.

It would add greatly to the health of the present generation if honey could be at least partially restored to its former place as a comon article of diet. The almost universal craving for sweets of some kind shows a real need of the system in that direction; but this excessive use of sugar brings in its train a long list of ills. When cane sugar is taken inito the stomach it canot be assimilated until first changed by digestion into grape sugar. Only too often the overtaxed stomach fails to properly perform this digestion, then comes sour stomach and various dyspeptis phases.

In honey we have a sweet that needs no further digestion, as it has been prepared fully by the bees, for prompt assimilation without taxing stomach or kidneys. As Prof. Cook says: "There can be no doubt but that in eating honey our digestive machinery is saved work that it would have to perform if we ate cane sugar; and in case it is overworked and feeble this may be just the respite that will save from brekdown." A. I. Root says: "Many people who canont eat sugar without having unpleasant symptoms follow will find by careful test that they can eat good well-ripened honey without any difficulty at all."

Not only is honey the most wholesome of all sweets, but it is the most delicious, and its cost so moderate that it might well find a place on the tables of the common people every day in the week. Indeed, in many cases it would be a matter of economy to lessen the butter bill by letting honey, in part, take its place. One pound of honey will go as far as a puond of butter; and if both articles be of the best quality the honey will cost only half as much.

Bees Essential to Fruit Growers

Scientists tell us that insects were created for the purpose of carrying the pollen from flower to flower. Some flowers are sterile to their own pollen as in some variieties of strawberries. It is a well known fact that if we plant such varieties as the Sample or Haverland by themeslves we need not expect a crop. While this is shown very plainly in the strawberry it is observed to a more or less marked degree in all fruit blossoms. Darwin summed up this subject by saying "Nature abhors perpetual self-fertilization."

Improper pollenation results in a failure of fruit to set or in its dropping before ripening. This has been proved in extensive experiments. By covering numbers of blosoms with cheese cloth to keep out all insects it was found that the blossoms so covered produced no fruit. It has been asserted by those who have made a careful study of the subject that the owrk done by bees in pollen distribution is worth more to humaniity than the rcop of honey produced. It has been noted that fruit growers who keep bees have better crops in the so called off years and a higher average yield than orchards situated where bees are scarce.

Opportunities for Honey Production

Honey is a product that goes to waste in most localities and in these times of food scarcity we may be of service by providing bees to harvest this valuable food product. Every pound of honey produced will release its equivalent of butter or sugar ofr food purposes.

The present crisis int owhich our ation has been forced may be a supreme test of the usefulness of our industry, tor should our supply of sugar be suddenly cut off we might be compelled to depend on honey as our only source of sweetness. It is claimed that the United States only produces 20% of her sugar requirments and Canada much less. If this is correct and our loss in shipping continues it would not take much of a prophet to tell us that the time when we part company with the sugar bowl is fast approaching.

Every beekeeper worthy of the name knows that in his locality a ton or tons of honey go to waste in an ordinary season. It is not worth while to make a determined effort to secure what we can and place it on the market. Our beekeepers have never had better opportunities than the present ones.

In past years the bulk of honey in our larger markets was imported from other provinces. The large increase in the price has changed thi scondition. When the price of honey lingered around the 10 cent mark, wholesalers bought large quantities and shipped them to New Brunswick to be bottled and distributed to the grocery and drug trade. But now, with honey selling at 18 or 20 cetns per pound, there is not much danger of large importations being made.

If we can increase our production to supply the local trade that now exists we will then be able to build up a larger trade on that foundation. A prominent beekeeper in Guelph told me recently that when he started beekeeping ten or more years ago, he could not sell his crop of seven hundred pounds in that city, but by selling good honey, properly packed, his scity trade had grown to 18 tons, which amount he had sold last season, and he claimed he held no monopoly on the trade. That shows what can be done in the way of building up a market.

Those who begin beekeeping now start under decidedly different conditions than those who began twenty years ago. No branch of farm work has advanced with such strides as the beekeeping industry. Each year has ushered in new inventions in the line of machinery to help handle the crop and with the advent of power extractors, steam uncapping knives and other improved equipment, large quantities of honey can be handled much easier than in the old way.

Wintering

Our beekeeping industry might be likened to tripod or three legge stool. Should any leg fail the structure falls. These legs we term wintering, swarming and disease. Quite a number fail in wintering and by wintering I do not mean simply living through the winter. Colonnes may live through the winter and come out in numbers so weak that they may be of little use when th ehoney flow comes.

Successful wintring means having hives well filled with bees when they come from the cellar or packing case. The larger the cluster the more heat they can generate and the better they are able to resist the rigors of the spring weather with its cold nights. Strong colonies will increase rapidly at this time, while hives having but a handful or two of bees will, either only be able to hold their own or will sometimes die outright.

A cellar where the temperature remains fairly, between 40 to 45 degrees gand the atmosphere is fairly dry, is a good place to winter bees, but cold damp cellars are not good.

Bees have been wintered out doors successfully in several places througout the province, both in single cases and with four hives in a case packed with planer shavings or other insulating material, so no one need hesitate about starting in beekeeping because of the lack of a suitable cellar to winter them in. In out door wintering it is best to have packed cases in a sheltered location; a windswept place is not good.

Swarming

Bees may come from the cellar after wintering perfectly and still give a poor crop, because of swarming. Nature planned that bees should increase by swarming, but nature is satisfied if the bees gathre sufficient honey to winter them. We plan to get large quantities of honey by offsetting nature's plans. But when we work against nature twe must be perfectly familiar with those plans, therefore, to be successful in the control of swarming we must know why bees swarm and what treatment to give to prevent them doing so. This can only be accomplished by opening the hive each week and noting the condition. When we do this we soon become familiar with each move made by the bees and can then give treatment that wil lcontrol the swarming impulse to such an exten that we can afford to lose the few swarms we hvae, rather than be always watching for them.

We can give no treatment that will effectively control swarming in box hives. By box hives I mean any hive that is so constructed that it is necessary to kill the bees to get the honey. Most box hives are built so that they receive little or no ventilation, and because of lack of ventilation aod the small size of the brood chamber, the bees swarm. We do not need to allow bees to swarm for the sake of increase. This can be made artifically much easier than we can climb trees to gather in stray swarms.

Disease and Inspection

I believe tha twe have very little disease in the province. A few cases have been discovered. Some of these were treated successfily and others have been neglected but we hope to

THE NOVA SCOTIA FARMERS' ASSOCIATION AT TRURO—JANUARY, 1918.

have these treated next season.

Little can be accomplished by an inspector if he cannot have the earnest co-operation of the beekeepers themselves, as there is little use in enforcing the disease law if the beekeepers are not careful about the matteh themselves. But much can be done in the way of preventing the spread of foul brood, if the inspector and beekeeper work hand in hand. While we have so many bees in boxes it is a difficult matter to make complete inspectio n of all colonies. One of the most difficult problems that other provinces have had to deal with is the disease question. We plan to pay particular attention to this matter during the coming season.

Grading and Marketing

We should aim to manage our apiary work so that we can place on the market a fairly uniform grade of honey. Then, when a dealer asks for 10 gallons of Light or Dark Honey he can be reasonably sure of getting it. We will then be in a position to cater to a trade with unlimited possibilities.

We have only a few beekeepers who can furnish honey that will fulfill these requirements, yet ni St. John City alone we have close to a hundred dealers that could handle good honey. Most of these dealers never get a chance to sell honey because it is not available.

Aid to Beekeepers

Hitherto, beekeeping in New Brunswick has not received the attention and encouragement that its opportunities deserved, but the Department of Agriculture, by the appointment of a Provincia lApiarist, plans to remedy that state of affairs as much as possible. Demonstration meetings will be held in localities where there are a number of beekeeprs and as many viits to individual apiariis will be made as possible. The great bulk of Mr. Floyd's time will be spent in these demonstrations and, more especially, in personal visits to beekeepers, as this plan of work is productive of thebest results. Address all letters and enquiries relative to beekeeping problems, demonstrations, and viisits to L. T. Floyd, Provincial Apiarist, Department of Agriculture, Fredericton, N. B.

INCREASED PRODUCTION; CAPITAL'S OPPORTUNITY

To the Editor of the Maritime Farmer:

Sir,—As your readers are well aware, the call has gone out for "Increased Production" in the different provinces and particularly for wheat and pork.

The comittee in charge of this has been working hand in hand with the Department of Agriculture and the Committee on Food Conservation under Dr. W. C. Keirstead in this province and, so far as we can do so, matters have been arranged, for th epresent, for a vastly increased production of wheat, which in turn will, we hope, lead to some food for the increased pork production.

The department has purchased, or is under contract for the following seed:
10.00 bushels of Marquis wheat.
6.598 bushels of Red Fife.
1.200 bushels of White Fife.
50.000 bushels of oats.
1,500 tons of fertilizer with potash, 3-6-5.

This grain iis all beinig held available for delivery to the farmers through their County Councillor and will be sold as near cost as will be deemed practicable. The fertilizer is availiable at cost whenever farmers club their orders so that deliveries may be made in at least 25-ton lots.

This should provide for a considerable increase and from the experience that feeders of live stock are having this winter and may have before spring, it would seem absolutely necessary that during the coming season as large an acreage as possible be given to the raising of wheat, where the land is suitable for it, and that arangements be made for the cultivation of as much wheat land as possible for next season, in order that there may be some feed available for our own live stock, because it is estimated that Candad is at the present time milling only some 84 carloads per day of feed, and that much is expected to be distributed throughout Canada from the Atlantic to he Pacific, and as the Atlantic is some distance from the heart of the mills, naturally, the nearer centres to the mills are apt to get the feed first and now that it is not absolutely essential that the millers load flour in order to ship feed, that is so far as the miller is concerned, yet it takes so long to make up a carload of feed only at the mills that it means a considerable delay if one tries to purchase feeds entirely by themselves.

It is expected that before the Fall arangements will be made by the department so that the milling of this wheat will be taken care of. In any event there is a sure market for the crop or in the whole grain itself, as it is the whole grain more than flour that is wanted for export.

Now, having gone this far, the next step is to realize row difficult it is going to be for our farmers in this province who are not, as a rule, overburdened with capital, nor have they in the past been able to make profit enough to enable them to pay anywhere near the current rate of wages that labor demands, and the ydepend on their own boys to stay at home and help in this production, though in many cases they are unable to keep them on the farm, owing totheir being unable to pay them equal to other trades.

The majority of the farmers have in the past been working very long hours, in order to reach their ordinary production and when seeding time comes around, almost all their available horses are pushed to the utmost. Consequently, it iis going to be hard to expect so very much more from them, unless the Capitalist steps in to assist.

The most practicable way for this to be accomplished, in my opinion, would be for the merchant or manufacturer, who, in many cases, has been making good profits from war conditions, to use some of this profit get next to some farmer of good reputation, whom he himself would know and offer to finance him for whatever wheat acreage he would put in, making an agreement with the farmer that he would be reimbursed from the profits of the wheat crop. It might be that there would not be much profit made, consequently it is only fair that the man with the money should take the chance with the farmer.

Many people do not realize what the farmer is up against in the way of weather, land conditions, etc., and especially iis this so with those who do business with a roof over their heads, turning over stock and manufactured goods.

If the man, who is asked to grow the wheat, can be assisted by the capitalist taking a chance with him, I feel quite sure that greater results would be produced.

The crop will, unquestionably, be wanted an dthe price should not permit of very much loss, but ought to bring in some litle profit, provided of course, the elements give us a fair chance.

It looks at the moment as though some arrangement might be made, whereby some of those who have been called to Military Service, but who are uesd to working on the land, may be available, though of course, they will have to be paid a corresponding rate of wages.

The farmer in most cases cannot afford very much hired help, especially for such an uncertain crop as wheat will be in this province; so it is up to the moneyed man to help in this production, in any and every way possible.

I am quiiet sure that many of our smaller farmers wil lattempt a greater wheat acreage if they see th ecapital availiable for the hiring of labor and horse power or tractor.

I trust that our merchants and manufacturers, hwo have the capital, will see that they help in this direction for it would most certainly seem that we must get the wheat in some way.

E. A. SCHOFIELD,
Chairman of the Provincial Increased Production Committee.

THE COST OF GROWING POTATOES IN NEW BRUNSWICK UNDER 1917 CONDITIONS

On account of the various investigation conducted by the Food Controller into the costs of production of various crops and the controversy arising especially in regard to potato growing, it may be of interest at the present time to give an actual statement of the cost of growing this crop at the Experimental Station, Fredericton, N. B.

In approaching this question it might be stated that on account of the larger estimate of the cost of production in New Brunswick as compared with other provinces, that doubt has been expressed in some quarters as to the genuineness of the figures submitted by some New Brunswicik growers.

The Experimental Station is in a position to help in dispelling these doubts by giving an official statement of cost actually incurred on one acre of potatoes especially set apart for this purpose. At the same time these figures may serve to call attention of growers to the desirability of keeping a businesslike account with their own individual field operations.

The conditions under whicch potato growing last year necessitated higher expenditure than ever before. Labour, fertilizers and spraying materials were much more costly than in previous years, while the price of seed was higher than ever before known in the history of the country.

As a comparison of cost and illustrative of its increase in 1917 it may be stated that based on the same details as given for the season of 1917, an acre grown in 1915 cost $73.98, the crop was 80 barrels of marketable worth $1.75 and 7 barrels culls worth 50 cents; a total value of $143.50 leaving a profit per acre of $69.52. A cost per barrel of 85 cents and a profit per barel of 80 cents.

In 1916, the acre cost $88.09, the crop was 120 barrels marketable worth $2.75 per barrel and 6 barrels culls, worth 50 cents a total value of $330.00, leaving a profit of $244.91. A cost per barrel of 70 cents and a profit per barrel of $1.94.

In 1917, the following are thdetails of the actual time and expense put on the test acre. It might be stated that this land lay immediately alongside the acre grown in 1916 and the soil was similar except that it was better drained.

Fall ploughing 5 hours $1.70, harrowing 68 cents, sixteen tons stable manure at $1.00, $16.00. Labour in applying it $3.70. Ploughing in manure, 5 hours, $1.70, harowing 68 cents. Fifteen barrels wood ashes at $1.13 1-3 per barrel, $17.00, 835 pounds acid phosphate at $23.50 per ton, $9.81. Nineteen and one third bushels Green Mountain potatoes at $2.40 per bushel $46.32. Cutting and disinfecting seed at 15 cents per bushel, $2.90. Planting 2 men and team, 4½ hours $2.43. Cultivating and horse hoeing three times, 18 hours, $4.86. Hand hoeing and weding, 2 hours, 40 cents. Pulling weeds 2 hours, 40 cents. Spraying 6 times, 9 hours with horse, $4.26. Spraying materials $8.08. Digging, 7 hours, man and team, $2.38. Picking, 51½ hours, one man, $10.30. Hauling to cellar $1.29. Rent of land $3.00. Depreciation of machinery and tools $4.00. A total cost of $141.88.

The yieild was 58 barr ls mraketable, worth $2.50 per barrel, 5 barrels culls worth 50 cents. Total value of crop $165.00, leaving a profit per acre of $23.12; a cost per barrel of $2.25 and a profit per barrel of 36 1-3 cents.

Had this crop been no better than the majority of fields in the province last season, viz., about 40 barrels per acre, the loss would have been over $4.00 per acre.

THE CO-OPERATIVE MARKETING OF WOOL

An Opportunity That New Brunswick Sheep Men Should Take Advantage of.

Marketing wool co-operatively is the only way in which sheep men can secure the full value for their product. The New Brunswick Department of Agriiculture realizing that the wool producers of this Province have suffered financially due to the method of marketing, that has prevailed in the past, and wishing to remedy this condition, and at the same time to give every encouragement to the sheep industry possible, has prepared a plan that will neable every wool producer to market his porduct to the very best advantage, i. e., direct to the manufactuer. In this way the middleman is completely eliminated. Under the old method of marketing the wool was sold to the country buyer. This was marketing at a disadvantage because the buyer had to have a profit—usually a good big one—for his trouble.

Co-operative marketing of wool is the method that obtains in every other Province of Canada except New Brunswick. In 1917 over 2,000,000 pounds of wool was marketed in Canada co-operatively. Each year the amount marketed and the price received has increased showing conclusively that thi smethod of marketing is proving popular with the sheep men wherever it has been tried.

Marketing co-operatively means that the wool is assembled at central grading stations where it is graded and then sold direct to the woolen mills according to grade. The advantages of this method are quite apparent and might be summed up as follows:

1. A large suantity of graded wool assembled at one point attracts the best buyers from all parts of Canada and the United States, consequently the best price obtainable is secured.
2. The wool grower with clean, dry wool receives a premium for nis trouble. The flat rate of so much per pound is displaced.
3. Marketing wool co-operatively leads to a greater interest in the sheep industry and also to better wool being produced.
4. Co-operative marketing or wool is a beginning and will lead to co-operation along other lines.

This is an opportunity that the progressive sheep men of this Province will be quick to grasp. Detailed information will be supplied upon reuqest. Write in for pamphlets and literature on the subject.—Department of Agriculture, Fredericton, N. B.

THE DAIRY COURSE AT TRURO

In connection with the special course in milk testing which will be conducted in the Agricultural College at Truro from March 13th to April 4th, it is well to note that new regulations have been made at Ottawa, which will result in the appointment of one supervisor for each Province. The work of testing wil be done localy and a charge of ten cents per test will be made inistead of five cents per test as formerly. The services of competent milk testers will be much more in demand than formerly and the course affords an excellent opportunity to qualify as a milk tester.

After a milk can has started to rust, the best method of procedure is to scour off as mucch of the rust as possible, and then follow the proper methods of washing and drying. It is understood, of course, that the cans should be protected from the weather and not allowed to stand out of doors or in damp, dark rooms.

THE MARITIME FARMER.

And Co-operative Dairyman

Registered Trade Mark

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. This paper is sent to subscribers unless a definate order for discontinuance is given.

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said:—"I saw" your adv. in the MARITIME FARMER.

BIG INTERESTS STILL RULE

Canada has been pretty thoroughly placarded by the Food Controller with appeals for conservation of Wheat Flour. These are shown in our homes, hotel dining rooms, restaurants, dining cars, etc. We are assured that the one big need of the Allies is wheat flour. In the United States they are recognizing this need by forcing the substitution of other cereals for wheat. The United States has not been in the war as long as Canada, but the authorities there, President Wilson and his Food Controller, Mr. Hoover, are really demonstrating to the world that they believe there is a war on. In Canada we have been asking the people to save wheat and we have been inviting Farmers to increase the production thereof. At the same time the Food Controller is allowing every flour mill in Canada to offer mill feeds in small quantities and insist upon the customer taking the balance of the car in wheat flour. This flour, in many cases, goes into warehouses, to remain until the merchant can dispose of his stock. In the meantime, if the Food Controller is to be believed, the Canadian farmers' sons in France are suffering for the wheat which we are thus locking up. The Food Controller has not yet worked up sufficient courage to tackle the big milling interests. He is not yet convinced that the lives of the men in the trenches are to be given first consideration. If Mr. Thomson really wishes to convince the farmers of the Maritime Provinces that wheat is as badly needed as he says it is, he will take the necessary steps to give practical proof of his belief that the life of the Canadian soldier and the safety of the British Empire are to be preferred to the big financial melons which the millers in Canada have been cutting for the past few years. It is time the cards were laid upon the table. When they are laid down there should be a full deck and the pasteboards should be turned face up. A good many people in this country are beginning to doubt whether wheat is as scarce as the Food Controller would lead us to believe it is.

THE DOG NUISANCE

The regulation of the Dog Nuisance in New Brunswick is now in a fairly good position. At the annual meeting of the several Municipal Councils of the Province the Law was put into effect in a number of the Counties. The change is a most desirable one because it officially recognizes for the first time that the counties adopting it are convinced that sheep are more essential to the Agricultural development of the Province than mongrel dogs. The law provides that a tax should be levied on all dogs. The monies so raised are to constitute a fund from which the farmers will be recompensed for losses sustained through the destruction of their flocks by stray canines. Every owner of a dog must register his animal. In cases where sheep are killed or injured and the identification of the dog's owner can be learned the master of the brute must make good the loss. The law would be much more effective if it went to the length of providing that all dogs in New Brunswick should bear a tag with the owner's number properly displayed. That would determine ownership without question. It should also provide that all dogs without such tags be destroyed on sight. Such a regulation has been adopted in many parts of Ontario and the sheep owners there feel that now they are in a position to more effectually take advantage of the splendid opportunity afforded by the present wool market. Legislation to bring about these reforms should also be sought in New Brunswick.

FERTILIZER IS SCARCE

The Bowker Fertilizer Company recently advised their N. B. Agents that they expected to ship a very small proportion of their usual New Brunswick allotment this year. The firm attributes its inability to send forward its usual supply to the heavy tax on the transportation facilities leading into the Maritime Provinces. The interruption in the steamship service from Boston to St. John has made it difficult to get the usual supply forward. The freight congestion on the railways of the United States has also been an important factor in curtailing the firm's output. While 1919 may seem a long way off to a good many farmers, the Maritime Farmer would suggest that the transportation problem will be even more acute next season. The argument of the Bowker Fertilizer Compan ytherefore will be correspondingly strengthened. It would thus seem to be in order for the farmers to get their fertilizer orders ready at once in order that they may be placed at the earliest possible date for shipment for the planting season of 1919. The N. B. Agricultural Societies United are prepared to handle fertilizer at cost for all Agricultural Societies joining the central organization. Some 40,000 tons of fertilizer are used in New Brunswick annually and there is no reason why the most of these goods should not be handled by the central body. The N. B. Agricultural Societies United has been able to reduce the cost of fertilizer to the farmer from $10 to $15 a ton. The larger the amount purchased through this medium the greater will be the saving all around. Agricultural Societies not already associated with the N. B. Agricultural Societies United, should lose no time in writing the secretary of the organization, Mr. J. D. McKenna, Sussex, N. B., who will be prepared to give all information necessary to enable the applicants to prepare orders for delivery in 1919. "Do it Now" is a Motto that applies admirably to the fertilizer outlook of 1919.

CO-OPERATION AMONG FARMERS ESSENTIAL

The need for co-operation among farmers is becoming more and more apparent. What has been accomplished in the west by the Grain Growers should be an inspiration to the farmers of Eastern Canada. We have various farm organizations. We may well ask ourselves what they are accomplishing. To date the net result has been the holding of various annual conventions and the passing of resolutions covering diverse subjects. With the adjournment of the convention, little if any, attention has been devoted to seeing that the objects aimed at by the resoluters are attained. What we want in the Maritime Provinces is a big central farmers' organi ation which will be in a position to speak and speak with authority in the agricultural interests of the Maritime Provinces. War conditions have wrought a great change in the horizon. Old ideals have been shattered and new conditions will arise the very day that peace is declared. The whole social fabric of Canada will be turned inside out and if the farmers are wise they will be prepared to meet changed conditions. The time to start is NOW. Every effort should be put forth to get farmers together in support of their mutual interests.

LEND A HAND

Everyone not only has the right, but the duty to be happy. Life might mean much more to both the individual living and to everyone else. And it is by no means an impossible philosophy. It requires only a little wise effort and a good deal of just plain, right thinking. It is partly a habit and a contagious one, tnerefore of good influence. Why is it not just as easy to see the sunshine as the cloud, just as well to for the good, the true, and the beautiful, as to be always finding only evil, false and ugly things? The answer lies with each individual, within that intangible part called the heart and the soul. The mind, too, has its mission, a directing and adjusting responsibility. It has been said that, "as a man thinketh in his heart, so is he," but he is lacking when he fails to conrtol and to fashion these thoughts as much as he might.

It is something of a burden to go out in cold weather, and it does not look sensible to stay at home and work instead of driving to town or visitnig, but in the end it pays to get out frequently. The exchange of ideas, the fresh air, the change of scene and the mingling with people other than one's family all do good in a physical sense, and when it comes to the mental state there is nothing that so stimulates a woman as fellowship with those outside her home.

So don't imagine yourself superior to the woman who goes about all winter, if you house up and refuse to budge from your own fireside. You may save the price of a new dress or wrap or hat by staying at home, but on the other hand you may lose more than that in paying the doctor. And if you do keep on going you will be a far better wife and mother than you possibly could be if you stayed on the job every minute. Maybe you don't believe this, but eminent physicians say it is true and they know.

* * *

The surest way to train a boy is to appeal to his imagination, to help him to see what you are trying to do and to gain his co-operation. Without him as an interested ally you will be balked at every turn.

SEED LABORATORIES HELP THE FARMERS

The Seed Branch of the Dominion Department of Agriculture maintains laboratories at Ottawa and Calgary where seeds are tested for purity and vitality. A large proportion of the samples received at the former laboratory and a smaller proportion at Calgary are sent by merchants in connection with the grading and germination of seed as required by the Seed Control Act.

In these government laboratories there are, on file, samples of every lot of timothy, red clover, alsike and alfalfa seed, which are officially graded and exposed for sale in compliance with the requirements of the law in Canada. Certificates isued to the senders of the samples, show not only the grade of the seed but the number and kinds of the different weed found in the sample. In buying seed farmers may insist on seeing copies of the certilcates covering the seed offered to them, and if for any reason they suspect the seed to be misrepresented, they have the privilege of sending a sample of it to the laboratory on their own account. In sending samples, it is essential that they be thoroughly representative of the bulk lot of the seed from which they are drawn, and in case the seed has been tested before, the original test number should be quoted, so that the two samples from the same lot mey be compared.

Sowing 500 Weed Seeds to the Square

A sample which the sender called timothy, and which he stated was intended for seeding, was recently received at the Ottawa Seed laboratory, and found to contain 15,744 weed seeds per ounce, (there are 82,000 timothy seeds in one ounce). Sowing thiis seed at the rate of 10 pounds per acre would place about 500 weed seeds on each square yard. Another sample also called timothy contained 25,328 weed seeds per ounce. Sometimes the impurities in seed are of such size that they may be easily removed by the use of the proper screen and it is the custom of the laboratory to recommend screens in such cases. Recently a farmer's sample was found to contain 1632 weed seeds per ounce but after recleaning as directed by the laboratory only 96 were found.

Losses Through Use of Low Grade Seed

The use of impure seed is often the cause of considerable loss. Last season an Ontario farmer sowed flax containing several wild mustard seeds per ounce. This farmer considered that the use of this seed damaged his farm to the extent of several hundred dollars.

A Quebec farmer last spring sowed barley which a subsequent germination test showed to be of very low vitaliity. The result was that he has not only lost his nurse crop and wasted good feed but noxious weeds were enabled to multiply to such an extent that succeeding hay yields must be considerably lowered. Last season many field had to be seeded a second time because the seed used was heated or otherwise lost its vitality. Grain is so scarce and a crop failure means so much now, that every reasonable precaution should be taken this year against using as seed grain that is not of a strong vitality.

The information furnished as a result of a thorough test of a lot of seed enables one to use it with intelligence. Canadian grown red clover seed containing quite a large number of such seeds as lamb quarters, plantain and foxtail, might be preferable to imported seed containg only two or three weed seeds per ounce, if they were wild carrot, bindweed, or some of the other very objectionable weeds.

It is only when the weed seed content, vitally and other qualities of seed are know that an inteligent estimate of its seed value can be arrived at.

Vitality Tests Especially Necessary This Season

Germination tests of all grain to be sown this spring are especially necessary at this time. The area that can be sown and the thoroughness with which it can be prepared are determined largely by available labour and weather conditions. After seeding, yields in most cases depend largely on fertility of the soil and climatic conditions, the latter being entirely beyond our control. Plant diseases and insect pests can of course, be dealt with to som eextent. To stake money and labor on a crop doomed to partial or total failure by the use of dead, weak or inferior seed is in ordinary times very foolish, but to fail in this way now is to be unfaithful in one's duty. Moreover, sowing grain that will not grow not only incurs crop failure but is a waste of valuable feed. Every spring thousands of bushels of grain and corn that should be fed to animals are put into the ground as seed, and thousands of acres of valuable land produce less than hey should because of this. The loss is a double one.

Every lot of grain to be used as seed should be tested for germination no wso that there will be plenty of time to locate a suitable supply, should the seed on hand be found unsatisfactory . Farmers who desire seed samples tested for purity or germination may send them free of charge up to twelve ounces in weight, in strong envelopes or cotton bags addressed to The Seed Commissioner, Ottawa.—Seed Branch, Ottawa.

THREE VALUABLE BULLETINS ON FOOD PRODUCTION IN NOVA SCOTIA

Important Announcement of Policy of Department in Regard to Seed and Bigger Implements

Three imoprtant Food Production Bulletins have recently been issued from the Nova Scotia Department of Agriculture and will be widely circulated in a few days. Those who are not on the mailing lists at the College may obtain these bulletins FREE on application to the College at Truro. The first buletin on "Wheat Growing in Nova Scotia" written by M. Cumming, Secretary for Agriculture, and S. J. Moore, Dominion Seed Inspector. In this buletin in addition to much practical information, will be found a statement of the Department's policy to insure an abundant supply of seed wheat in Nova Scotia for 1918 seeding, in connection with which it may be added that upwards of ten firms in the Province have undertaken under this policy to handle at least a car of seed wheat, which with local supplies available should give the farmers of Nova Scotia an ample quantity of seed.

The second bulletin in on "Bean Growing" by Prof. P. J. Shaw, Horticulturist at the College. It deals with the importance of every farmer and gardener in Nova Scotia growing at least sufficient beans for himself and family. It is pointed out that Beans are the best known substitute for beef. They are grown in fairly large quantities in the Annapolis Valley, but owing to their tenderness have not been grown very extensively except as wax beans in Eastern and Northern Nova Scotia. In this bulletin the author states that the Department of Agriculture has located and can put buyers in touch with growers of several hundred bushels of hardy strains of Nova Scotia grown seed beans that will ripen from ten days to two weeks earlier than the average beans, and can therefore be planted to advantage on many farms where beans were considered an impossible crop. In addition to this the bulletin contains information in regard to methods of growing, amount of seed required and many other practical details that should prove of interest to every gardener and farmer in Nova Scotia.

The third bulletin is on "Greater Labor Efficiency on the Farms of Nova Scotia by Using Bigger Implements" by Prof. J. M. Trueman of the Agricultural College. In this bulletin, striking arguments are set forth for the more extensive adoption of two furrow plows and wider harrows by means of which every man on the land can increase the amount of land cultivated. It is pointed out that three horses and one man with a two furrow plough can turn over about as much land in a day as four horses and two men, and it is urged that, since man labor is the most scarce and expensive kind of help on the farm, many farmers should adopt the three or four horse hitch and larger implements and so make each man more efficient.

In this bulletin an announcement is made by the Secretary for Agriculture **that the Department of Agriculture of the Government of Nova Scotia will pay a bonus of 25% of the cost of two furrow ploughs bought in the Province of Nova Scotia between now and the first day of May next.**

These three bulletins are all valuable and timely bulletins and should be in the hands of every progressive farmer in the Province of Nova Scotia.

SUCCESSFUL SHORT COURSE AT TRURO

The short course at the College of Agriculture, Truro, was completed on Thursday, January 10th. The enrolled attendance was 180 and in addition there were several one or two day conventions and a very considerable intermittent attendance which would bring the total number who took advantage of the educational work up to about 350. The attendance would have been at least 100 larger had it not been for the blocade on the Railways last week which held up practically al of the Eastern delegation.

From the standpoint of work done, and of the interest taken, the staff are unanimous in considering the 1918 short course to have been the best yet given at the College. Special attention was given to the matter of the using of the best kind of seed, and the improvement of the live stock of the country. At the conclusion of the course, two boxes in which oats had been grown were exhibited to the class. One box was seeded with a certain amonut of common feed oats, and the other box with a like amount of selected seed oats. The result was nearly double the number of plants in the second box, and a very considerable better growth. From this illustration the importance of buying if need be a lesser quantity of high class seed oats instead of a larger quantity of a low class feed oats was urged on every student present and the lesson was applied to every kind of seed.

Similar ocular demonstrations were given in regard to live stock and many other phases of agriculture. The result was that practically every student left the course having adopted the suggested New Year's Short Course resolution of "No Food Shortage If We Can Help it."

This is the fourteenth short course which has been held at the College of Agriculture in Truro. The beginning in 1905 was small, but since that time the course has grown in popularity and influence until today it is doubtful if any other single factor contributes to the advancement of Nova Scotia Agriculture than the Truro Short course.

VALUE OF TRACTORS IN HAULING GRAVEL FOR MAKING ROADS

Records were recently kept very carefully of the cost of hauling gravel for doads which show the value of horse and mechanical traction under similar conditions. About twenty-two miles of road had the gravel distributed over them by teams and about 3.6 miles were covered with gravel hauled by a caterpillar tractor outfit. Itemized cost records were kept so carefully that the results of these two methods of hauling can be compared.

Using teams, it was found that the cost of loading and hauling a cubic yard up to one-half a mile ranged fifty-seven to ninety-four cents per mile. Where the hauling was one-half to one mile the cost per mile ranged from thirty to forty-eight cents. Where it was from one to one and one-half miles the cost was twenty-three to thirty-five cents, and where it was between one and one-half to two miles the cost per mile was twenty-two to twenty-eight cents. The detailed figures show that the cost depends largely upon the efficiency of the men engaged in loading the wagons. These loading costs varied from seven to ewenty-five cents per yard. The least figure was obtained by making the teamsters help in the shovelling and the highest figure was due to an excessive amount of frost and firewater.

The tractor outfit consists of a gasoline driven caterpilalr tractor the type of machine upon which the design of the British army tanks is based, seven three andone-half yard spreading wagons, a fifty yard storage bin and a loading machine. The work was complicated by a very heavy grade at one place. The best that could be done here was to haul four cars across private land and then go back and haul the remaining three cars across this rough ground. A full train was then made up and hauled the remaining two and one-half miles. The total average haul was about three miles. As the work progressed another gravel pit was opened where these grades did not exist and the hauling was done more easily. On the first part of the work the average cost was 15.4 cents per yard per mile and on the latter it was 15.41 cents.

The engineer who reported these figures has stated that with a more powerful tractor and a loading outfit of greater capacity, a much lower operating cost could have been obtained with the tractor outfit. It is his opinion that with proper equipment, mechanical traction of this type is much cheaper than hauling by team. There are also other advantages which he has summed up as follows: By applying the gravel in two courses with a tractor, the gravel is rolled without additional cost and the road is ready for travel as soon as the tractor leaves. Furthermore by loading the gravel into a bin, thence into wagons and finally dumping it on the road, the material is better mixed than when it is shoveled directly from the bank into the wagons which dump it on the roads.

AIM TO PRODUCE PORK MORE ECONOMICALLY

Many farmers could produce pork more economically than they are now doing. Instead of selling off the last bacon hog this autumn, the Canadian farmer should keep one or two of the best young sows for breeding. It will cost but little to winter them; in fact, they are best kept in thrifty condition when not too fat. Next spring, arrangements should be made to have an out-door run for the pigs during the summer. A small field of clover, or an acre or two sown to rape or oats and vetches would be an excellent and economical place to raise the pigs. The green feed, supplemented by a little grain, and plenty of clean water will produce thrifty pigs and grow them cheaply to a size ready for quick finishing with a heavier grain ration in the autumn.

One prominent writer in the United States goes so far as to say that the supply of fats will be the deciding factor in the war. Certainly it is essential that immediate steps be taken to increase the production of pork in Canada. Some farmers seem to be prejudiced against those who are urging and working for increased production. The present, however, is a serious time, and petty prejudices should be utterly forgotten in one great effort to win the war. Only the farmer can do much to actually increase the supply of bacon. He has a great field for service in this matter, and a rare opportunity to supply, with profit to himself, what is greatly needed.

HORTICULTURE

MORE HONEY IS WANTED

An Opportunity for Bee-keepers

Sugar is an important war food, its price is high and there will probably be a sortage in the near future. Honey the unequalled natural sweet that sugar cannot wholly replace, is being affected in sympathy. The unusually large crop of honey produced in Ontario, Quebec and Manitoba in 1916 was sold quickly at prices slightly above those o fthe previous season and present indications point to a still greater demand and higher prices for the new crop. Thus, by prolucing as much honey as possible this year, the bee-keepers of Canada will not only increase their returns but will be helping the Empire. These remarke refer to extracted-honey. An increased demand bor comb-honey cannot be predicted.

The appeal for greater production is especially to those who are neglecting their bees or are not managing them in the best manner. There are many apiaries in good locatition for profitable honey production more particularly in Eastern Canada, where colonies in box hives or in seldom-opened frame hives now producing from 20 to 40 pounds of honey each could be made to produce 80 to 100 pounds or more in an average season. If time cannot be spared to give the bees the attention they need, they might be handed to a member of the family who would take an interest in them, or they might be sold to a professional bee-keeper. But well mananged bees often pays as well as, or better than, one's regular occupation for the amount of time spent with them. The different operatoins in modern apiary practices are breifly described in "Bees and How to Keep Them" (Experimental Farms Bulletin No. 26 26, Second Series) which may be obtained free on application from the Publications Branch of the Department of Agriculture, Ottawa. A good way to become acquainted with the better methods of bee-keeping is to arrange to attend one of the apiary demonstrations that will be held early in the summer, under the auspices of several of the Provincial Bee-keepers' Associations. A list of the Bee-keepers Associations with the addresses of the Secretaries is given in the above mentioned buletin.

Another class of bee-keeper that may profit greatly at this time is the exeprt apiarist located in a good honey producing region, whose time is not fully occupied with the bees. His principal problem will b ehow to increase the number of bees to the fullest extent in time for the honey flow, so as to make the most of his valuable knowledge of bee management. The early replacing of unsatisfoctory queens is important. Judicious feeding during the dearth that in many places immediately preceres the honey flow will help under some conditions. By dividing strong colonies not less than six weeks before the middle of the main honey flow an increased crop of honey will be obtained, provided fertile queens may be procured from breeders in the Southern States at from 80 cents to $1.00 each. This procedure is chiefly applicable to the fireweed and goldenrod districts; as a rule the clover honey flow comes too early for it. Two-pound packages of bees with untested fertile queens obtained from the south by express in May or early June costing about $4.00 each, including transportation charges will be found a paying investment, if they arrive in good condition and can be placed on combs.

There should be a sufficient supply of supers for extracted honey, with frames and foundations, or combs, on hand to take a maximum crop, and this year it is more than ever necessary to order supplies and honey containers early. Two-comb supers may be fastened together to make one dep super f roextracted honey production. Particulars of an attractive container for honey that has been designed to meet a possible difficulty in obtaining sufficient tin pails or glass jars will be supplied on aplication to the lApiarist, Central Experimental Farm, Ottawa. Beeswax is very scarce and all discarded combs and scraps of wax should be saved to be turned into foundation. It will be wise to retain some combs of clover honey in case they are needed for winter stores, becauhe sugar may be very dear in the autumn.

TO ENCOURAGE BEE-KEEPING AND HONEY PRODUCTION

The New Brunswick Provincial Department of Agriculture announces the apointment to the Horticultural Division of Mr. Leonard T. Floyd, of Bloomfield Station, Kings County, as "Provincial Apiariist."

Mr. Floyd comes to this position with good practical qualifications, for in adidtion to his general agricultural experience at his farm at Bloomfield, he has specialized successfully for the last ten years in beekeeping and the growing of small fruits. He has been President of the New Brunswick Beekeepers' Association for the past four years and has taken an active interest in the advancement of beekeeping in this province.

Mr. Floyd wishes to get into touch with as many beekeepers as posible and invites correspondence on all phases of beekeeping and honey production. He will be glad at all times to give information and advice on such matters.

The production of honey is in these times, more important than ever and the Department realizes the need of, and desire to encourage and improve, the beekeeping industry of this province. For this purpose it has appointed Mr. Floyd and he will personally visit as many of the beekeepers as possible, so that they may have, at first hand, the benefit of his experience and advice. Address all enquiries to L. T. Floyd, Provincial Apiarist, Department of Agriculture, Fredericton.

CONDITIONS FOR SUCCESSFUL BEE-KEEPING

The first requisite for sucessful beekeeping is that the owner of the bees should be interested in them. He will then study their ways and will learn to manage them well. He will learn from bee books and journals as well as by exeprience, and, also pehaps, from the friendly advice of a beekeeping neighbor.

Another important condition is an abundance of honey-producing flowers within a mile or two of the apiary. There is hardly a place in the settled parts of Canada where this condition is not fulfilled to some extent. The kinds of plant that produce the bulk of the surplus honey are not many. By far the most important are alsike and white clover found on almost every farm, and most plentiful, of course, where they are grown for hay, pasture or seed. In southern Alberta and the dry interior of British Columbia, clover yields first place to alfalfa, and in the semi-cleared lands of the north to fireweed (**Epilobium angustifolium**) a promising honey plant which is now the subject of a special investigation by the Be Division of the Experimental Farms. Among minor sources of surplus honey are buckwheat and basswood in southern Ontario and southwestern Quebec; goldenrod an daster, principally in eastern Canada; wild raspberry, sweet clover, Canada thistle and various weeds. Red clover is an example of a plant containing abundant nectar in which the flowers are too narrow and deep for the bees to collect it.

A third factor of great importance is suitable weather for the development of the honey plant and for the secretion and ingathering of the nectar. In the case of most plants, including white and alsike clover, a moderately wet spring followed by fine, warm weather when the plants are in full bloom, produces the best results. In such a season it is not unusual to get 150 pounds of honey per colony in a good clover district. On the other hand, continuous rain or broken weather during the honey flow may prevent the production of any surplus honey. We cannot forecast the weather in any part of the country, so that the honey crop is as uncertain as any farm crop. In 1915 the highest yeild per colony from clover was obtained in Nova Scotia; in Ontario the crop was only moderate, and in the lower mainland of British Columbia a failure. In 1916 Nova Scotia gave less than the average, Quebec, Ontario and Manitoba far above the

Double the Crop and Better the Quality

Good Fertilizer will increase the crop, produce better quality and give a higher market value. The best investment a farmer can make right now is FERTILIZER. Buy your supply early as there is shortage of raw materials and you can also get better freight service now than later in the season.

Bigger Crops, Better Quality, Higher Prices
—If You Use—

"Best-by-Test" FERTILIZERS

This brand of Fertilizer is noted for high plant food value and the analyses are guaranteed in every bit of it sold. Write for free book on Fertilizer giving information as to kind and quantity to use for different crops. Farmers club together and order in carload lots and get special rates. Full particulars on request. Local Agents wanted.

Insure Your Crops
With a
Spramotor
It isn't a SPRAMOTOR unless we made it

You find it good business to insure your life, your health, your home, then why not insure your crops upon which your livelihood depends. A few minutes' work with a Spramotor at suitable intervals will rid your crops of fungus diseases, and assure their arriving at maturity in that hard, healthful condition that secures first-grade prices. We have Spramotors adapted for every kind of spraying in every port of the world. Let us quote you prices and terms to meet your own special needs. Meanwhile write for a copy of our booklet which describes the various styles of Spramotors and gives valuable information about their treatment of crop diseases.

Made in Canada. No duty to pay.

Minard's Liniment Co., Limited.

Gentlemen,—My daughter, 13 yrs. old, was thrown from a sleigh and injured her elbow so badly it remained stiff and very painful for three years. Four bottles of MINARD'S LINIMENT completely cured her and she has not been troubled for two years.

Yours truly,
J. B. LIVESQUE.
St. Joseph, P. O., 18th Aug., 1900.

average, and the lower mainland of British Columbia again a failure. In 1917 Nova Scotia recorded a failure; southern Ontario almost an average; Quebec and Manitoba below the average and the lower mainland of British Columbia a bountiful crop. The shifting of the good yield from one region to another was due to weather conditions. In the aggregate returns, however, Ontario and Quebec led, the Maritime Provinces came next, and British Columbia third, a comparison of considerable importance to the specialist but less to the amateur.

The rise in sugar has ben reflected in the honey market. In the last two years the demand for honey has been very great; the price has risen 3 to 5 cents a pound within the past few months, and white extracted honey at the time of writing is being quoted at 14 to 17 cents per pound wholesale.

Bee-keeping neds but little capital, can be carried on anywhere, even in a vacant lot in the city, and is not particularly laborious. The bees require attention only in pleasant weather, knowledge and foresight being needed to do all that is necessary until the weather is again likely to be favourable.

PREPARE TO PROTECT YOUR CROPS NEXT SEASON

Throughout the country there was a splendid response during 1917 to the call for increased agricultural production. Larger crops were raised on the farms, and city dwellers by the cultivation of gardens and vacant lots contributed greatly to the success of Canada's efforts to relieve the world-wide food shortage. Greater production of food supplies than ever is required next year, for field crops are not only required to meet immediate human needs, but increased production of hogs, dairy products, and beef are dependent upon such crops.

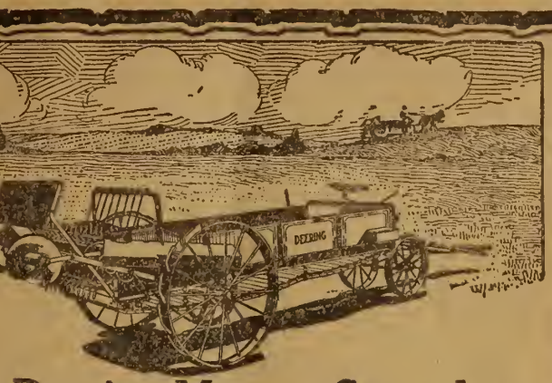
The production of maximum crops demands constant watchfulness and effort on the part of the farmer, fruit grower and vacant lot cultivator in order that such crops may be protected from the numerous pests that attack them. We repeat: "Crop protection means crop production." Insect pests destroy annually from 10 to 25 per cent. of all crops grown. The total loss to the country is enormous; if we express the aggregate loss inflicted annually by insect pests to the field crops of Canada in terms of wheat we find the total loss is sufficient to feed the entire population of the coutry for one year. Much of that loss can be prevented. At the present time it is incumbent upon us to take every means to prevent it. Insects can be as effective as enemy submarines in destroying food suplies. Like submarines, they are insidious in their operation. They must be sought out and destroyed.

Now is the time to make preparations for the next year's offensive. To be prepared is half the battle. Lack of foresight and due preparation means disappointment and loss. The greater cost of production and the greater need of more crops makes crop protection all the more necessary. Utilize the present quiet season to make plans for next year's campaign. According to the crops that are grown and the insects that occur in your district make preparations now if preventing their ravages next season. Owing to the sudden demand during the period when insects were active last summer for insecticides such as lead arsenate, and Paris green, a serious shortage occurred in many places with consequent higher prices. This can be avoided if growers will obtain their requirements before spring. Insecticides are the growers' ammunition, ample supplies of which are necessary to a sucessful offensive. Fruitgrowers should now determine their requirements and take steps to meet them. Growers of potatoes and other field crops subject to insect attack should obtain supplies of the standard insecticides to meet their needs: arsenicals for insects such as grashoppers, potato-beetles, cut-worms and other caterpilalrs that devour the foilage; contact insecticides such as whale-oil soap and nicotine preparations for such insects as plant lice or aphids. All spraying machinery should be thoroughly overhauled, cleaned, oiled and in readiness for use when required in the spring, as the spring is a busy tiime for the grower. Such timely preparation will mean not only the saving of time—an important matter when labor is scarce —but it will also mean the saving of crops, for a few days' delay in applying preventative or control measures will frequently result in serious losses from insect pests.

When it is possible rubbish and trash of al lkinds should be cleaned up and burnt. A clean farm, orchard or garden means fewer insect pests. Weedy fences and fields and accumulations of rubbish provide hiding places for these crop destroyers.

It will be advisable to watch seeds of all kinds that are stored under

(Continued on page 334)



The Deering Manure Spreader
Light Draft — Wide Spread

A LOAD of stable manure is no light weight. Matted with bedding and litter, it is no easy job to tear it into small pieces for the kind of spreading that good farmers demand. Yet two horses can handle easily the 49-bushel load of a Deering No. 8 in all ordinary going, and will get the load off in a good even coat in three to four minutes. With its light weight, roller bearings, and beater parts kept in line by a strong steel frame, the Deering is a very light draft machine.

The work of tearing up the manure is divided between two beaters, one of which is a spiral that makes this Deering spreader a wonderfully efficient fertilizing machine. It spreads beyond the wheel tracks. It covers the ground evenly clear across the width of the spread.

Three sizes of Deering spreaders give each farmer a machine suitable for his farm—No. 8, 49 bushels; No. 5, 55 bushels; No. 6, 63 bushels capacity. See the local dealer or write the nearest branch house for illustrated catalogue showing all the good features of this Deering light draft, wide-spread manure spreader.

DAIRYING.

Editor Maritime Farmer,
Sussex, N. B.
Dear Sir:

Holstein sales have been very good this past fall and winter. Among recent sales were two real nice heifers to Mr. C. E. Hamilton, Lower Truro. One is a granddaughter of our old cow Locust Hill Nellie 3rd and is a very large, growthy heifer. Unless all signs fail she will make a cow that will be heard from later. The other is a daughter of Raylton Canary Major whose heifers areturning out great milkers. Several have milked from 13,000 to over 15,000 lbs. in one year with first calf as two year olds. Mr. Hamilton is a good stockman and we expect to hear about these heifers later.

Mr. F. M. Williams, Westchester Sta., got a nice heifer calf out of a daughter of Royalton Canary Major and by PrinceColanthus Canary B. also a bull calf out of Cobequid Helbon May, a very fine cow that is proving well at the pail. A bull each to Scott's Bay Agricultural Society, Margaree Harbor Apricultural Society and East Margaree Agricultural Society.

Our cows are milking well considering the chance they had. Our turnips were a poor crop last season and let me tell you right here we miss them. However, the cows are averaging apout 33 lbs. a day and we have a lot of first calf heifers among them, which hauls the average down.

Miss La Handa dropped a dandy bull which we intend keeping for a herd bull. He is a beauty.

Prince Colanthus Canary B. is developing into a very fine bull, his granddam, Madame Porch Pauline finished a years record of over 28,000 lbs. milk, her second record over 28,000 lbs. in a year. The calves sired by him are very promising, well marked, low set and straight.

Yours truly,
A. E. DICKIE.

THE COST OF MILK PRODUCTION AND THE FARMER'S PROFIT

The principles of cost accounting used in manufacturing should be applied to agriculture, ,not that the farmer may always sell above cost, for at times he sells below cost, but that he may know that the average selling price will at least equal the cost and thus allow him to break even. Were the results of such cost accounting for the business of milk production known to the farmer as well as the consumer, the former would bestir himself to reduce his cost while the latter, recognizing the narrow margin of profit upon which the farmer is working in producing a staple food product, would cease his blind criticism and be willing to pay a fair price for milk which is one of his cheapest foods.

To find the cost of milk production is no sinecure in accounting, ,because of the complexity of the conditions surrounding the industry, but the importance of the product has led to many investigations with the following average results, using present day feed and labour charges,—

Expenditure per Cow

Feed at cost prices	$ 82.90
Labour per cow including handling of milk	55.27
Interest and depreciation on herd per cow, $110 at 11%	12.10
Interest, insurance, repairs and depreciation on buildings	8.72
Depreciation on equipment	.50
Losses from abortion, tuberculosis pneumonia, etc.	1.95
Veterinary services and drugs	.86
Cash sundries	1.96
Added interest of owner in excess of that exhibited by hired help	6.00
Total	$170.26

Receipts per Cow

6167 pounds of milk at 29c per gallon	$178.84
12 tons manure at $2.00 per ton	24.00
Total	$202.84

Under the above conditions milk costs the farmer 27.6c per gallon or 6.9c per quart. At most he is selling it for 29c per gallon or 7.25c per quart. The profit left to the farmer is very little over the value of the manure for his farm. In one investigation conducted on twenty-five dairy farms keeping on an average of 460 cows, the average profit per cow per year was $8.23 while out of the twenty-five dairies 28% reaped no profit whatever.

While 6,167 pounds of milk per cow per year may seem a small yield to some farmers, it is in reality a very good average, exceeding the average for Eastern Canada by 2,000 pounds. The farmer's remedy lies in increasing the average production of his herd.

A Word to the Consumer

one of the cheapest foods. Instead of being regarded as a luxury it should be regarded as a necessity. Based on food values it has been estimated that if porterhouse steak is worth 30c per pound, milk is worth 16.5c per quart; if eggs are worth 30c per dozen, milk is worth 21c per quart; if fat fowl are worth 20c per pound, milk is worth 20c per quart; and if white fish is worth 18c per pound, milk is worth 32c per quart. No common meat food is cheaper than milk at 15c per quart. Moreover, milk is an already prepared food, requiring no fuel to cook it, a most important consideration under present fuel conditions.

The question is "Who is getting the best deal?" Certainly it is not the farmer.

FROM THE HOLSTEIN-FRIESIAN ASSOCIATION, BRATTLEBORO, VERMONT

The large size of Holstein cows not only enables them to yield in such enormour quantities as to give them all records for milk and butterfat production, but is in itself a decided advantage in these days of high beef prices. The ultimate destination of all cows is the butcher's block, and the heavy Holstein is winning laurels here over the smaler cows as she does at the pail.

A purebred registered Holstein heifer, 2 years, 10 months of age, which has been found worthless for breeding purposes, was recently sold at the Buffalo (N. Y.) Stock Yards for $201.45. She weighed 1580 lbs. and brought 12¾ cents a pound. She had been bred to freshen last May and was being fitted for a test, but as the time of her parturition approached she did not make up any udder. Upon examination by a veterinarian it was found she was carrying a mummified calf. She was kept until fall and then disposed of for beef.

In these days when every scrap of food is worth its weight in gold the several hundred pounds more weight of the Holstein cow is a factor to be reckoned with in selecting dairy stock. In many instances the difference in weight will make a difference in price paid by the butcher sufficiently large to pay the difference beteween the initial cost of a purebred Holstein and a "scrub."

THE QUEEN OF THE DAIRY WORLD IS DEAD

The great purebred Holstein, Duchess Skylark Ormsby, who made the world's record for all breeds of 1506 lbs. of butter, 27,761.7 lbs. of milk in one year, is no more.

Duchess Skylark Ormsby was calved October 31.1909. She was owned by R. B. Young, Buffalo Center, Iowa. She freshened first at 2 years, 1 month and 3 days old. She was put on official test, making the creditable though not noteworthy record of 17.50 lbs. of butter, 380.2 lbs. of milk in seven days. Continued for the year, she made the fine record of 731.1 lbs. of butter, 18,966.5 lbs. of milk as a junior two-year-old. She then passed into the hands of John B. Irwin, Minneapolis, Minnesota, and for him, at 5 years and 3 days old she made 34.36 lbs. butter, 588.1 lbs. of milk in seven days. It was then decided to run her for the full year. 327 days after freshening she produced 23.75 lbs. of butter, 469.2 lbs, milk. November 9. 1915 it was officially announced that she had established a world's record with the tremendous output of 1506 lbs. of butter, 27,761.7 lbs of milk in 365 days. This exceeded the previous world's record of 1470.59 lbs. of butter held by the Holstein cow Finderne Pride Johanna Rue.

The champion was but eight years old at her death and her loss is a great one, not only to her owner, but to dairymen and breeders generally.

Her only living son, Sir Ormsby Banostine Champion, is in active service and his sons and daughters have every indication of perpetuating the beauty symmetry, constitution and persistent milking qualities of his great dam.

STABLE MANNERS THAT INCREASE MILK FLOW

Every conscientious dairyman knows from experience, how difficult it is to secure in his hired help men who at all times will treat his animals with consideration. The dairy cows has been called a machine—and in a very true sense she is such. But a cow cannot be treated like a machine. She is a bundle of nerves. The disturbance of her nervous equilibrium upsets her production. For this reason harsh treatment has no place in the dairy stable. Kindness and gentleness are essential at all times. Years ago a certain dairyman put up a printed notice in his stable urging his men to practise patience with his animals. The sign is still there preaching its little sermon to the men who come and go on this particular farm. It reads as follows:

"The rule to be observed in this stable at all times towards the cattle, young and old, is that of patience and kindness. A man's usefulness in a herd ceases at once when he loses his temper and bestows rough usage. Men must be patient. Cattle are not reasoning beings. Remember that this is the Home of Mothers. Treat each cow as a mother should be treated. The giving of milk is a function of motherhood; rough treatment lessens the flow. That injures me as well as the cow. Always keep these ideas in mind in dealing with my cattle."—O.C.

UDDER TROUBLES GENERALLY ARISES FROM INJURIES

Many udder troubles are due to injuries. The cow owner may not always realize this nor be aware of the different methods by which a cow can injure herself. High door sills, running the cows when their udders are full, requiring them to lie on cold floors or frozen ground are all prolific sources of trouble. Some cows have very low-hanging udders that drag when they step over obstructions in their paths. Here is where high door sills may be injurious. The udder

Ten to Fifteen Acres Per Day

THINK what it means in a late season to get your plowing, harrowing, seeding and harvesting done thoroughly and quickly—and at a remarkably low operating and up-keep cost. Instead of costly feed for horses, taking many acres away from your available land to supply, you reap these big advantages, not with expensive gasoline, but with cheap coal-oil! That is the fact that is compelling thousands of farmers to adopt the

Happy Farmer Tractor

Model A—8-16 H.P.
Model B—12-24 H.P.

The saving between coal-oil and gasoline alone would pay handsome dividends! But when you compare with the cost of operating by the old fashioned horse method, no wonder Happy Farmers are in use everywhere.

Size, weight, simple construction and ease of handling all prove to the most exacting farmer that here at last is the ultimate tractor for the farmer. For instance, Model B with 2000 pounds draw-bar pull does the heaviest of plowing easily with a weight of less than 4000 pounds. That means economy all around. Yet the machine is light enough to handle the harrows, drills, and seeders over soft ground without packing the soil.

Any farm lad can run this simple tractor with few parts to get out of order. It will turn around within its own space. It turns sharp corners and plows right up to the fence.

Model B delivers 24 horsepower for every kind of legitimate farm belt work handily. For those who prefer less power, Model A delivers 8 h.p. at draw bar and 16 h.p. for belt work.

Write for prices, terms and full descriptive literature.

THE CANADIAN SALT CO. LIMITED 223

striking the sill is bruised and an inflammation is set up that may result in the loss of the usefulness of the animal unless properly cared for. Sometimes injuries of this sort are received in the pastures by the cows stepping over logs, stones, brush, etc. and the only way to avoid them is to remove such debris from pastures and barn lots.

Lying on cold floors or on the bare ground may not bruise the udder, but it chills this organ so that it becomes congested and inflamed. This can be prevented by providing the cows with plenty of clean dry bedding at all times and keeping them in the stable during severe weather and at nights. Sometimes a bad bruise may be sustained by an animal that is kept closely stabled. Her udder may be stepped on by the cow in the next stall. This is particularly liable to happen in certain types of stalls and with cows that have large udders.

Cows should never be hurried when driven from the pasture. The well-filled pendulous udder will swing from side to side and be bruised. No doubt many cases of bloody milk and so-called garget are caused by driving the cows with dogs or by unthinking persons. If more care were taken in the handling of milking cows there would be less complaint from udder troubles.

A COW DEAL

Bought a cow t'other day;
Man was getting short of hay.
Rather sell his wife, he said,
Or part with anything he had,
But his hay was getting low,
And the cow had got to go.
"Such a cow," says he to me,
"Is something that you seldom see;
Gives two pails twice a day,
Only eating medder hay.
Give her shorts and cottonseed,
Another pail you'll surely need.
Butter that 'ere cow will make
Can't be beat in Canada.
Her mother took first money at
The country fair for butter-fat."
I shaved him ten and took the cow,
Wish I hadn't done it now.
Felt like I'd been stealing sheep,
'Cause I got that cow so cheap.
Of course it wa'nt exactly right
To take advantage of his plight,
But turn it round and I could see
That he would do the same to me.
I took her home and gave her feed
Of ensilage and cotton seed.
Could hardly wait for milking time
So as to try that cow of mine.
I won't attempt express my thoughts
But all I got was just three quarts.
Yet he told the truth, when, says he,
A cow like this you seldom see,
For her udder was bigger when done
Than it was before I had begun;
But strip and strip, it was no use,
There wasn't another drop of juice.
Next cow I buy I will not fail
To inquire the size of the milking pail.
—Exchange.

BADLY ADJUSTED SEPARATORS CAUSE LOSS

Butter-fat and profit may be run into the skim milk can if the separator is not properly adjusted. One Wisconsin creamery man has found, by repeated tests, that skimmed milk obtained upon farms where hand separators are used oftentimes contains large percentages of butter-fat, amounting in some instances to one-fifth of that produced by the farmer's cows.

Frank Swoboda, agricultural representative of the United States Department of Agriculture and the College of Agriculture of the University of Wisconsin for Langlade county, has found that many farmers in his section are losing money by running cream into the skimmed milk. His tests, made co-operatively with local creamery men, showed losses which warranted him in carrying on a campaign for the more efficient use of farm separators.

C. E. Lee of the University Dairy School, has assigned six causes for the loss of fat in milk: First, the separator may not be standing level upon a firm foundation; second, the bowl may be out of balance and vibrating too much when in operation; third, the bowl may not be operated at full speed (if the speed of the handle should be forty-eight or sixty, as is indicated by the book of instructions, it must be maintained at that rate during the separating, and, if other than hand power is used, the speed of the bowl must be the same; fourth, skimming milk that is too cold (milk should be separated immediately after each milking;) fifth, the cream outlet may be partially stopped, due to improper cleaning of the separator; sixth, the bowl may be too low or too high. If too low, it is due to the parts being partially worn, or in removing the bottom parts for cleaning and not readjusting the height of the bowl to its original position.

THE DAIRY SITUATION

The farmers of America have always had one problem to solve and that is the problem of greater fertility, or the maintenance of the life-giving elements in the soil. Today that same problem is facing them more than it has ever done in the past. When feeds were cheaper and labor plentiful a farmer could, perhaps, keep cows that did not yield an abundant porfit, without himself becoming bankrupt. Today he must get ample returns for every dollar that is invested in barns, equipment, feeds and breeding stock.

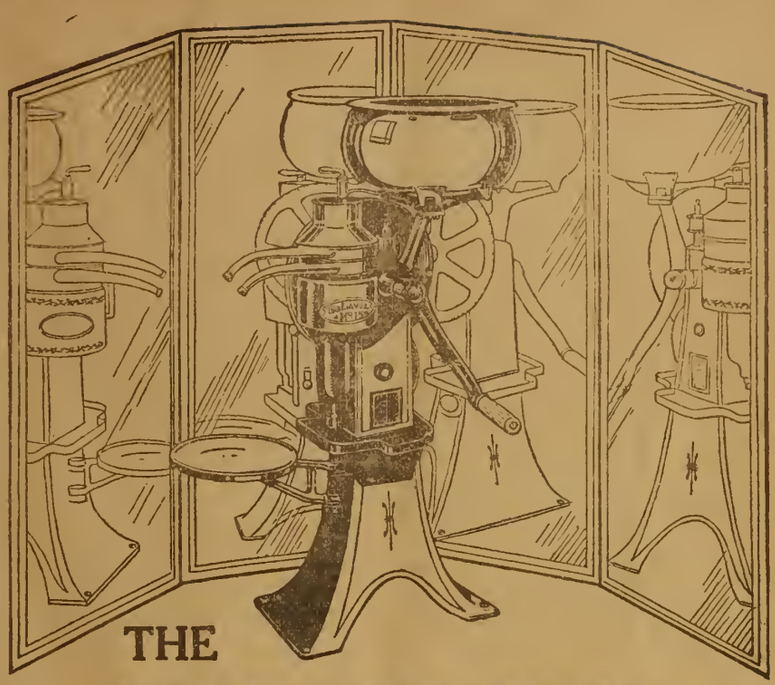
Ae fe wyears ago these investments were of a nominal figure. Today they run into such proportions that they almost force the man who would like to be a farmer to hesitate long and think seriously before he undertakes the step.

The man who is able to produce milk and butterfat at a profit in the fact of the conditions mentioned above must have nothing but the very best of dairy cattle. That means that the prospects for breeders of high class dairy stock were never brighter than they are right now.

We can no longer blind ourselves to the actua lconditions. Cost sheets must be kept even though they are ont as complex as the one that finds a place on the manufacturer's desk. The farmer, however, is a manufacturer and when he faces the situation squarely he will see that it is ncessary to know first of all what each cow is giving, then he will determine for himself which are the cows he must keep and finally he will replace the non-producers with those that make a profit every day. The man whh has such stock to sell is indeed fortunate. The future is bright for him.

BUTTER MAKING

The annual statement of the Pictou County Dairy Co., Ltd., in connection with the work at the Stellarton Creamery has been issued and the shareholders are to receive a dividend of 7 per cent. The concern did a largely increased business over the preceding year. No less than $41,233.94 was paid out to the farmers for cream and $1,705.90 for milk. The butter sales amounted to $43,466.87 and at the close of the year there was butter on hand worth $7,045.58. The other sales of product for the year were milk $2,080.55; buttermilk, $1,629.49; and sweet cream sales, $1,286.18.



THE NEW DE LAVAL CREAM SEPARATOR

Every Reflection Shows Perfection

VIEWED from every angle, the De Laval is distinctly in a class by itself. It has a business-like appearance. It looks as if it were well made, and it is. It looks sturdy, and it is. There is no make-believe about it anywhere, from the wide-spreading substantial base to the solid, seamless, symmetrical supply can.

It's no wonder that big dairymen and creamerymen who have for years made a careful study of dairy methods and machinery refuse to consider any other separator but the De Laval. They know that from every angle—clean skimming, ease of operation, freedom from repairs, durability—there is no other cream separator that can compare with the De Laval.

They know that it has a record of 40 years of service behind it. They know that it can be depended upon. They know that they can't afford to take chances with any other cream separator—

And neither can you.

Order your De Laval now and let it begin saving cream for you right away. Remember that a De Laval may be bought for cash or on such liberal terms as to save its own cost. See the local De Laval agent, or if you don't know him, write to the nearest De Laval office as below.

THE DE LAVAL COMPANY, Ltd.

LARGEST MANUFACTURERS OF DAIRY SUPPLIES IN CANADA.
Sole manufacturers in Canada of the famous De Laval Cream Separators and Ideal Green Feed Silos. Alpha Gas Engines, Alpha Churns and Butter-Workers. Catalogues of any of our lines mailed upon request.

LIVE STOCK.

CO-OPERATIVE MARKETING OF WOOL MEANS

1. That wool is graded according to quality and paid for on the same basis.

2. All the wool is accumulated at one or two central points where the grading is done.

3. The grading is done by experts from the Sheep and Goat Division, Department of Agriculture, Ottawa.

4. The wool is taken direct from the sheep. Tub washed wool is not accepted. Why Because the mills divide a fleece into parts acorcding to quality and length, each part is used for a certain purpose. They cannot separate the different parts when it is tub washed.

The Advantages to be Derived

1. A large amount of graded wool at one point attracts the attention of buyers from the yarge woolen mills.

2. Outside competition forces local buyers to pay a higher price.

3. The wool growers are not at the mercy of country peddlers. Co-operative marketing means the elimination of several middlemen.

4. Organixed selling considerably reduces the overhead expenses which have to be borne by the producer.

5. Marketing wool co-operatively results in beter wool being produced because price depends on grade. It also results in better care of the sheep.

6. The flat rate of so much per pound irrespective of quality will be displaced. The wool grower with clean, dry wool will receive a premium for his trouble.

Plans of the New Brunswick Department of Agriculture for the Marketing of the 1918 Wool Crop Co-operatively

1. Lectures will be delivered at the various Agricultural Societies, all the different phases of the subject will be discussed. Lectures will also bc delivered in sheep districts not served by Agricultural Societies, thus giving them oportunity to market their wool in the modern way.

2. The secretary of the Agricultural Society will be the medium through which all correspondence will be transacted.

3. Wool growers Associations will be formed in districts that are not served gy Agricultural Societies, providing five or more members can be secured and officers elected. The forms and regulations governing the formation of such a Club can be secured from the Provincial Department of Agriculture upon request.

4. Fredericton and Moncton will be the two grading centres for the Province.

5.All wool wil lbe weighed in at the grading stations on tested scales.

6. .Farmers selling wool co-operatively will be issued a cheque for about three-quarters of the value of the wool. The balance will be paid when the wool is sold.

Co-operative Wool Sales in Other Parts of Canada

1. The co-operative method of marketing wool is general throughout all the provinces of Canada except New Brunswick. In 1917 over 2,000,000 pounds of wool was marketed co-operatively in Canada. Nova Scotia farmers marketed 36.000 pounds; Prince Edward Island 24,000 pounds; Quebec 213.000 pounds; Ontario upwards of 400,000 pounds; Manitoba 200.000 pounds; Saskatchewan nearly 500.000 pounds; Alberta between 300,000 and 400,00 pounds.

2. Last year Prince Edward Island farmers sold 24,000 pounds of wool co-operatively at an average price of a little over 70 cents per pound.

3. Each year the amount of wool handled by the various co-operative wool associations throughout Canada has increased.

4. The enterprising farmers of the Sussex and Studholm district, of Kings County, N. B., have marketed their wool co-operatively for three years in succession. Last year the Sussex and Studholm Wool Growers Association marketed 4.000 pounds.

Care of the Sheep

1. Keep the sheep as clean as possible during the winter months. Feed hay, etc., in racks and do not allow litter to fall on sheep when feeding. Keep pens well bedded. Trim to prevent manure collecting on hind quarters.

2. The flock should be kept thrifty.

3. Protect from storms and draughts.

4. Shear in the spring before the new growth commences.

Preparation of the Wool

1. Shear on a clean floor. Clean wool means a higher grade. Watch for chaff, timothy heads, burrs, etc.

2. Shear the sheep when dry and keep the wol dry. Damp wool will mildew in storage.

3. Tub washed wool will not be accepted.

4. Tage, matted locks, etc., should be clipped from the fleece previous to shearing and packed separately. If ont, they will lower the grade.

5. After the fleece is sheared turn it over, turn in the sides of the fleece and roll from both ends until they meet in the centre. The clipped surface must be on the outside when the fleece iis roleld.

6.. Tie each fleece separately. Use paper twine for this purpose. (It will be supplied.) Do not use any other material for tying the fleece. Keep all black and grey fleeces separate.

2. The wool must be packed in sacks.)These will be supplied.)

8. To prevent trouble each sack of wool should be provided with two tags one inside and one outside, containing owners name and address. (These will be provided.)

Study this phamphlet carefully. If you haven't an Agricultural Society in your district, organixe a Wool Growers Association. Market your wool in a modern way. The members of an Agricultural Society or Wool Growers Association could well afford to co-operate and purchase a shearing machine.

CANADIAN CO-OPERATIVE WOOL GROWERS

There was a time when wool sold at a very few cents per pound; a time when sheep raising was not the profitable industry that it is today. The increase has been due, it is true owing to war conditions, yet in no small measure is this increase due to co-operative efforts on the part of the sheep raisers in selling their wool products. Four years ago co-operative wool selling actually commenced. A few sales, here and there , were held previously but the development was started in an organized fashion over the entire country four years ago. The Federal Depratment of Agriculture, through the Live Stock Branch, at that time commenced an active propaganda to encourage the sheep industry and place upon a more staple and permanent basis by an agency to spread information in respect to the improved preparation of the wool, supplying the serviecs of expert graders to classify the wool and doing its utmost to develop co-operative sales. The results obtained may be shown from the following figures. In 1914 about two hundred thousand pounds of wool was sold ci-operatively in

Supplying the Demand for Royal Purple Calf Meal

This baby food for young animals is partially pre-digested, and can be fed to the youngest animals with perfect safety. It WILL NOT cause stomach or bowel trouble, which are serious ailments in young animals. Royal Purple is a sure preventive for scouring.

Calves Gain Rapidly Without Milk

When the calves are 3 or 4 days old they can be fed Royal Purple Calf Meal and raised just as well without one drop of milk. What prominent breeders remark:

Mr. Geo. W. Collins, Plainfield. Ont , writes:

"Gentlemen,—In regard to your Calf Meal, I think you have the best on the market, as people who have bought it give it great praise. Some have taken their calves off sweet milk, and feed them nothing but your Calf Meal and water, and say they are doing as well on it as they did on the whole milk."

To Whom It May Concern: Uxbridge, Aug. 5th

This is to certify that I have secured your "Royal Purple" Calf Meal from our druggist. Mr. T. C. Nicholls, of Uxbridge, and can speak of this meal in the highest terms. I have used other calf meals, but this one is the best I ever tried. I never saw a calf gain more rapidly and thrive better than mine did while using your "Royal Purple" Calf Meal. I can cheerfully recommend it to all our stockmen who wish to raise large, healthy calves."—Stanley W. Croxall.

Note—The above Mr. Croxall keeps a large herd of pure-bred Holstein cattle, and is an excellent authority ou Calf Foods.

Royal Purple Calf Meal is equally good for young colts, lambs and young pigs. Put up in 25-lb., 50-lb. and 100-lb. bags. Secure it from our dealer in your town.

I KNOW A WOMAN'S SUFFERINGS

I am a woman.

What I have suffered is a far better guide than any MAN'S experience gained second-hand.

I know your need for sympathy and health.

And the treatment that gave me health and strength, new interest in life, I want to pass on to you, that you, too, may enjoy the priceless boon of health.

Are you unhappy, unfit for your duties? Write and tell me how you feel and I will send you ten days' FREE trial of a home treatment to meet your individual needs, together with references to women in Canada who have passed through your troubles and regained health; or you can secure this FREE treatment for your daughter, sister or mother.

If you suffer from pain in the head, back, or bowels, feeling of weight and dragging down sensations, falling or displacement of internal organs, bladder irritation with frequent urination, obstinate constipation or piles, pain in the sides regularly or irregularly, bloating, dyspepsia, extreme nervousness, depressed spirits, melancholy, desire to cry, fear of something evil about to happen, creeping feeling up the spine, palpitation, hot flashes, weariness, sallow complexion, with dark circles under the eyes, pain in the left breast or a general feeling that life is not worth living, I invite you to send to-day for my complete ten days' treatment entirely free and postpaid, to prove to yourself that these ailments can be easily and surely overcome at your own home, without the expense of hospital treatment, or the dangers of an operation. Women everywhere are escaping the surgeon's knife by knowing of my simple method of home treatment, and when you have been benefited, my sister, I shall only ask you to pass the good word along to some other sufferer. My home treatment is for all,—young or old.

Read My FREE Offer:

To Mothers of Daughters, I will explain a simple home treatment which speedily and effectually dispels green-sickness (chlorosis), irregularities, headaches and lassitude in young women, and restores them to plumpness and health. Tell me if you are worried about your daughter. Remember it costs you nothing to give my method of home treatment a complete ten days' trial, and if you wish to continue, it costs only a few cents a week to do so, and it does not interfere with one's daily work. Is health worth asking for? Write for the free treatment suited to your needs, and I will send it in plain wrapper by return mail. Cut out this offer, mark the places that tell your feelings, and return to me. Write and ask for the free treatment to-day, as you may not see this offer again. Address:

MRS. M. SUMMERS, Box 309 Windsor, Ontario

organized in every province and were attaining fairly successflu results by offering wool ofr public sale en bloc, after it wasg raded. Owing to the conditions of manufacture in Canada whereby this is centered in Eastern Canada and some classes of Canadian wool canot be utilized for manufacture in Canada many of the associations realized the necessity of creating a central selling agency or medium in order to insure the highest return for their wool and minimize the expense. At a meeting held in Toronto, February 5th, 6th and 7th which represented growers from every association in every province in Canada a co-operative company was organized for this purpose known as the Canadian Co-operative Wool Growers. It will have its head office in Toronto where a warehouse will be established and will make direct connection with Boston and Great Britain. The officers of the company are as fololws: President, Col. R. McEwan, London, Ont.; First Vice-President, James D. Wilson, Maple Creek, Sask.; Second Vice?President, Stanley Logan, Amherst, N. S.; Directors, Geo. C. Hayes, Kamloops, B. C.; J. W. Renton, Calgary, Alta.; Levi Harker, Magrath, Alta.; J. H. Follett, Duval, Sask.; J. D. Wilson, Maple Creek, Sask.; George Gordon, Oak Lake, Man.; Col. R. McEwen, London, Ont.; W. A. Dryden, Brooklin, Ont.; Geo. L. Telfer, Paris, Ont.; J.A. McClary, Lennoxville, Que.; J. R. McDowell, Shawville, Que.; M. St. Marie, Hoe's River, Que.; Angus M. Avard, Sackville, N. B.; Stanley Logan, Amherst, N. S.; Wm. McGregor, Central Lot 16, P. E. I.; Secty-Treas. G. E. O'Brien,, Toronto.

The company is very representative of all sheep raising districts in Canada Canada; in 1915 this amount was a little more than doubled; in 1916 a million and three quarter pounds were sold co-operatively and in 1917 over two million and a half pounds.

Associations for this purpose were and will be directed by men actively engaged in sheep raising and in present existing wool growers' associations. The organization represents a step in the right direction and will work in full for the benefits of the wool growers. Every grower in Canada who has not already sold co-operatively should connect himself with a loca lasociation and in that way he can assure himself a higher price than he could obtain through individual selling. By supporting the local association he supports the ntaional organization. It will mean the placing of the sheep industry in Canada on a higher and better plane.

SKIN DISEASES AND PARASITES MOST PROLIFIC SOURCE OF UNTHRIFTINESS AMONGST CATTLE

Skin diseases and parasites in cattle, while not directly dangerous to life are a most prolific source of unthriftiness amongst all cuasses of domestic animals and in no disease is an "ounce of prevention worth more than a pound of cure" than in that which controls and prevents the spread of contagious skin diseases, which are in almost allcases coused by parasiites.

One of the most common of these is blue lice. Their development is rather peculiar. Sometimes there will only be a few present for a considerable period, when suddenly they will break out in epedemic form and infest the whole herd. No herd or flock will thrive properly when they are infested with these pests and the only way to guard against them is to keep on the watch for their appearance and adopt prompt measures to eradicate them.

There are several remedies in the market which are more or less effectual such as tobacco, coal tar preparations, etc., but for ease of application, cheapness and effectiveness we have never used anything for cattle equal to common builders' cement and hellebore.

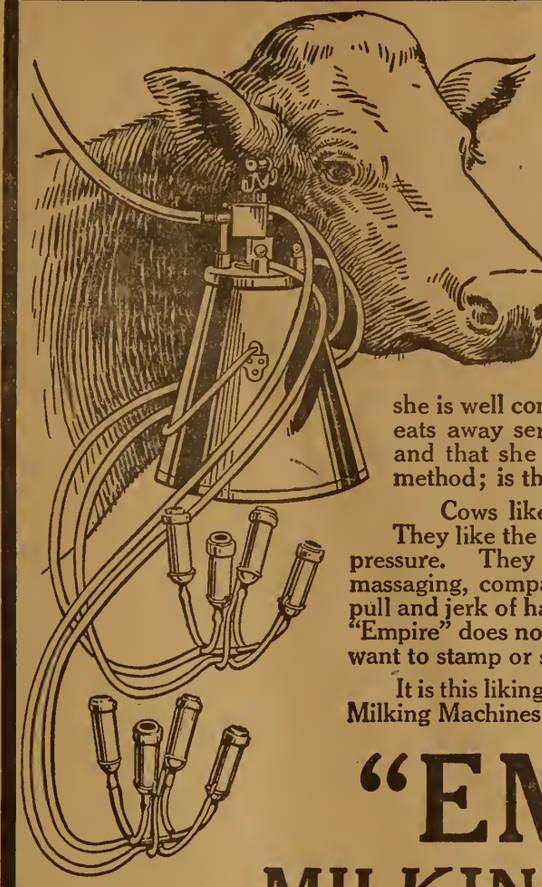
The way to use it is to mix thoroughly one part of helelbore with four parts of cement, by measure, and with an old pepper box or tin can, with a number of small holes punched in the lid, sift it on the animal from head to tail anlong the spine and on each side of it.

Previous to the application the hair should be cleaned so that the mixture will be readily worked down to the skin and over the body. In a week or ten days repeat the operation to catch the nits that will escape the first dose. Two applications are all that are usually necessary, but it will be advisable tokeep watch for some time or give a third application. The remedy is so cheap and easily applied that one should take no chances of any of the pests being missed. Indeed it will be a wise precatution to use this remedy every fall soon after the stock is put into winter quarters as a preventative against an outbreak.

Mange in Cattle

Mange in cattle is more common than most people suspect. It is caused by a germ or parasite working down into the skin and steting up the disease. An animal with it should be

(Continued on page 334)



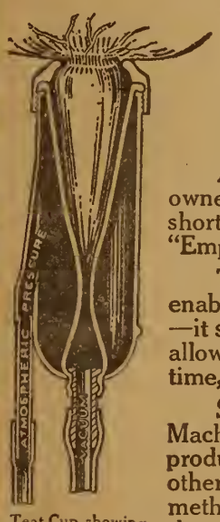
The Cow is the EMPIRE'S Best Salesman

THE cow can't tell you, in words, why she likes the "Empire" way of milking—why she prefers it even to the most careful hand milking. "Actions speak louder than words." The fact that she is well content to be milked with the "Empire;" that she eats away serenely as the "Empire" brings down the milk; and that she gives more milk than if milked by any other method; is the best proof that she likes the "Empire".

Cows like the way the "Empire" massages the teats. They like the smooth, even motion of the vacuum and air pressure. They like the steady regularity of "Empire" massaging, compared with suction, or the irregularity and the pull and jerk of hand milking. And, cows get to know that the "Empire" does not shout, or thump them on the side when they want to stamp or switch the tail.

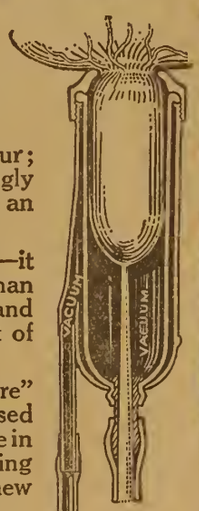
It is this liking—this contentment—that makes the "Empire" Milking Machines show such excellent results.

"EMPIRE" MILKING MACHINES



Teat Cup showing walls expanded.

are solving the hired help problem for thousands of farmers—reducing the cost of milk production—taking the drudgery out of dairying on hundreds of farms throughout Canada and United States,—why not on your farm?



An "Empire" Machine milks twenty to thirty cows in an hour; owners of smaller herds will finish their milking in a correspondingly shorter time. A ten or twelve year old boy or girl can operate an "Empire" Milking Machine without trouble.

The "Empire" is always on the job, and always ready—it enables the farmer to be practically independent of the hired man—it saves hours of valuable labor for other work each week—and allows him to handle a larger herd with a smaller investment of time, labor and energy.

Shrewd farmers and dairymen are installing "Empire" Machines, recognizing the need for, and profit in increased production of all farm produce. Shortage of labor and advance in other expenses makes economy and greater efficiency in operating methods necessary. You would install an "Empire" if you knew them as these farmers do.

We would like to send you our literature, without cost or obligation on your part. Send in the Coupon.

THE HORSE

WORKING THE BALKY HORSE

(By J. F. Cox of Arkansas)

The horse had balked in town, and the usual crowd had gathered with the usual suggestions. It has always been a mystery to me why men who probably never drove a horse 100 miles in their whole lives will "butt in" and undertake to tell the driver just what ought to be done when a horse refuses to pull.

A number of "sure cures" had been tried and had failed. One man tied a rope to the horse's fore foot and attempted to start him by pulling the foot forward. Some one across the street called him, and he turned to another man standing near watching the performance with, "Here, take this and pull him out."

"Excuse me," returned the gentleman addressed; "I drive with the lines." The man was a teamster; I knew him well. I had never seen him fail to make a puller of the balkiest horse in a few days. I had seen him start a balky team time and again by simply picking up the lines and speaking to them just as he would have spoken to any other team.

I have thought that the secret of his success is that he always spoke to a team just as if there was not the leat doubt in the world that they would move right off. Somehow when you heard his cheery "Get up, boys," you always expected to see them go—and they usually did. People said he "had a way" with horses.

"Too Many Cooks"

"Why didn't you take the lines and drive that horse out?" I asked him the next day.

"Too much help," he replied; "too many know-it -alls butting in. You couldn't expect to manage a nervous horse under such conditions. I never try to do anything with a balky team with a great crowd gathered amout. I would tie them up and leave them half a day first."

I asked him one day to tell me the best way to start a balky horse.

"There ain't any one best way," he said. "The plan that works with one horse often fails with another. A lot depends upon the disposition of the horse. More depends upon the driver and the way he handles the lines than upon any other one thing. In fact, if the lines are properly handled from the start the horse won't ever balk—at least not one in 100.

"There are very few 'naturally' balky horses. It is the most natural thing in the world for a horse to pull. Why, I've seen 'em that would just go wild, almost, if they thought the load was about to stick on a hill or in soft ground. It wasn't the result of training, either; it wasn't the nature of the animal—the natural disposition of the horse unspoiled by abuse and mismanagement.

Depends on Driver

"No, sir; if the lines are in the hands of a man who knows his business, who understands horses and love them, you needn't often worry about their balking. Of course," he went, on "there are some horses that will stop on a hill occasionally with the best drivers."

"Then what do you do?" I prompted.

"Well, in the first place, I try not to let them stop. If he shows signs of balking, a quick turn to the right or left will often make him forget it. Pull him square across the road, if there's hoom, then pull him straight agan, alwayis with a gentle, steady pull, of course, and with a low-spoken cheery word of encouragement.

"Watch him closely, and if you see that he is going to stop anyway, try to beat him to it by stopping him yourself. Even if he stops suddenly without warning, it is best to say 'Whoa,' and put on the brake, if you are on a hill, just as if you had intended for him to stop all along. Never let him know that he has balked or stalled. If he is young and nervous this knowledge will excite him; he is apt to become unmanageable, and such horses are easily spoiled. If he is a 'hardened sinner' this method will still be th ebest, for any effort to 'make' him go will arouse his ire and only strengthen his stubbornness.

Spare the Whip or Spoil the Horse

"Uuless you know that a horse is stopping through sheer laziness, never never hit him with the whip or yell at him to 'gidday.' If he is nervous this will cause him to jump up against the traces, the weight of the load throws him back, and if he does not 'stay back' the first time he will usually continue to jump, and unless you have a mighty steady old horse hitched with him, or unless the man with the lines understands his business thoroughly, it is only a question of how many wild leaps he will make against the load before he quits for good.

"When you have stopped the horse and quieted him with a friendly word, climb out and fuss with the harness a minute. Pull up the collar and rub his shoulders, readjust the bridle—a buckle may be chafing somewhere. The easing from any discomfort will put him in a better frame of mind, a kindly pat or two may cause him to forget that anything unusual has occurred.

"Climb into the seat again, throw off the brake, and speak to the horse quietly, cheerily, givinig him a slight pull to either side of the road. Nine times out of ten, unless the load is exceptionally heavy, he will start right on.

"If he fails to go, or if he stops again, repeat the performance. This time try cutting the wagon over and backing him a few steps, let him stand a minute, and pull him the other way in starting. This will allow him to move a few feet without feeling the weight of the load."

Whipping a Last Resort

"What do you think of such methods as cording the ears, tying the tail to the sinigletree, and blindfoling "

"Well, I'd use them as a last resort," he said. "But I prefer managing them with the lines. Of course anything out of the ordinary, anything that will divert the horse's mind will often do the work. I'd try anything before I'd give up or use the whip."

"But there are plenty of horses that have to be whipped, and there are some that take the whip all right?" I asked.

"There are a great many horses that may be whipped into pulling, and I used to think that there were a few that could be started in no other way, but I am not so sure of it now. The horse that has to be whipped is usually the one that has always been whipped; they learn to wait for it. And the trouble with whipping is that it takes just a little more of it each time.

"I have known horses that could be started quicker with the whip than any other way—I have started them that way—but I notice that if you start a horse by whipping him one day he is almost sure to balk again the next. If you once undertake to conquer a horse by whipping, you never know where it is going to end.

"On the whole, leaving out the cruelty of whipping, I have about come to the conclusion that it never pays. Kindness and patience are the two most important things, especially patience. Whatever you do, never get in a hurry, or get excited, or lose your temper. Just make up your mind to 'outlast' the horse. Never give up, never take a balky horse loose from the wagon until you have made him pull, though it may sometimes be necessary to throw off all or a part of the load."

PLENTY OF HORSE POWER NEEDED

Maximum crop production requires plenty of horses, men and efficient farm machinery. Powerful draft horses do more to compensate for labor shortage than any other factor. Gang plows of two 14-inch bottoms, with five powerful draft horses, will turn from five to 5½ acres per day; will disk on a 20-wheel disk harrow cuting nine feet in width in the field, from 14 to 18 acres per day; and on a 20-hole disk seed drill will seed from 18 to 20 acres per day, and cover it in the same operation.

Horses weighing over 1600 pounds, each in working condition are needed, and five of them to each farm teamster employed. Where such heavy draft horses are not available, smaller implements are used, and the daily turnover in work accomplished falls t oapproximately half that which is being done by men with heavy teams and plenty of them.—[Wayne Dinsmore.

WHEN HORSES ARE POISONED

When a horse, out at pasture or in the stall, is found staggering in a dopey condition with the pupils of the eyes dilated, it is usually apparent that he has eaten something that does not agree with him. The cause, of course, is not always the same. Bulletin No. 26, Scientfic Series, of the Health of Animals Branch, Department of Agriculture, Ottawa, that can be had free on application to the Publications Branch of the Department explains at least one cause of this state of things. The authors, Messrs. S. Hadwen D. V. Sc. Pathologist, and E. A. Bruce, V. S., Assistant Pathologist, tell of experiments by which it was found that bracken was frequently at fault. They say a disease known as "staggers" has been prevalent on the Pacific slope for many years, and then proceed to detail the results of their research. To show the serious nature of the complaint they quote an instance in which of 24 horses, owned by 11 farmers, 16 died. Not only are the symptoms fully set forth, but the treatment that should be followed is given and the steps that should be taken for the eradication of the fern from the horse's feed, when er gathered in the field or supplied from the hay loft. The title of the bulletin is "The poisoning of Horses by the Commen Bracken."

HORSE STILL A FACTOR IN WAR

There is some work in war as well as on the farm that can be done only by the horse. It has been found that the motor truck cannot supplant the horse entirely at the front. Motor trucks take the supplies from the railroads to the distributing points but from here horse power is used in bringing up the supplies to the cooking places and the trenches. By a special order of the Secretary of War certain men have been detailed to care for the animals so that now there is one veterinary officer and 16 men to each 400 animals in service. It is estimated that 10 per cent. of animals

on the average are incapacitated and require veterinary supervision. To care for the 400.000 animals which will be required in the service 1.000 veterinarians and 16,000 men ranking from sergeant down to private, will be needed. Veterinarians from recognized veterinary colleges were permitted to take examinations for the Veterinary Officers' Reserve Corps and if successful were commissioned with the rank of second lieutenant. The 16,000 helpers came from all waks of ife and many of them were unacquainted with horses. People who are the best acquainted with animals treat them with the most consideration. In the interest of efficiency in the veterinary corps, horsemen, horse dealers and farm boys, in the regular and the draft army, are constantly being transferred to the veterinary corps.

The Recognized Specific of Diseases of the Horse

A sovereign remedy in powder form which cures, Coughs, Heaves, Colic, etc. It strengthens the work horse as well as the race horse, and enables them to do more and better work. It has been successfully prescribed by many veterinarians notably by Dr. J. D. Duchene, in many critical cases, where results have proved remarkable.

A 50c box will be sufficient for six days' treatment.

EQUIP BARNS WITH AIRY BOX STALLS AND SO DRIVE DISEASE FROM THE STUD

No barn is considered fully equipped that has not got one or more box stalls. A few box stalls around the barn, fixed up to receive either cow, sow, or horse, is indispensable where the interests of live stock are seriously considered in order to give the best results, with profit to the farmer. Even the best management and skill will sometimes fail to keep a herd or stud free from some trouble, once in a while, that does not erquire an isolation stall for a sick animal. The brood mare, the sick horse, the young colt, gets more near the natural surroundings in the box stall, and the same applies to all the other breeds of live stock on the farm.

Ventilation

To have a healthy box stall it must be well lighted and well ventilated. Bad ventilation is one of the chief causes of pleurisy and pneumonia among horses. All animal life on the farm requires oxygen from the air to enable them to resist disease. Sunshine and light are the greatest natural destroyers of all disease germs and to keep them out of the barn or box stall is to court failure in keeping live stock healthy. In close and badly ventilated box stalls a sick animal is denied the weapon that nature gives to every wild or outside animal, namely pure air and light. An animal in a sick condition is always a prey to the lurking germ and when placed in a dark box stall the condition is intensified. **Many of the diseases that afflict horse flesh is due to impure blood, and that state of blood can only be got around the farm in the dark, badly ventilated barn or box stall.** Sunshine and the free use of the oxygen in the air are free to every farmer, and it is of the utmost necessity for the health of live stock that farmers accept nature's gift and arrange their barns and box stalls accordingly.

Ventilation does not mean drafts; it stands for comfort, not over warm. A warm barn is generally a damp one, nad in a box stall this condition must be guarded against. It may require considerable readjustment in some cases to fix up the barn with a few healthy box stalls for the brood mares or growing colts, but in every instance time and energy so spent will soon produce vis,bie results in the general tone of the animals.

Light is essential to the healthy eyesight of the horse. It is not readily recognized by farmers in general that horses are not unlike the human family in the matter of eyesight, and being dumb are unable to tell of the weakness. There is a growing tendency, while domestication proceeds with the horse, towards weaker eyesight, and the dark, damp confined stall is one of the mediums that tend to cause this coudition. A dark stall for perhaps a week or so on end during winter, then turned out to drive one whole day in the brilliant sunshine that bathes a snow-clad country, is extremely bad practice. Where the box stall or barn is well lighted there is no sudden shock to the eyesight, and the normal condition remains uncharged.

Most box stalls that are built have plenty of area in square feet, but they lack in cubic feet; they are built with the ceiling toolow. **It is the cubic air space that counts for health in the box stall.** For instace a box stall that is 12 by 12 feet and 6 feet high gives 864 cubic feet of air space. On the same area and 8 feet high will give 288 more cubic feet and will thus be all the more adapted to impart health to the occupant.

For large horses and especially for breeding mares, box stalls should be at least 12 feet square. For a horse exceeding 1,800 pounds in weight, a stall 14 feet square will be none too large, at least 14 feet from manger to rear wall, and in width from 10 to 12 feet. For convenience it will be better to have the stall facing the feed alley same as the other stalls, thereby greatly lessening the work of feeding, being able to put in hay and grain while the other animals in the stable are getting their share. The manger should be in the form of a long box with the top about 3 feet from the floor and the bottom about one foot above the ground. The bottom of the manger should be made with narrow spaces between boards, through which chaff and dirt can fall. The feed rack

(Continued on page 332)

Order Farm Machine Repairs Now Delay May Mean Loss

HAVE YOU thought of the difficulty you are going to have this year in getting repairs for your machines? It is the most important thing for you to be thinking about right now. Your crops may depend upon it.

You, no doubt, realize that all manufacturers are hard put to it to get materials; and the transportation facilities, freight and express, are congested to such an extent that shipments go through very slowly.

The implement manufacturer and agent in Canada realizes this today and the utmost is being done to take care of the farmers' requirements for repairs. Unless the farmers are also foresighted, many of them are likely to realize the difficulty too when the season for field work opens. They are going to be greatly handicapped if they wait until just before they are ready to use the machines before overhauling them and finding out what parts will have to be replaced.

We cannot urge you too strongly to get busy on this at once. Overhaul every machine on your place and see just what parts you need to put them in good working order, then place your order at once. This is the only way you can be sure of having the new parts in time for use.

We are making every possible effort to get ample stocks of repair parts to convenient points where you can get quick service. International Harvester branch houses are located in all parts of Canada and they always carry large stocks of repairs. Besides there are thousands of local agents who carry a good supply of the parts usually called for. Under normal conditions, you could expect quick action on repair orders sent to us or to any of our agents, but at this time conditions are not normal and it is a personal and patriotic duty to look ahead and plan ahead and be prepared to avoid confusion and crop-wasting delays.

Remember the first orders received are the first to be served, so you can recognize the importance of overhauling your machines now and seeing what you will need and getting your order placed. Better be ready than sorry. Do it now.

Two Extra Cans of Milk

Royal Purple Stock Specific will increase the daily flow of milk per cow, two to five pounds per day while in the stable. You simply mix this pure conditioner with the other meals you are feeding. Its action aids digestion, purifies the blood and improves the condition of stock.

Royal Purple Stock Specific

will put flesh on the poorest, most run-down animal on your farm. We stand back of this guarantee to the extent that we will refund your money if it does not give the desired results when directions are followed.

PUT ROYAL PURPLE STOCK SPECIFIC TO THESE TESTS: See if it will increase your milk flow. See if it will improve the condition of run down animals. See if it enables you to market pigs a month earlier. We know it does all these things. We ask you to try it—and benefit by its use. Sold by dealers everywhere in large and small packages.

POULTRY.

BUILDING UP A PROFITABLE POULTRY BUSINESS FROM A SMALL BEGINNING

By Mrs. George L. Russell.

I am a busy farm woman with the usual routine of farm work and children to care for, so I haven't had time, even if I had the ability, to work out the best feeding formulas. I am perfectly willing to take the advice of our experiment station and follow their method of feeding. I think we farm women should profit by their experience. I was also willing to take their advice when we wanted to build our poultry houses from time to time. Such houses are not an experiment but a success, for the poultry experts do not give out these ideas until they have tested them out and proven their worth. They also have given us very helpful information in selecting breeders that are of greatest benefit, and to all these suggestions I give credit for much of my success with poultry.

There is one part though, that I have found I could best work out for myself, and that is the marketing problem. For several years we followed the general practice of taking our eggs to the country store and receiving in exchange groceries and dry goods. We had no say as to what price we should receive—we took whatever price was offered. Our merchants in turn took whatever price the commission men offered them, and so on the eggs went from hand to hand, and they finally reached the consumer who paid much more for them than we, the producers, received.

I decided to try and find a better market for my eggs and wrote to several hotels, restaurants and hospitals in nearby cities telling them about the number of eggs I could furnish them each week, the quality, color, etc. I secured a market with very litle trouble, for such concerns are glad to find a place where they can obtain strictly fresh eggs of uniform color, size and quality. The first year I sold my eggs in this manner I cleared $125 more than if I had sold them on the home market. The only difference in trouble was, I saw to it that every egg I sent out was spotlessly clean. The eggs were taken to the express office instead of the store, and that was about all the difference in handling them. After June 1 I disposed of all my old male birds, so the eggs would be non-fertile, as such a trade demands this kind of eggs. What is the use of feeding old roosters all summer? That is, of course, if you intend to use new cockerels in the flock for another year. Any old male birds that were of especial value were put in a small yard and well cared for.

I followed this method of selling my eggs for several years. All this time I was trying to get a flock of Brown Leghorns. At first I owned one of the larger breeds, but I couldn't get the pullets to lay in fall and winter, so I purchased a pen of five Brown Leghorns and a rooster. From this pen I built my present flock of 500 hens. For a few years it was necessary to keep my Leghorns penned so they would not get mixed with the other breed, but as soon as I could I sold off everything on the place except the Brown Leghorns. I don't like to keep two breeds, for it is too much trouble, and when you can sell all the eggs and fowls raised at a good price, what is the use I haven't had any except the Leghorns now for over six years and find them a strictly business fowl.

Several years ago I became interested in selling eggs for hatching. I read of other folks doing it, and so I concluded to try it, as my flock was of good quality and good layers too. With much misgiving, but great determination I spent several dolars advertisinig eggs for hatching in the small papers in nearby towns and cities. It was interesting. I'll never forget the excitement I felt when the mail came. When an order came for eggs I was very careful in filling it promptly and carefully. I didn't get rich by any means with those small advs. but I was gaining in experience, and made considerable more than from my former method of selling eggs. The next year I advertised in some of the farm papers. The advs. run with the farm papers have proven much better than the same amount spent with papers in the litle towns. The farm papers are much cheaper considering their circulation. Then, no one but farmers or people interested in farms take these papers, and everyone that is interested in farming in any way is more or less interested in chickens. Now after several years of advertising we continue to use the farm papers, for they are the best advertising mediums. Each year I have spent a little more money advertising, and each year the profits have grown proportionally.

It is interesting work. You come to know so many different people throughout the United States, and feel that you have gained many friends. Nearly every mail brings letters from someone interested in chickens or some phase of chicken work, not always my especial breed, oh no, but we "chicken folk" are always willing to help with asked-for advice.

Any farm woman who owns a flock of pure-bred chickens can certainly increase her profit by advertising the egg as we have done. Or any farm woman can in a very few years own a flock of pure-bred chickens as I did, by making a start and working at it every year.

We have found it very convenient to send eggs to any part of the United States since they can be sent by parcel post, which reaches into every nook and post office. You would be surprised at the number of letters we receive saying "Please send my eggs by parcel post or return my money, for I live so very far from express office, and if sent by parcel post they wil lbe delivered at my door with the rest of my mail!"

Shipping Eggs by Parcel Post

We have found it best to advertise the eggs post paid. In this way the prospective customer knows what the eggs will cost delivered to him, and does not worry about what the charges might be and in the end perhaps not order at all. We use baskets to send our hatching eggs in, as they are so conveniently handled and the percentage of breakage is quite small. Parcel post eggs are handled just as carefully as eggs sent by express. They are not put in mail sacks as so many suppose.

Business Shows a Steady Increase

Our flock has grown from year to each year. The houses were paid for many, many times by the chickens before they were built. For 10 years we have been improving our poultry yards. Our poultry is only a part of our farm work, but we try to make it a very profitable part.

Really there is more money in poultry considering what you have invested in it, than any other branch of farming. I started 1916 with 365 Brown Leghorn hens. The cash sales from the flock were $1782,91. Of course there were expenses, the advertising, postage, etc., but I kept accurate record of those, and even charged their feed to them, and still

RAISE EVERY CHICK

More chickens this year than ever before. More for your table, more for market.

That's the demand. You need them to replace high-priced meats. The country needs them for the same purpose.

The opportunity to make money and save money with poultry was never so great as now. But you must make every chick from your high-priced eggs grow, and every ounce of your high-priced feed produce meat.

Certainty of success—of raising every chick that is right to marketable age quickly—is insured when you use the

STANDARD Colony Brooder

It stops the frightful losses so common to the brooder period. Makes three chicks grow where one grew before. Broods 100 to 1000 chicks with equal success, at a cost of less than 6 cents a day. Burns hard or soft coal. Fire lasts 24 hours from one filling. Cuts installation and operating cost to less than half—labor cost to less than a fourth.

Absolutely safe and sanitary. Nothing to catch fire; no corners where chicks may be crushed; no wooden walls or curtains to harbor vermin and dirt. Complete ventilation without drafts. Nothing to it but a smooth, solid cast iron stove, a clean galvanized steel hover, and the regulating apparatus. Nothing to wear out. Positively self-feeding and self-regulating.

It is so good that it has many imitations. But our patents will be protected. Make sure you get the Standard. We are so certain that it is the best brooder ever built, so sure it will satisfy, that we let you

Write Your Own Guarantee

What do you want a brooder to do for you? Write it down. We'll sign it. And if the Standard does not fulfill your guarantee in every particular we will return your money without argument.

The Standard is endorsed by all agricultural colleges and experiment stations. Among more than 30,000 enthusiastic users, big and little, not one failure has ever been reported.

Over 6000 dealers sell it. The one nearest you will be glad to show you the Standard in operation.

Write for the Buckeye Catalog and get the most wonderful testimonials of chick raising success you ever read. A post card request will bring it.

BISHOPRIC AND THE FARMER

BISHOPRIC products mean more than sound, substantial, durable buildings. They mean building material that you can handle yourself at a saving of from 25% to 50% over sheathing, lumber, metal lath, and lath and plaster—and give you a warmer, drier and better building.

BISHOPRIC STUCCO BOARD

is the cheapest and best background for stucco for outside walls, and for plaster for inside walls.
The thick layer of asphalt mastic prevents dampness; the stucco or plaster is held by the dove-tailed lath, while the sized sulphide fibre board holds the material firmly together, and is a non-conductor of heat and cold.
For interior work, when plaster is not desired

BISHOPRIC STUCCO BOARD

should be used, applied with the lath to the studding and the sized fibre board ready for any class of decoration, exposed.
It is easily and quickly applied without creating muss and dirt, saving lath and plaster, and about 50% of the labor cost.
If you are building or intend to remodel the house or barn, write us for descriptive and illustrated booklets, telling in detail the facts about Bishopric products. 87

year, and as it has grown, new houses have been added. Small houses are used for raising the chicks and for especial breeding pens. These houses were formerly occupied by the laying hens, but three years ago we built a long laying house. Only a little money has been spent for equipment had a clear profit of over $1000 left. I also increased my flock to 500 hens. In 1917 total sales amounted to $2.-142.67, feed cost $802.75, advertising $179.23, postage and expressage $110.23, leaving profit of $1050.44.

USE STANDARD POULTRY

Standard poultry, as the phrase is commonly used in America, is poultry bred to the stndards established by the American Poultry Association.

The object of making standards for poultry is the same as the object of making standards of weight, volume or quality for any product or commodity—i. e., to secure uniformity and establish a series of grades as a basis of trading in the articile.

In makinig standards for poultry which apply in the process of production the principal points considered are size, shape and color.

Breed Characters

Size and shape are breed characters and largely determine the practical values of poultry. Many standard breeds are divided into varieties differing in color, but identical in every other respect.

Color is not a primary utility point, but as a sec ndary point often comes in for special consideration. For example, a white variety and a black variety of the same breed are actually identical in table quality, but because black birds do not dress for the market as clean and nice looking as white ones, it often happens that they are not as salable.

When a flock of fowls is kept for egg production only, uniformity in color is much less important than type, yet the more attractive appearance of a flock of birds of the same color justifies selection for color as far as it can be followed without sacrificing any material point.

When a poultrykeeper grows his own stock year after year, he ought by all means use stock of a well established popular standard breed. By so doing and by selecting as breeders only as many of the best specimens of the flock as are needed to produce the chickens reared each year, a poultrykeeper maintains in his flock a hiighly desirable uniformity of excellence in every practical quality; with litle extra care and no extra cost can have a pleasant uniformity in color.

Each Breed Has Its Place

To the novice in poultrykeeping, it often appears that there is no real necessity for so many breeds and varities as have been standardized in America. Further acquaintance with them however, shows that although color differences are in most cases made merely to please the eyes of persons having different preferences for color, the differences in shape and size which make breed character have been developed with a view to adapting each to particular uses or particular conditions.

Leaving out of consideration the breeds kept as novelties, the most of which originated before industrial progress created a large demand for poultry products, all the standard American breeds of fowls have been made and developed on the general principle of practical quality, the foundation of breed character and value.

Classification of Useful Breeds

In harmony with this principal, the common classification of breeds according to their place in the general scheme of poultry production divides them into three principal classes—namely, laying breeds, meat breeds, and general purpose-breeds, that is, breds that are not a ready an persistent egg producers as the laying breeds, and not as meaty and as easy to fatten as the meat breeds, yet combine in one individual fowl very good laying capacity, with very good table quality.

The Leghorn, Minorca, Andalusian, Ancona- and Campiine are well known breeds of the laying class; the Brahma Dorking and Cornish of the meat class; the Plmouth Rock, Wyandotte, R. I. Red and Orpington of the general purpose class.

Characteristics of Egg Breeds

The breeds mentioned as of the laying class, with the exception of the Minorca, are relatively small, very energetic and lively, mature early and are easily kept in good laying condition. The Minorca is of a larger size and modified somewhat in th eother particulars mentioned, yet has more the character of the laying class than of any other.

Characteristics of Meat Beeds

In the meat breeds, there is not the same uniformity of type that is found in the laying breeds. The three mentioned are all quite different. The Brahma is most popular because it is at the smae time the largest and the most rugged in sonstitution. The Dorking excels in quality of meat, but is generally considered somewhat lacking in hardiness. The Cornish is rather hard-meated, but being very short feathered, hits its special place as a large meat-producing fowl in southerly sections where the more heavily feathered Brahma does not stand the summers well.

(Continued from page 330)

Big Egg Yield

Royal Purple Poultry Specific is a great egg producer and poultry conditioner. It makes hens lay in the winter almost as well as they do in summer. This is because our Poultry Specific supplies the missing food elements that fowl need in their winter ration and without which they cannot lay. Royal Purple Poultry Specific tones up the digestive system, and keeps the fowl active and healthy. It should be fed daily in a hot or cold mash.

Royal Purple Poultry Specific

has pleased thousands of farmers and poultrymen. It has enabled them to get winter eggs without trouble. Read the views of the following users:

Fred E. Bond, Kincardine, Ont., writes:
"I have been feeding Royal Purple Poultry Specific to my hens this winter and I find it beats anything I have ever used as an egg producer. They started to lay right away and kept on gaining. I will never feed anything else as long as I can get it."

T. W. Hale, Toronto Annex, writes:
"I have fed your Specific to poultry, and it is a valuable tonic; increases the production of eggs. Would not be without it; keeps them in good health and I recommend it highly. Any person trying it once will not be without it."

If you want more eggs and healthier fowl, feed Royal Purple Poultry Specific. It is sold in large and small packages.
Ask our dealer in your town for it.

INTERNATIONAL
POULTRY FOOD TONIC

International Poultry Food Tonic is a highly beneficial preparation containing finely ground roots, spices, herbs, & seeds. It provides just the right tonics to make your hens lay, its use often doubles the production of eggs.

International Poultry Food Tonic by toning up the dormant egg-producing organs will make your hens lay more eggs and further make them capable of standing the strain of such heavy laying.

International Poultry Food Tonic is sold by all dealers in 25c, 50c, & $1.00 packages on a spot cash, money back guarantee. The cost is trifling, will pay for itself many times over. Write to-day for a copy of International Poultry Guide—FREE.

FOR HOME AND COUNTRY

This Department will be utilized to the best interests of the homes in the Maritime Provinces. Subjects relating to household science and all that stands for better homes and communities will be published on this page. The editors, Misses Saunders and Winter, of Fredericton, N. B., solicite your assistance in making this page a success and will be glad to publish tested recipes, household discoveries and other articles useful to the homemaker and women's organizations.

WHEN I WAS A BOY ON THE FARM

The Late Jos. Wing Was One of the Greatest American Writers. This Is One of His Short Stories Written Just Before His Death.

Folks say these are better times than the old ones were, but I guess that they either did ot live in the olden times or they have forgotten a lot. Why, when I was a boy folks did not worry about things as they do now. My mother, who was a little woman and nowadays would be called "delicate" and have to have a "specialist" and like as not a trained nurse, had four boys to look after. She made our little trousers of that awfully good all-wool cloth (the cloth was made within half a mile of us, in a little country mill) and those little trousers wore all winter, I tell you, and maybe for two years. I wonder if that is not one secret of why women are so in a hurry these days, that they use flimsy materials in making goods.

Mother was never in a hurry, and never worried. How she did sing as she worked! And it was work, too, do not doubt that. Father kept a lot of old-fashioned cows that just melted and filled all the pails and then ran over a lot of foam, and mother set the milk in pans, in the cellar in summer and in the pantry in winter, and these she skimmed off the thick, yellow cream. What delicious cream that was. I used to steal it sometimes with a guilty finger, swooping it up from around the edge of the pan where it was thickest and sweetest. So mother made butter, immense solid rolls of yellow butter, and never a hint of butter color to be used those days, either.

And then there was the calves to be fed and the milk to be warmed for them on the kitchen stove. It seems to me that was a little rough for we used to spill it now and then as we took it off, and that must have made more work for mother to clean up, but she never complained.

Mother sang as she worked, and at night when her tired little boys wished a very luxury of going to sleep we would lay our heada in her lap and have her sing again to us. There was the song of "Pharaoh's Daughter." I wonder if any of you remember that song, how—

"Just before it was dark
They opened the ark
And found little Moses lay there."

I would give a milion dollars, if I had it loose, to lay my head in my mother's lap again and hear her sing that as she used to sing it, and to be as care-free as I was then! Well, there were other fine old songs and ballads. I wonder if any of you ever heard of the time "When the wind swept across the wild moor." That was a good creepy song to sing on winter nights when the wind whistled through the key holes. You know it goes this way:

"Oh father, dear father, she cried,
Come down and open the door,
Or the babe in my arms will sicken and die,
As the wild wind sweeps across the wild moor."

Just think! The cruel old heathen never listened at all, but buried his horrid old head in the covers and let the beautiful daughter die there in the storm, on his very doorstep, though I hope the baby did not free·e but was all right in her poor frozen arms next morning. I am not so sure about that.

Mother knew a lot of songs, and was a wonderful woman. Father was like the rest of us—pretty countryfied, and wore great cowhide boots and had calloused hands (nice warm, hands though to grasp our little hands and take us with him over the farm on cold days), and he could not sing, but mother had been a lady in her time and gone to boarding school and had learned to draw wonderful pictures of houses with wide overhanging roofs and bay windows upstairs and willow trees and water wheels and nice rosy boys and girls with curls and nice clean frocks on them. I used to wonder sometimes why she married a big rough man like my father, and yet sometimes when he had his Sunday clothes on he was handsome, and he used to take her then on his knee and she would snuggle down like a little child and her bright eyes would peep out roguishly to us from under his long beard. So I guess she loved him if he was big and rough, only I used to think that mother should have married a poet or an artist to have had her real mate, but no doubt she knew best.

I remember my first Christmas in our new home. What a happy one it was! It was in the good year of 1866 when I was five years old. Father had a mortgage on the farm to pay and mother never dreamed of going to the store for gifts, any way; they must come from her own hands. So she made some of her awfully good sugar cookies and cut them out in all sorts of shapes of little animals and men and boys, and she made me a little yarn ball (you ravelled out old socks wollen socks, and wound the ball, then covered it with bright colored Morocco leather). And I think I had a new knife from father, and I know I had a little book that she had made and bound, all herself, from plain white paper, and on each leaf a picture that she had drawn and a little writing or perhaps it was printed. How she loved to do such things, sitting up by the light of a tallow candle after we were all gone to bed, and working patiently at them. Ah, it was indeed a happy Christmas that year!

But I menant to tell of what women did in those days that they have forgotten to do now. Our old orchard used to load itself with apples then, more than it does now several times over. There was the great Pennock tree, with immense red apples, rich and juicy. There were the black apples and the Toppehockens and the Rambos and the fall pippins. They used to be wagon loads of big yellow apples and father would have me help pick them carefully, then mother would pare them (I used to love to eat her quarters, and she had usually a nice soft one for me), and then she would string them up to dry. I think we had a frame that was set in front of the open fire where they dried. Bushels of dried apples we had every winter, for there were not so many glass jars those days as there are now and no one dreamed of going to the "store" for fruit when his own was gone, so we did not let it waste.

Then she boiled sweet cider and made apple butter. Do you know, I never knew till this very year that there were people too ignorant to know how apple butter is made? Why, I supposed that every good citizen was raised, as I was, on bread and apple butter in the winter time. Well, ,you get good, sweet cider, not made of rotten appels (and I would love to tell you about the cider-making too, and how delicious it is to suck through a straw as it runs from the press, ,anad the yellow jackets up hungry kids! And awfully wholesome for them, that dispute with you the right of sipping it) and you boil that cider a good deal and it must not scorch either.

The best way is to have a brass kettle that holds about 30 gallons and have it outdoors, near the chip pile. Then you pare and core all the day before, and the men folk and sometimes the neighbors help you. You ought to have about ten bushels of apples pared and cored, as near as I can remember. Then early in the morning you start a fire under the kettle and putting the apples in you begin to stir the apple butter wiht a long-handled stirrer shaped like a big hoe, only the hoe part reaches clear to the bottom and scrapes the sauce off so that it wil! not burn or scorch and taste smoky. All day you must stand there and stir, and you ought to wear an old sun bonnet. The real old ladies sometimes smoked short clay pipes. Some way it seems the natural thing to do, but I do not advise the inexperienced young ladies to try it, not all at once anyway! Nor do I advise them to try to make apple butter in the real old-fashioned way!

Women of the olden time would peel a bushel of apples and think no more of it than the modern girls do of peeling a quart, and the ladies of the olden times had less backache and less heartache and less tribulation over making a half barrel of apple butter out by the chip pile than the young housewife has over making h half dozen glasses of jelly. Why is it? Blest if I know. I gues it is because there is now more fear of what Mrs. So-and-So would think if the jelly was spoiled. We live differently; we do not work so hard, but we work in a nerve-destroying way more than our mothers did.

But what was the apple butter for? Why, bless you, it for spreading on bread, and for hungry boys and girls! Licking good it is, thick and purplish or nearly black, pretty strong, having a lot of taste of the orchard boiled down. You can taste a whole summer's delights in a single spoonful of apple butter, and sometimes there is the hint of fall too, the smoke of Indian summer, and you can even tell what sort of chips the fire was made of that cooked the stuff. But how it did fill too. That is how our fathers paid off their mortgages. Half the country was in woods and half the rest was in wet pastures. Crops sold cheap, too, except right after the war, but the women folk never dreamed of asking for a cent of money and all that we had to buy from the store was salt and short sweetening for time of company; long sweetening (or sorghum molasses or maple) was plenty good enough fro us boys, and father took his own wheat and corn to the mill and we ate hundreds of bushels of corn made into mush and Johhn cake.

That little mother of mine raised chickens and turkeys and Shorthorn calves and made her flower garden. Father always attended to the vegetable garden, and she cleaned house mightily once every year and wove

Black as Dirt About the Eyes

Liver Was All Upset and There Was Pain Under the Shoulder-blade—Two Interesting Letters.

So many people suffer from derangements of the liver that we feel sure these two reports, just recently receivied, will prove interesting reading and valuable information to many readers of this paper.

Mrs. F. L. Harris, Keatley P. O., Sask., writes: "I was suffering from liver trouble—had a heavy pain under one shoulder blade all the tiime, and was nearly as black as dirt around the eyes, so I concluded to try some of Dr. Chase's Kidney-Liver Pills. I did so, and before I had taken one 25c. box the pain had left me and I commenced to gain in flesh, and by the time I had taken two boxes I was completely cured and felt like a new person. My trouble was caused by heavy work out-of-doors and, of course, heavy eating and constipation. I would advise anyone suffering from kidney or liver trouble to giive Dr. Chase's Pills a trial."

Mrs. Charles Terry, Tweed, Ont., writes: "Before I was married I was troubled with enlargement of the liver. My liver became so enlarged that you could detect the swellings on either side, and it was only with difficulty that I could get my clothes on. A friend advised me to get Dr. Chase's Kidney-Liver Pills and take them. I commenced this treatment, and used nine boxes, which cured me at that time. Then, about two or three years afterwards I was troubled again with the swelling but only on the right side. I secured some more Kidney-Liver Pills, and took them, which finally cured me. I have not been troubled in this way since. I can cheerfully recommend Dr. Chase's Kidney-Liver Pills to anyone having kidney or liver trouble.

"We have also found Dr. Chase's Linseed and Turpentine excellent for coughs and colds. In fact, any of Dr. Chase's medicines which we have used have been good.

Dr. Chase's Kidney-Liver Pills, one pill a dose, 25c a box, 5 for $1.00, at all dealers, or Edmanson Bates & Co., Limited, Toronto.

Severe Headaches

CAUSED BY

SLUGGISH LIVER.

When the liver becomes sluggish and inactive the bowels become constipated, the tongue becomes coated, the breath bad, the stomach foul and then ensues headaches, heartburn, floating specks before the eyes, water brash, biliousness and all kinds of liver troubles.

Milburn's Laxa-Liver Pills will stimulate the sluggish liver, clean the foul-coated tongue, sweeten the sour stomach, and banish the disagreeable headaches.

Mrs. A. Shublery, Halifax, N.S., writes:—"I take pleasure in writing you concerning the great value I have received by using Milburn's Laxa-Liver Pills for a sluggish liver.

When my liver got bad I would have severe headaches, but after using a couple of vials of your pills, I have not been bothered any more."

Milburn's Laxa-Liver Pills are 25c. a vial at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

husk mates and sewed carpet rags and walked to church, a mile and a half, and sang to her four boys and her one daughter and read good books and the one newspaper and lived with her soul up in th eclouds or the heavens anyhow, and believed in her boys and never was afraid that we would fall out of trees or fall into bad company. And someone who looks after mothers and boys made her faith come true, pretty near.

Yes, they were good old times, and right willing would I be to go back to them, for a time at least, though I might find the copper-toed boots rather cold on my feet, and might think that upper bedroom pretty draughty on zero nights, but after all I sleep now with my window up, or else clear out of doors, so I think I could endure that. But to get back, to see the women folk as happy as they once were, to see them again making apple butter in their back yards, singing as they worked, to smell the mushpot on the stove, to hear the slow bubbles burst from its yellow surface, to see the slow stream of golden sorghum as it poured from the glass syrup pitcher to a pile of yellow corn cakes, to see my little skates hanging against the wall and my cap (mother made it) and my mittens (mother knitted them and has darned them again and again)—how it would warm my blood and make my heart grateful and glad again!

There is a Message in This Lady's Story

SHE TELLS WHAT DODD'S KIDNEY PILLS DO FOR WOMEN

She Was Troubled With Weakness and Her Daughter Had Nervous Trouble. Dodd'sKidney Pills Proved the Remedy They Both Needed.

Hamilton, ,Ont., Mar. 4th. (Special)—The story told by Mrs. H. Dickens, of 70 Tom Street, t,his city, carries a message of hope to every suffering woman in Canada.

"After my baby was born." Mrs. Dickens states, "I used to suffer with my back and had no heart to do my work around the home. But I read about Dodd's Kidney Pills and what hey have done for others, so I thought I would get a box and see what they would do for me.

"I am pleased to say that after taking two boxes I found such great relief I would not be without them in the house.

"My daughter, too, had been very sick on and off for a long time. Her nerves got so bad we were afraid we would see her in the hospital. But I am pleased to say she is better through taking Dodd's Kidney Pills.

"I never thought Dodd's Kidney Pills could have done such good work and I am telling all my friends about them."

Women's troubles, or nearly all of them, come from sick kidneys. The cure for them is the old established remedy for sick kidneys, Dodd's Kidney Pills.

ARE YOU EATING ENOUGH VITAMINES?

Vitamine is defined as one of a class of substances of unknown composition existing in minute quantities in natural foods and necessary to normal nutrition, absence of which from diet results in deficiency diseases such as beriberi, scurvy and rickets.

For a long time it was known that beriberi was associated with too exclusive a ration of polished rice and some of us will remember that in our youth we were taught that scurvy among the sailors was caused from eating too much salt pork, or at least from an unbalanced ration.

We are now speculating as to the possible nutritional disturbance that may result from eating canned goods that have been heated to the point where the vitamines have been destroyed; from eating potatoes and apples that have been peeled, oatmeal., and milk that has been pastruized. Respecting the pasteurization of milk the uestion is an important one and should be further inivestigated, since milk constitutes the most iportant diet in children. Bruce Macallum, of London, conducted a series of experiments and makes the following statement: "The generally approved method of heating the milk 145 degrees F. and holding for 30 minutes, does not esriously affect the vitamine content."

Living, as we do, largely upon artificially prepared foods th esubject is search is replete with posibilities.—Geo. H. Clover, Colorado Agricultural College, Fort Colins, Colorado.

THE TEMPORARY REPAIR OF A SPECTACLE LENS

Those who are so unfortunate as to have to wear glasses know what inconvenience and discomfort are caused by breaking a lens and having to wait for a new one. Matters are helped some if a repair can be effected. This is not always possible but if the break is a simple fracture, the following method produces a good repair:

Soften gum shellac in alcohol and apply it to the edges to be cemented. Press the edges firmly together and hold in positiion for a few minutes. Then lay the lens on a pad of cotton or soft cloth for an hour or two, so that the shellac may harden enough to stand usage. Note that the shellac is not to be dissived in the alcohol —just soften until it can be spread on the edges of the glass.—L. S. Foltz, Colorado Agricultural College.

HOME SOLUTION MAKES PASTEURIZED CREAM WHIP

People who use pasteurized cream often have trouble in getting their cream to whip. This is due to the substance called viscogen, being destroyed by heating. This trouble can aesiliy be remedied by adding a cmall amount of homemade viscogen, which can be prepared as follows:

First, dissolve 2½ parts sugar in 5 parts water.

Second, dissolve 1 part of quicklime in 3 parts watetr.

Mix the two solutions and let stand a few hours. Siphon off, or pour off, the clear liquid, and what is left is an excellent substitute for viscogen, which, with proper care will keep for a long time. Use about a teaspoonful for a pint of cream.—W. F. D.

Endurance!
Aerial warfare is playing a most important role in this world war. Without our Aviators the artillery would be blind and useless.
COWAN'S
COCOA

Those who have to endure intense and nerve racking duties need to be primed up and fortified for the occasion. There must be no clog in the smooth running machinery of the human body. Eyes must be clear, brain quick and body normal. In order to meet these necessities proper care must be given to diet. Food must be consumed that is rich in Carbo-Hydrates, Proteins and Fats. COCOA—when mixed with milk is the ideal food drink to meet these requirements. It is a safe and sensible way to nourish the human body, for all times when quickness, accuracy and endurance are expected and when indecision spells defeat. For the best and surest results be sure you get

Croup

"Granny" Chamberlain

"I don't think there is a more anxious time for parents than when their children have croup. Without they are prepared with Chamberlain's Cough Remedy they must wait for the doctor and listen to the choking, metallic cough and watch their little one gasping for breath.

You know the great danger of croup is the formation of a false membrane in the larynx, and until this is expelled relief cannot be obtained, and the spasmodic choking continues. Give Chamberlain's Cough Remedy in frequent doses. It will loosen this membrane and cause the child to expel it by vomiting.

Chamberlain's Cough Remedy

is an absolutely safe and certain remedy for croup, and if given as soon as the child becomes hoarse, or even after the croupy cough appears, it will prevent the attack."

Yours for Health—Granny Chamberlain

TUBERCULOUS GLANDS

The old name for this condition was "scrofula" and we heard much about "scrofulous children," as if they were a certain type, like "towheads" or brunettes. Now we know that what we called scrofula is one form of tuberculosis, the most common form in children and youth, and probably the least dangerous of any of the tuberculoous infections, this in the sense that it rarely causes death directly, although it pulls down the body etrength until other diseases find easy lodgment in the weakened child.

It is caused by the same germ that causes Pott's disease, consumption and all the other forms of tuberculosis, the tubercle bacillus, but the form being common and seldom fatal, is treated with an indifferenee that is neither wise nor safe. Negroes are more subject to it than whites, but all delicate and run-down children are liable to be victims. "Puny" children, "spindling" children almcst always have little nodules under the jaw or near the ears. The lymph glands in those localities are part of the great lymphatic system which extends over all the body, just as do the nerves and arteries, but concerning which people know very much less. There are groups of glands in various places, like the groin, under the arms and in the neck, and this form of tuberculosis, while it may infect all the glands, appears first in the group in the neck. First the glands swell a little and become like kernels that may be rolled around under the finger. At the beginning they may not be sensitive at all, but if the disease progresses they will become so. They will also grow larger, and they may enlarge until they grow together in one mass. If this happens, the skin may become adherent and latetr may berak open and the pus in the glands discharge. In such a case the skin will be very long in healing and will leave a bad scar. In severe cases there may be general fever, and there is always a great drain on the child's vitality which hinders its development in body and makes it backward in school, besides keeping it in a likely condition to have any other disease that happens around.

Tuberculosis glands are apt to make their first appearance in the late winter or early spring. The reason is evident. vEeryone, young and old alike, is then at the lowest part of the year's well-being, worn down by the rigors of the winter and its indoor life, and often weakened by winter colds and coughs, and all diseases find easier foothold at this season. There are special reasons why some diseases like typhoid fever, for instance, are more prevalent at other seasons, but those reasons are found outside the body.

There are two methods of treatment the expectant and the radical. The expectant method is to try to build up the child's general condition, "expecting" a cure. This treatment calls for outdoor air—by the sea, if circumstances permit—a diet of milk, eggs and other nourishing foods, and freedom from all confining work or study so far as possible. Cod liver oil is a popular adjunct, and I dare say it often helps. This method is slow at the best and it should never be relied on if the glands are increasing in size in spite of it.

The radical method is to take the glands out. The operation is not a serious one, not nearlyas dangerous as to leave the glands in, with the risk that possibly infectoin may be carried to other parts of the body. Naturallly parents dread any kind of a surgical opeartion for their children, but the question is a choice of evils, and a tuberculous gland is much safer outside a child's body than in it.

If the patient is a girl the scar of the wound is always dreaded. Most surgeons consider this esthetic side, and make as small an incision as posible. This is one reason for an early operation, because if the infetion is slight, a short incision will suffice, but if many glands are involved and are matted together, it requires a long cut through which to work. I remember one very bad case in a girl of twelve where both sides were diseased and the cut reached literally from ear to ear, with the exception of a short strip under the chin. Fortunately such cases are rare, and they never need occur if proper care is taken. Another advantage in the operative method is that the clean cut heals in a straight line with only a slight scar, whereas if the skin breaks down of itself and the pus discharges through it, the scar is jagged and much more disfiguring.

After the operation is over and the wound is healed, the child should be given just the same building-up care that was outlined for the expectant treatment. This should be continued until the child is hale and hearty. People sometimes ask if the glands will "return"; of course the glands that are taken out will not come back again, but the glands that are left may become infected the same as the first ones were if the same conditions continue, and it is to guard against this that the after-treatment is given.

Fashions Dept.

How to Order Patterns.

Order by number, giving age or measurement as required, and allowing at least ten days to receive pattern. Also state in which issue pattern appeared. If two numbers appear for the one suit, one for coat, the other for skirt, thirty cents must be sent. Address Fashion Department, "The Maritime Farmer, Sussex, N. B. Be sure to sign your name when ordering patterns. Many forget to do this.

Positively no patterns will be sold under 15 cents each, owing to advance in cost of same.

When ordering, please use this form:—

Send the following pattern to:

Name .....

Post Office.....

County .....

Province .....

Number of Pattern.....

Age (if child or misses' pattern).....

Measurement—Waist .....Bust.....

Date of issue in which pattern appeared. .....

SOME POTATO RECIPES

By Mrs. W. C. Palmer

To obtain the highest food value in potatoes they should be either boiled or baked in their skins. When potatoes are pared before cooking, the least loss iss sustained by putting them directly into boiling water. Do not allow pared potatoes to stand in cold water before boiling, as it has been found that this results in a loss of nutrients.

It takes from 20 to 30 minutes to boil potatoes and about an hour to bake medium sized ones. When the fork passes through the potato easily it is done. The kettle in which the potatoes are cooked should not be used for anything else if one wishes the potatoes to be as wihte as possible.

Plain Boiled Potatoes in the Skin

Selcct potatoe of medium size, wash clean ,by using a vegetable brush rinse in clear water and cook in boiling salted water sufficient to cover. When done, drain and remove cover, shake kettle a few times, and the potatoes are ready to serve. Treat potatoes that ar eto be boiled pared in

Distribution of Seed Grain 1918

Good Seed is scarce—Place your order now with your County Councillor.

The Department of Agriculture has ordered 56,000 bushels of oats and 18,000 bushels of wheat.

Oats will be sold for $1.32 per bushel in bulk car lots, or $1.38 in bags in car lots laid down.

Wheat will be sold for $3.00 per bushel, in bags car lots f.o.b. distributing point for smaller orders.

Local freights will be paid by purchaser.

County Councillors and Agricultural Societies should place car lot orders immediately, stating destination for cars.

Delivery not guaranteed unless orders placed within three weeks, becauseof transportation difficulties.

New Brunswick is expected to bread herself for the duration of the war. Every farmer should grow some wheat.

DEPARTMENT OF AGRICULTURE
FREDERICTON, N. B.

BOY'S RUSSIAN SUIT.

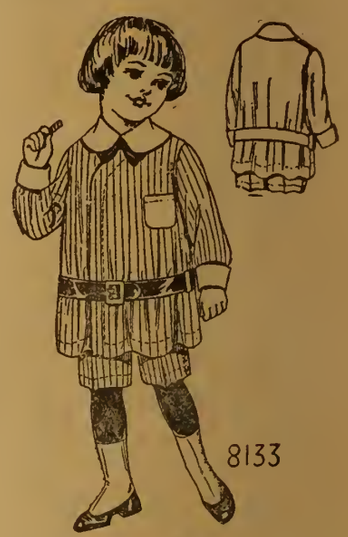
By Anabel Worthington.

The Russian style, so long the favorite with mothers and with Fashion, continues triumphant among the models offered for the small boy. It is, of course, decidedly boyish and when made like the suit shown by this drawing is sure to create interest.

The blouse, cut with smart closing outline, has a neat round collar of the goods or of material in different weave and opposing color; full length sleeves are cuffed to match. At a lowered waistline the fulness is neatly drawn in with a patent leather belt or one of the material in the suit.

A pocket is a little thing, but when a boy of six years is concerned it looms very large, so it will be to advantage to add a pocket to the left side, using self material or contrasting goods, according to the fabric that contributes the collar and cuffs. Any little fellow will feel proud and grown up if straight trousers complete the suit.

In most cases this type of suit is developed in St. Nicholas cloth, gingham, linen or galatea, but one may choose wool mixtures, serge or like weave for a kindergarten suit. There is very little work to copying the design and no worry at all, for the pattern is in pictures for your convenience.



The suit pattern, No. 8,133, cuts in sizes, two, four and six years.

To make in the medium size requires two yards thirty-six inch material; one-quarter yard thirty-two inch contrasting goods.

To obtain the pattern send 10 cents to the office of this publication.

GIRL'S RUSSIAN BLOUSE DRESS.

By Anabel Worthington.

One look at this design makes it clear to us why the fancy of fickle fashion is securely anchored in the Russian blouse. Truly it is a most satisfying style for the growing girl.

In the model illustrated the blouse slips on over the head, is loosely belted at a bit below normal waist line, with pockets in contrasting note clinging to the belt for novelty and to delight the wearer. The sleeve may be in three-quarter length and finished with a very lovely cuff, as pictured, or a long sleeve with its fulness gathered into a wristband cuff may be your choice.

The separate two gore skirt is of different material, but all one may be employed to advantage. Many mothers like a woollen weave for the skirt and linen for the blouse. Others use striped and plain material, as in the illustration, or reverse and make the blouse of striped, trimmed with plain material, and the skirt of plain ground goods. The detail touches are effective, but the lines of this model are so very simple that a girl who has been taught sewing in the schoolroom can copy the design without effort.

The pattern No. 8,153 cuts in sizes 8 to 14 years. To make in size 10 requires 1½ yards of 36 inch goods for the skirt and

trimming of blouse, and 2¼ yards of 36 inch material for the rest of the dress.

To obtain the pattern send to the office of this publication.

the same way, only remove skins in thin parings.

Baked Potatoes

Select potatoes with smooth skins, medium size, scrub well, put to bake on the bottom of a clean, moderately hot oven. When done, pierce in centre to allow the steam to escape. Baked potatoes should be served at once. They become soggy if allowed to stand.

Stuffed Potatoes

Select and wash as for beked potatoes. Bake. When done, take out two at a time. Cut a small opening the size of a teaspoon, scrape out the inside into a mixing bowl, using care not to injure the skins. After all the insides of the potatoes have been removed, mash, add butter, hot sweet milk as for mashed potatoes, salt and pepper. Beat together, put back into skins, brush top of epening with butter, set away until 20 minutes before time to serve. Place in oven and when they puff up and are hot clear through they are ready to serve. Do not allow to stand long before serving.

French Fried

Wash, pare and remove imperfect parts. Have a frying pan ready with hot butter or meat drippings. Slice raw uotatoes very thin in the pan until the proper amount is cut up. Season with salt and pepper; cover. Allow to cook one half to three quarters of an hour on a slow fire, stirring often to prevent burning.

Mashed Potatoes

Select and prepare as for boiling potatoes without skins. When done, drain; shake kettle a few times. Mash fine, add salt and enough heated sweet milk to slightly moisten the potatoes. Then whip with a large spoon until light and creamy white. Serve with a lump of butter in the centre of potatoes.

Scalloped Potatoes

Select and prepare as for boiling, then dice them. Put layer of bread or cracker crumbs in the bottom of a well buttered baking dish, then a layer of diced potatoes, and so on until the dish is as full as wanted, the last layer being of the crumbs rolled in melted butter in order to have them brown nicely. Season each layer of potatoes with salt, pepper and small llumps of butter. Cover with milk and bake one hour. Serve in dish.

It might be a good plan for potato growers when shipping potatoes in sacks to enclose a set of these recipes in each sack. Hotelkeepers and housekeepers could pin these up in the kitchen, and then if new and inexperienced help had to be depended upon thew would be urged to follow one of the recipes.

Fish Cakes

Flake fish from skin and bones with silver fork. To one pound of fish, add three or four potatoes, mashed till light. Season with salt, pepper, etc., little butter and bind with an egg or a stiffly beaten egg white, if desired. Mould into small cakes, dust with flour or roll in fine crumbs, and fry in hot fat until a delicate brown.

Codfish au Gratin

Flake 2 pounds of fresh boiled codfish that has been freed from skin and bone; add 1 cup bread crumbs, juice of 1 onion, 1 tablespoon chopped chives, ½ saltspoon pepper, ½ teaspoon salt, ¼ cup melted butter, 1 egg beaten in a small cup sweet milk, 3 tablespoons grated cheese, ½ cup rich milk. Put in well-buttered shells or baking dish, and bake a delicate brown.

Apple Catsup

Quarter, pare and core twelve sour apples. Put in a saucepan, cover with water and let simmer until soft; nearly all of the water should be evaporated; rub through a sieve add the following to each quart of pulp: One cup of sugth, one teaspoonful of cloves, one teaspoonful of mustard, two teaspoonfuls of cinnamon and one tablespoonful of salt, two cups of vinegar and two grated onions. Bring the catsup up to a boil and let simmer gentl yfor one hour. Bottle, cork and seal.

Apple Preserves

Use thre quarters of a pound of sugar to each pound of apples. Good flavored apples that are not easily broken should be used. Make a rich syrup of sugar and water and add a little ginger root tied in a bag; add a little lemon juice and boil a few apples at a time until transparent. Place in jars or glasses; boil the syrup untli very thick and pour over the apples. Crabapples make delicious preserves; core without paring until clear in a rich syrup, drain and place in jars; fill with the syrup boiled down.

Sweet Pickled Apples

Three cups sugar, 1½ cups cider vinegar, 1 stick ciinnamon, 1 dozen whole cloves, firm sweet apples as needed.

Tie spice in a piece of white cheesecloth; mix sugar and vinegar in a preserving kettle, drop in spice bag, bring to boiling point, and boil 10 minutes. Pare, core, and quarter the apples. Put enough of them into the syrup to be well covered with the liquid, and let them simmer until they are clear and tender if pierced wiht a toothpick. Then take apples up carefully. Place in a scalded fruit jar and pour on enough syrup to cover; when cold, clamp on top.

HAD TO GO TO BED KIDNEYS SO BAD

COULD NOT STAND STRAIGHT.

Women should not despair even if they are troubled with severe pains in the side or back, and not able to attend to their household dutics.

The kidneys of course, are to blame nine times out of ten, but they can be promptly and permanently made healthy by the use of Doan's Kidney Pills.

Mrs. H. M. Jansen, Pathlow, Sask., writes:—"I feel it my duty to recommend Doan's Kidney Pills to anyone having weak kidneys, as they have been a great help to me. A month ago my kidneys were so bad that I had severe pains in my sides and back, and it was impossible for me to stand straight. I then got so bad I had to go to bed, and was that way for a week. We sent for some Doan's Kidney Pills, and I have taken just about one box, and now I am able to be up and do my own work. I am certainly gratcful for the good they have done me."

To ensure getting Doan's Ki lney Pills when you ask for them, see that they are put up in an oblong grey box with our trade mark of a "Maple Leaf" on the label.

WHAT CAUSES JARS TO BREAK

When breakage of jars occurs it is due to such causes as:

1. Overpacking the jars. Corn, pumpkin, peas, lima beans and sweet potatoes swell or expand in processing. Do not fill the jars quite fulll of these products.

2. Placing the cold jars in hot water or vice versa. As soon as the jars are filled with hot syrup or hot water place them immediately in the canner.

3. Having the wire bail of glass top in jars too tight.

4. In a steam canner, having too much water in the canner. The water should not come above the platform.

5. Allowing a cold draft to strike the jars when they are removed from the canner.

6. Having the wire bail to tight, thus breaking the jars when the lever is forced down.

Defective Jars

The following are valuable tests for screw-top jars:

1. Place the top on the jar without the rubber. Turn it down tight. If the thumb nail can be inserted between the top and the glass the top is usually defective.

2. Place the rubber and the cap in position and screw down tightly. Pull the rubber from its position. Release it quickly. If the rubber returns to its position between the top and the jar the top is defective.

BEWARE OF UNDER-COOKED PORK

Impaired health and even death has not infrequently been caused by eating raw or partly cooked pork which was infected by certain parasitees which inhabit in their cystic form the muscular tissues of hogs.

One of these, the cause of "measly pork" is the cystic or early stage of the armed tapeworm of man and is to be feared for this reason. Should infested meat in which the cysts have not been killed. be taken into the digestive tract the parasite undergoes complete development, and the dreaded tapeworm is the result.

The other parasite. the cause of the condition known as trichinosis is probably the most dangerous of the two. It is a small spiral-like organism curled up in the form of a cyst and affects the muscles of hog and man, causing a severe inflammation and frequently causing death in man. Persons become affected by taking the live cysts into the digestive tract through the medium of improperly cooked pork and the parasites here develop and reproduce. the young working their way through the walls of the intesines and finally coming to rest in the muscles of the head, loins, tongue, diaphragm and hams.

When hogs are killed on the farm or in towns where no system of meat inspection is in force, care should be taken to cook pork thoroughly before eating. Heat is very effective in killing these parasites.—Wm. H. Feldman, Colorado Agricultural College.

RESTORE COLOR TO STRAW HATS

Editress Household Dept.

Please publish in your next issue how to clean a clear white straw hat that has got stained with rain and oblige

Hastings Co. J. W. P.

Note—The other subscriber who asked for recipe for cleaning white straw hat wil find desired information below:

Ans.—Any of following methods will whiten hat; cannot guarantee them to remain white. however. as the sun will tarnish them again. Sponge them with a solution of 1 part of citric acid to 20 parts water; then rinse and dry; or put a small quantity of oxalic acid in a clean pan, and pour on a little scalding water ; with this solution sponge the hat; salts of lemon moistened are also good for whitening hats and can be procured at any drug store for 10c a box. Chip and straw goods are often cleaned in the following way: put small quantity of oxalic acid in clean vessel and pour on it sufficient scalding water to cover the hat; put the hat in this solution and let it remain in it for about 5 minutes; keep it covered by holdig it down with a clean stick. Dry before a fire. The writer has no experience in this latter method. but it could be tested on some discarded hat. The salts of lemon though are reliable and also the citric acid.

THE CARPET MOTH

The carpet moth is the great enemy to be fought and defeated. There are several efficacious remedies, some of which are here given. One is to steep ¼ lb. of cayenne pepper in one gallon of water, then adding two drachms of strychnine powder. Strain and pour this into a shallow vessel, such as a large tinned-iron milk pan. Roll the carpet up and set each end, alternately, in this mixture for ten minutes, or long enough to ensure the saturation of its edges for about an inch. Do this after beating the carpet. The ends should be likewise treated. Be sure the carpet is dry before tacking the fingers while tacking. When done with the liquid, throw where it cannot possibly harm anybody, or bottle and label for future use, marking it "Carpet Moth Poison." This preparation will not stain the carpet nor corrode metals in contact with the carpet.

Another mixture consists of 1 lb. of quassia chips, ¼ lb. of cayenne pepper steeped in two gallons of water, strained and used as above.

When the carpet to be treated is not to be taken up spray ends, edges, margins, and corners with an atomiser. Perhaps two or three applications might be better than one with the atomiser.

The carpet moth loves the bindings and margins of a carpet. Ingrains or three-plys may be treated successfully while down by wringing a cloth out of hot water, laying it over the bindings and edges and ironing it with a hot iron. This will destroy both moths and eggs. This method is not effectual with Wiltons, Moquettes, or other heavy carpets, as the heat will not sufficiently penetrate them, besides which, ironing injures the pile of velvet; still, the backs can be drawn occasionally, and the carpet laid over on its edges—one side at a time—and steamed on the wrong side. Then wipe the floor under the carpet, as far as the arm can reach, with hot cayenne tea. Also wipe the edge and bindings of carpet with the hot rag, rubbing hard before renailing. Some recom-

196

mend springling salt around the sides of the room before nailing down the carpet, but this seems wrong, because the salt will surely attract too much moisture.

It is a good plan, where the moths are unusually bad, to saturate the floor with benzine, or preferably, we think, with spirits of turpentine, which is not so inflammable or volatile, and then lay newspapers down under the carpet. This prevents an attack from the under side. It is important to remember that the moth always abhors the light, which is death to the eggs and larvae, and is really the best thing with which to circumvent them.

Corrosive sublimate and alcohol, in the proportions of sixty grains of the former to a pint of the latter, is useful for treating the edges and seams of the carpet where the pest is bad, but the poison is so deadly that great caution is required in its use, especially where there are babies.

The moths deposit their eggs in the early spring. This, therefore, is the season to put away furs and woollen goods for the summer. It is not the moth, but the larvae, that does the harm. Thoroughly beat the goods with a rattan and air them for several hours, in the sunlight if possible. Furs should be carefully combed. Wrap up in newspapers perfectly tight. If this work is done properly there will be no need for airtight chest or cedar chest. Moths do not have any fear of cedar or moth balls, but they will not go through paper or cotton textiles. Indeed, a cotton bag or other wrapping is just as good as paper. Once a month take out the goods and examine them in the sunlight, and give them a good beating. When the moths are not so bad, as in some seasons and locations, this monthly inspection may not be necessary, but this is really the fur dealers' secret of preserving his stock. Camphor is bad for furs, as it impairs their beauty by turning them light. Camphor may be sprinkled among the woollens, but secure wrapping in paper or cotton is good enough. The above method may be used to preserve feathers also.

THE CARE OF CANARIES

A bath is required three times a week.

The birds should be fed at a certain hour each morning.

The room should never be overheated.

Place the cage so that no draught of air can strike the bird.

When birds are moulting, keep them warm and avoid all draughts night and day.

Give nothing to healthy birds but rape, hemp, canary seed, water, cuttle-fish, bone, and gravel paper or sand on the floor of the cage.

If tempted to feed, no harm can be done by giving some summer rape seed, a little hard-boiled egg mixed with some fine biscuit crumbs or some crisp lettuce once or twice a week.

USES OF SALT

Salt in the oven under baking tins will prevent their scorching on the bottom.

Salt puts out fire in the chimney.

Salt and vinegar will remove stains from discoloured teacups.

Salt and soda are excellent as a remedy for bee stings.

Salt thrown on soot which has fallen on the carpet will prevent stain.

EVERY WOMAN

Every woman should learn to rest if she wishes to preserve he good looks. Should she lead a busy life, she must acquire the habit of availing herself of every few spare moments for this purpose.

Hang the arms loosely at the sides and then begin to move them slowly backwards and forwards from side to side. Then open the fingers wide and shake the hands loosely from wrists, and after this practice the same exercise with the legs and feet.

One beauty expert considers that too many hot baths tend to destroy beauty and advocates a tepid bath every day. Exercise also can be indulged in to the point of fatigue, and taken in excess does more harm than good.

BRIGHT OILCLOTH

Try wiping your oilcloth with a flannel cloth wrung from clear, warm water and see how much brighter it is than when any old mop cloth is used and water in which soap or ammonia abounds. If skimmed milk is plentiful it is still better than clear water.

Linseed oil is a spendid oilcloth preservative, but it must not be used too liberally. It should be warmed until it will run freely. Use a flannel cloth, moistened, to spread it very sparingly over the surface. If the least thickness of oil is left on the oilcloth it will collect dust constantly and become a nuisance rather than a benefit. Simply rub the oily flannel over the oilcloth until it shines but leaves no trace of the oil itself.

CLEANING OILCLOTH

A dingy oilcloth may be brightened by washing it with clear water with a little borax dissolved in it; wipe over then with a flannel cloth that you have dipped into milk. Wring the cloth dry as possible.

Fruit stains on linen should be smeared with glycerine and left for about an hour before putting into the wash.

Persons but little accustomed to drink water are liable to have the waste products formed faster than they are removed. Five to six glasses of water a day should be the rule, if you desire good health.

The Pathé Sapphire Ball

versus

The Old Scratchy Needle

WHO to-day wants a talking machine equipped with a digging, scratchy needle that wears out your best records and necessitates the nuisance of ever changing needles. The Pathé genuine smooth polished Sapphire Ball never wears out, never requires changing. It reproduces the music in richer, more natural tones—for it completely fills the grooves of the record and gathers the music from a greater surface of contact, so that it does not lose the slightest shading or tonal effect.

Thus does this Pathé Sapphire Ball give you better music and more enjoyment from your instrument, as well as ensures longer life to your records Here's the Pathé guarantee :

"Every Pathé Record is guaranteed to play at least one thousand times without impairment to the unexcelled beauty of tone"

Pathephone

If you are planning to buy a phonograph, you should certainly hear the Pathé. You will be enchanted by its wonderful tone. If you already have a phonograph, it can be easily equipped to play Pathé Records—or — better still — any Pathé agent will make you a liberal allowance for it in exchange for one of the new Pathe Period Designs

Send for the PATHÉ CATALOGUE. It contains scientific explanation of exclusive Pathé methods of recording and reproducing sound, together with interesting chats on Period Furniture. Will be mailed free upon request.

USE STANDARD POULTRY

(Continued from page 323)

Characteristice of the General-purpose Breeds

Among the popular breeds of the general purpose class, there are also differences in type, adapting breeds to different uses. The Plymouth Rock is generally regarded as the type meeting the widest range of requirequirements in the general-purpose class.

The Wyandotte is a little smaller and earlier maturing, but still very well mated and easy to fatten.

The R. I. Red has nearly the same standards of weight as the Wyandotte, but is a more active bird, not putting on fat so readily; consequently, it approaches the laying type and is popular with those who want eggs and meat, but want eggs most.

The Orpington is at the other extreme in the general-purpose class, being a heavier, meatier fowl than the Plymouth Rock.

A Breed for Everyone and Every Purpose

Such a list of breeds affords so wide a range of choice, that poultrykeepers can always select a standard breed and better adapted to their locality and their purpose than any nostandard stock thcy can procure and have the further advantage of reproducing true to type.

MARKETS INTELLIGENCE DIVISION—LIVE STOCK

(Toronto Union Stock Yards)

Approximately five thousand cattle were on sale during the week, two thousand being offered on the Monday market, eight hundred on Tuesday, sixteen hundred on Wednesday and the balance on Thursday. With a liberal demand prevailing, prices advanced on Monday morning in a very active market, all cattle ruing from 25 to 40 cents per hundred above the closing prices of the previous week. Demand continued strong throughout the week, and on Wednesday, choice cattle were selling a shade above Monday's prices, while the market closed on Thursday with cattle in continued active demand. While there are a number of those choice cattle being marketed there is still quite a number of unfinishe d cattle coming forward. Very few heavy cattle were on sale ,thre being only a few lots offered that weighed over twelve hundred pounds. / Of the best quality animals over that weight, ten head sold on Monday at $12.75 per hundred, another draft of ten realized $12.25, while a straight load was weighed up at $12.00. On Wednesday $12.00 per hundred was about the top for this grade, the quality being scarcely as good on that date. For steers of ten hundred to twelve hundred pounds, $11.90 was the highest figure on Monday, being paid for a straight load weighing well over eleven hundred pounds. nIaddition between three and four hundred steers within these weights sold from $11.35 to $11.85, fifteen head of eleven hundred pounds bringing the latter price, while thirty three head sold at $11.75, and twenty six at $11.70. On Tuesday two head of eleven hundred and thirty five pounds sold at $11.25, and on Wednesday and Thursday quite a number of sales were made from $11.50 to $12.00. Of the steers and heifers under ten hundred pounds a pair of choice yearlings sold on Monday at $14.25, while on Wednesday eleven head of nine hundred and eighty pounds each realized $12.00; the top price on Monday for a straight load was $11.50, while on Wednesday thirty head sold at $11.75. Close to five hunderd head were weighed up on Monday at prices ranging from $10.75 to $11.50, most of them bringing from $11.00 to $11.25. On Wednesday and Thursday a number of loads sold from $11.25 to $11.75 per hundred. Cows and bulle were in active demand in sympathy with the demand for other grades of cattle, most of those of choice quality selling from $10.00 to $10.50, although a number of choice cows sold during the week at $11.00. Good cows sold from $9.00 to $9.75, medium from $7.75 to $8.75 and common from $6.50 to 79.50. A few extra choice bulls of fourteen hundred to six teehnundred pounds reached $11 during the week, but most of the choice ones sold from $10.00 to $10.75, medium from $9.00 to $9.75, and common bologna from $7..75 to $8.75. Little trading was done in stockers and feeders and only a few loads were shipped to country points. Calves were in active demand, choice veal reaching $17.00, while the majority of the best calves brought from $15.00 to $16.50 and common from $9.00 to $12.00.

Sheep receipts were light amounting to about five hundred head for the week. The trading in this department was a little more active than that of the p revious week. A few choice iambs sold at $19.00 and most of the best lambs offered sold from $18.00 to $18.75, light sheep from $13.00 to $14.50, heavy sheep from $11.00 to $13.00, and culls from $7.00 to $10.00.

Hog recepits totalled about ten thousand head, two thousand of which were consigned direct to a local abattoir; in addition several hundred were billed through. Select hogs sold on Monday and Tuesday at $19.00 per hundred, fed and watetred. On Wednesday and Thursday a number of sales were made at $19.10, the market closing firm under an active demand on the latter day.

Of the disposition from the Yards for the week ending February 14th, Candaian packing houses bought 352 calves, 75 bulls, 20 heavy steers, 2,245 butcher cattle, 7.639 hogs, and 663 sheep and lambs. Local butchers purchased 221 calves, 310 butcher cattle, 63 hogs and 60 sheep and lambs. Canadian shipments were made up of 58 calves, 93 milch cows, 20 butcher cattle, 186 stockers and 89 feeders. There were no shipments made to United States points during the week.

The total receipts from January 1st to February 14th inclusive were 27,317 cattle, 2,915 calves, 47.494 hogs, and 7,802 sheep; compared to 33,036 cattle, 34.357 calves, 64,394 hogs and 8.470 sheep received during the corresponding ped.od of 1917.

Montreal

The total receipts of cattle at the Montreal yards were twelve hundred head compared to nine hundred the previous week and fourteen hundred and fifty two weeks ago. A larger percentage of grain fed stock than any time during the last six months was on hand while the remainder of the stock consisted largely of fair to good quality heifers and steers weighing from nine hundred to eleven hundred and fifty pounds. These classes of stock met with the requirements of the trade and quick sales were made throughout at strong prices and in some instances at advances of from 25 to 50 cents per hundred. One steer weighing ten hundred and fifty pounds sold at $12.25 per hundred, this price being obtainable on account of the high dressing quality, the carcass dressing five hundred and ninety pounds or 56.2 per cent. of the live weight. Thirty head averaging nine hundred and eighty pounds, made up of a few steers weighing up to twelve hundred pounds and the remainder of light steers and heifers of various weights, sold at $11.75 per hundred. All were of good finish and high dressing percentage. Thirty five steers weighing from ten hundred and fifty to eleven hundred and fifty pounds sold from $11.50 to $11.75, while ten heifers weighing around nine hundred pounds sold at $10.50. Receipts of bulls were light and of a very wide range of quality.

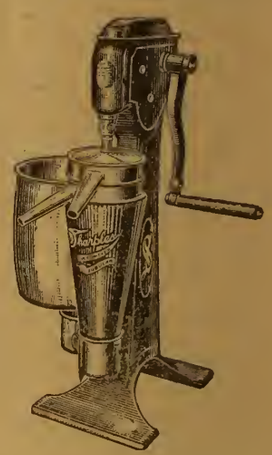
Prices were firm at a wide spread,

The "Guardian" of Your Cream Profits

It is not a bell; nor a speedometer; nor muscle—it's the *suction-feed principle* of the Sharples Separator. Other separators do not have this basic advantage—that is why all sorts of make-shifts are adopted. These merely *remind* you that cream is being wasted—they don't *remedy* it. To get maximum cream profits you must *skim clean at any speed*—and there's *only one way* to do it—use a

SHARPLES SUCTION-FEED CREAM SEPARATOR

Tests *prove* conclusively that 95% of all separators are turned under speed. As applied to the Sharples it does not matter—at 35 revolutions or at 55 revolutions *clean skimming is certain.* With any other separator (*no exceptions*) there is a constant waste of cream when turning under speed. This cream waste averages about 10 lbs. per cow per year, or the staggering total nationally of over 80,000,000 lbs.



Another big Sharples feature is the one piece bowl, *no discs to clean.* You get done quicker and feel in a better humor. Write for catalog. Address nearest office, Dept. 79

Send us particulars of your spraying needs and we will forward by return mail, absolutely free, a copy of our valuable illustrated work on Crop Diseases, also full details of a Spramotor that will best do your work Write to-day.

MADE IN CANADA—NO DUTY TO PAY

THE LONDON SPRAMOTOR, 5035 King St. East, London, Canada

sales being made from $7.50 to $10.50. the latter price being realized on eleven head shipped in from the Union Stock Yards, Toronto, Ontario. Very few choice cows were on hand. the majority of cows ogered being of fair to good grading and selling from $8.50 to $9.50 per hundred. choice animals sold from $9.75 to $10.50. Canner cows sold at $6.00 per hundred, being 50 cents higher in price than at the close of the previous week, while cutters also advanced and sold up to $7.00. About nine hundred veal calves all of dairy breeding. were ogered. Sales were quickly made at from $13.50 to $16.00 for those of good quality, $12.00 per hundred for heavy veal and $10.00 for those in thin flesh.

Sheep and lamb were few in number totalling only two hundred and six head on the two markets. Sheep sold at $13.00 and lambs aruond $16.50. Choice hot-house lambs, which are in light demand sold at $12.00 each during the week.

The run of hogs totalled over three thousand head compared to fifteen hundred last week. Despite the increase in receipts and the indifferent quality, the market was exceptionally strong, the majority of the run selling at $19.50 for selects, fed and watered. This price was o ncontracts made the previous week. and $19.75 was being offered at the close. The average weight of the hogs sold was one hundred and fifty pounds.

Pt St. Charles

Of the disposition from the Yards for the week ending February 14th. Candaian packing houses and local butchers bought 257 valces, 71 canners and cutters, 29 bulls. 255 butcher cattle, 603 hogs and 112 sheep and lambs. Canadian shipments were made up of 47 milch cows. There were no shipments made to United States points during the week.

The total receipts from January 1at to February 14th inclusive were 4,254 cattle. 1,249 calves, 6.909 hogs and 4.706 sheep, compared to 6.029 cattle, sheep, received during the corresponding period of 1917.

East End

Of the disposition from the Yards for the week ending February 14th. Canadian packing houses and local butchers purchased 163 calves, 397 butcher cattle. 670 hogs, and 34 sheep and lambs. There were no Canadian shipments or shipments to United States ponits during the week.

The total receipts from January 1st to February 14th inclusive were 5.093 cattle, 1.160 calves, 5,118 hogs and 4,373 sheep. compared to 6,920 cattle, 1.801 calves. 7,547 hogs and 5,413 sheep. received during the corresponding period of 1917.

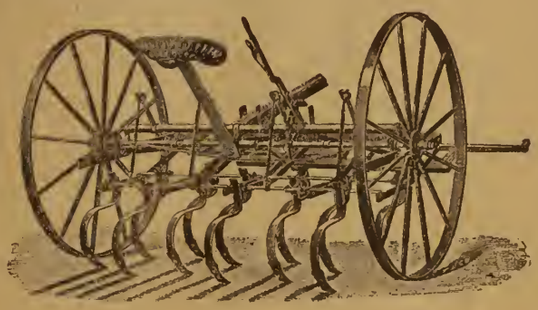
"Champion" Spring Tooth Cultivator

The hardest work you've got is what we ask for the Frost & Wood Champion Cultivator. It's got the design and the strength to do your cultivating just how and when you want it done.



Quick but Thorough Cultivation

You must have it for your plowed land to make your crops a success. It's a pleasure to use the Champion—it gets sure results.

The Frost & Wood 'Champion' Spring Tooth Cultivator

Helps you get a splendid seed bed with the least possible labor. Each spring tooth section works independently of the rest (so that uneven land is thoroughly cultivated) but all the sections are controlled by one easily-worked pressure lever. The frame is of heavy steel, the helper springs and teeth are extra fine-tempered spring steel. You can easily make it into a Broadcast seeder, too' with grain and grass seed boxes, and get positive feed and splendid results.

For cultivating, we can supply both 2-inch and 7 inch points—the 7 inch make splendid thistle cutters. It's an immensely strong, light-draft implement that LASTS.

Drop in at the nearest Frost & Wood Agency (or write our nearest Branch for catalogue) and see the full F. & W. line of Cultivators: "Climax" spring tooth or stiff tooth; cultivators for row crops, corn, etc., etc.

EQUIP BARNS WITH AIRY BOX STALLS, ETC.

(Continued from page 321)

high above head should be discarded from all stalls. It is the unnatural way for horses to feed. **Nature intended them to feed with head held low down, and this is the natural position to encourage the flow of saliva.** Also there is an added danger to the eyesight from feeding from a high rack, through dust, grass seeds and chaff entering the eyes.

To make a substantial strong and healthy box stall, it will be better to enclose the space intended for the stall with a low cement wall eight inches to one foot above the floor. Set some three-eights inch bolts in the cement while it is wet, allowing their threaded ends to protrude about two and a half inches above the cement. To these bolt some two by four studdings, and on this erect the division partitions. The boarding of the partition should be close for 4 to 5 feet, and above that should be left with the openings between the boards to allow free circulation of the air.

The floor should be made of cement, rough finished on the surface with a slope of two to three inches from manger to rear to keep it dry.

With the common earth floor, a great deal of the manure is lost by seepage, and the surface of the floor is difficult to keep smooth and clean. If heavy horses are kept on it, a great deal of work in the way of repairs will be needed to keep it even in passable condition. A plank floor has the same fault where heavy horses are kept, necessitating constant repair. They also are unsanitary, absorbing a great amount of the urine and a tainted air is the result. Whatever the plan of construction, strength and comfort combined with provision for light and ventilation should be given careful consideration.&O. V. J.

FUEL VALUE OF WOOD AND COAL

Two pounds of seasoned wood has a fuel value equal to one pound of coal. Of course, different kinds of wood have different fuel values, but in a general way the greater the dry weight of a nonresinous wood the more heat it will give out. Such woods as hickory, oak, birch, hard maple and ash have a comparatively high fuel value, one cord of four-foot wood weighing about 4,000 pounds. A cord of such wood is required to equal one ton of coal.

It is a well-known fact that the value of wood for fuel purposes depends to some extent upon the amount of moisture present. When it is green part of the heat which it is capable of yielding is taken up in evaporating the water and, therefore, the more water the wood contains the more heat is lost.

Those who are in a position to substitute wood for coal should by all means use the former. It must be remembered that in burning wood in an ordinary furnace the draft will be too great and it has been suggested that part of the grate be covered with sheet iron or firebrick in order to reduce the draft. If this is not done the wood will be consumed too fast so that heat is wasted and, in addition, there is actual danger of damaging the firebox of the furnace.

In order of their fuel value hickory must be given first place. It burns evenly and holds the heat. The oaks come next, followed by beech, birch and maple. Those who live in localities where timber is relatively plentiful will possibly get better results by substituting wood for at least a part of the coal. Where a furnace is operated it frequently happens that a fire must hold for a considerable time and in that case coal can be used to great advantage. Furthermore, the covering of the grate referred to above so as to prevent the too rapid combustion of wood can be accomplished by the use of some coal. Where soft coal is burned a large amount of ash is present and that means that there will be a sufficient covering on the grate to reduce the draft to the proper point for a wood fire.

IT PAYS TO TOP-DRESS MEADOWS

Spring top-dressing of grass land increases the tillering or number of stalks. In a Massachusetts field test where part of a field seeded down two years before was top-dressed with a high-grade fertilizer, the first cutting was seven times greater than where no fertilizer was used.

There were 1720 stalks to a square yard where the fertilizer was used, and but 508 stalks on the same area where it was not used; 5445 pounds of grass roots to the acre in the upper three feet and only 4084 pounds where no top-dressing was used. The gain in organic matter in the soil in the single season through the use of fertilizer was 1361 pounds, or 25%.

The additional vegetable matter in the roots is of great value in improving the subsequent tilth of the soil. By top-dressing, a good stand of timothy is usually retained, so that good crops can be secured in the future, whereas when top-dressing is omitted fields soon run out and other inferior grasses take the place of the timothy.

Wood ashes are a rich source of potash. It will pay, therefore, to burn the brush and trimmings from the orchard or woodland, and carefully save the ashes for fertilizer. Make the brush pile on a piece of bare, smooth land. As soon as the ashes are cool, scrape them together and store in bags or barrels.

KEEP COWS CLEAN

During the winter season when cows are housed much of the time it is especially difficult to keep them clean. The only practical way is to prevent them as far as possible from becoming dirty. The practical way to do this, suggests Percy Werner, of the University of Missouri College of Agriculture, is to use the modern stall. This stall consists of (1) a platform of proper length (54 inches for Jerseys and 60 inches for Holsteins, (2) a stanchion (preferably a swinging stanchion) which will prevent forward and backward movement; (3) a gutter in the rear of the cow at least 9 inches deep and 16 inches wide to contain the droppings.

When the cow is tied in such a stall most of the droppings fall into the gutter, the platform remains reasonably clean so that the animal does not become coated with manure every time she lies down. The manure should be removed at least twice a day and plenty of bedding should be used on the platform. If visible dirt is present in the region of the udder and flanks at milking time, it should be removed by grooming. A covered milking pail, which can be purchased at any dairy supply house, will keep from 60 to 70 per cent of the dirt out which otherwise falls into the milk from the cow during milking.

AIDING NATURE IN THE HEALING PROCESS

The onl ything that can heal a wound is the healing power contained in the tissues. All man can do is to aid in providing the conditions that will aid the healing process. In the early stages of a wound even the flushing with antiseptic solutions can not equal the efficiency of the tissues' own action. In a day or so when the tissues have adjusted themselves to the changed conditions, the use of mild antiseptic fluids is of great value to the control of infection, but in the beginning their use should be confined to thorough cleansing of the parts adjacent to the wound proper. Cleanliness is the most important factor in the management of a wound and its

PEERLESS PERFECTION

No matter how fast it comes, the most unruly animal can't break through a *Peerless Perfection Farm Fence*—it springs back into shape.

Made of heavy Open Hearth steel galvanized wire with all the impurities taken out and all the strength and toughness left in. Every wire is crimped making the fence into one continuous spring. Top and bottom wires are extra heavy. Will not sag. Requires less posts than ordinary fence. Absolutely guaranteed.

Don't buy a rod of fencing until you get our illustrated Catalog. Describes our big line of farm, poultry and ornamental fencing. Also Peerless farm gates.

Agencies almost everywhere. Agents wanted in all unassigned territory.

surroundings should be included in the process. It is usually not best to bandage a wound. When uncovered it will dry out. The germs that make trouble in a wound need moisture. In some cases bandaging is necessary. If flies bother the wound, dust on a powder made of 1 part iodoform and 4 parts boracic acid. A pepper or spice box is handy for applying it. The wound should have drainage so that any pus or moisture can run out or it may give rise to infection that will spread to other parts of the body. It it sometimes necessary to make an extra opening at the lower part of the wound.&N. D. Agr. College.

HANDLING THE FLOCKS DURING LAMBING PERIOD

(Continued from page 309)

Acute indigestion sometimes seizes young lambs. It is marked gy great distress and frothing at the mouth. Castor oil (a tablespoonful) is a good remedy

For sore eyes put a drop or two of a 16-per cent. solution of argyrol in the eyes once each day. This should be done with an ordinary medicine dropper.

Navel ill should be avoided by dipping the navel cord in a cup of the tincture of iodine soon after the lamb is born.

For scabs or Poc-like sores on the lips and nose, apply a fairly strong solution of sheep dip after the sores have been rubbed open.

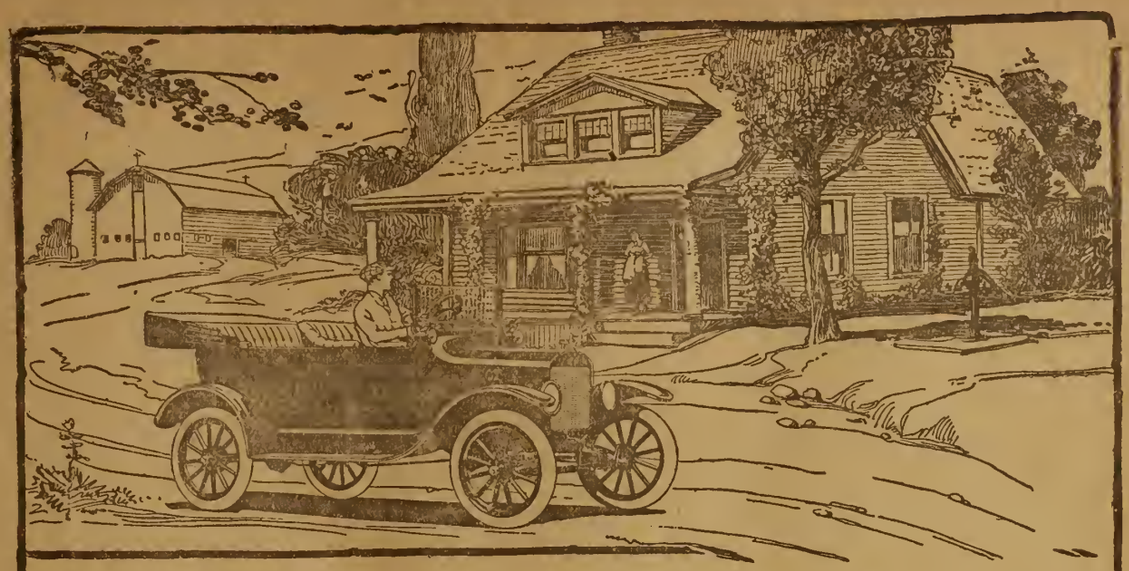
THE DRY COW

The dry cow usually receives but little attention; she comes to the calving in a thin condition. The thin cow at calving is in poor condition to make milk profitably and cannot produce the rugged healthy calf fitted to withstand the many calf ailments. Allow the cow four to ten weeks before freshening. A pound of meal a day during this dry period is worth as much as two or three pounds of meal per day fed after she has freshened. Feed bran and ground oats, plus one part ground oil cake make an excellent grain mixture. The oil meal on account of its cost may be left out and bran and oats, only fed. To the thin cow feed 4 to 7 pounds daily; if the cow is in good flesh, give 1 to 3 pounds daily of the above-mentioned grain mixture. If the cow is fat withhold the grain, but on the other hand do not sacrifice flesh or lose a thrifty condition. A thin cow is very likely to be a light milk producer after freshening. Much of the milk produced in the early lactation stages results from the feed the cow received when dry.

NOVA SCOTIA PROVINCIAL SEED FAIR—1918.

In spite of the unfavorable seed conditions an excellent show was held at the Agricultural College during the winter short course in January. It would have been larger if the weather conditions had not held up traffic from the eastern counties. Antigonish was well represented by good wheat and oats, but the men in Inverness did not get a chance to ship their grain. Most of the potato exhibits came from Colchester and Cumberland. The southern counties were well represented by the smaller grains and seeds. The show of beans was the most striking thing at the fair; there were over thirty exhibits from all over the province.

Many farmers were on hand to buy seed and several exhibits were sold at the close of the fair. It was not possible to buy in quantities as most of the growers were all sold out, while others were holding their seed until prices became settled. However, all who attended were impressed with the quality of the seed present and fully realized the ability of the Nova Scotia farmers to compete with professional seedsmen in supplying our own needs.



"I'm Off to Town, Is There Anything More You Want?"

YOUR son or daughter will be able to handle your shopping in town,—to take your produce to market, or to invite "hands" to the threshing or silo-filling, if you own a Ford. Furthermore they always will be glad to make the trips.

In doing these errands they take a man's place. They save your time—and that of a horse. This time saving means money to you, and again, a Ford, it has been estimated, costs less than two cents a mile to drive, or two-fifths of a cent a mile per passenger. The Ford is, therefore, much cheaper than a horse to drive. It is safer. It is more enjoyable. It requires less attention. It will soon pay for itself. The Ford is the farmer's utility car.

WHAT CONSTITUTES A GOOD COW

Are you working for your cows or are they working for you? The Steele County (Minn.) cow testing associatio nanswers this question by telling what 46 cows or 15 1-3 per cent. of the 300 in the association did during the month of January.

Forty-six cows made 71,231 lbs. of milk or better than 8,940 gallons of milk which gives each cow an average of 1, 548 lbs. or 193.5 gallons per month.

During the month of January 2,455.-15 lbs. of fat were produced by these cows. This fat at 47 cents, the average price paid for butterfat in January would be worth $1,149.22, or in other words, each cow porduced an average of $24.98 worth of butterfat. Ten such cows would bring in $249.80 for the month. Why milk 20 cows when 10 will give just as much?

Yes, but it cost a lot of money to feed these cows. Did it? Concentrated feeds, such as grains, bran, oil meal, gluten, etc., $301.61; roughage, including silage, hay, corn, fodder, etc. $187.40. Total cost for the 46 cows, $478.01 or $10.58 per cow. For every dolar's worth of feed they returned $2.35 in butter fat.

The highest producing cow was a Holstein, Spring Brook Beauty Posch 2nd. She produced 77.34 lbs. of fat, valued at $36.35.

Why isn't mention made of the poor cows in the association? That is just the reason these 300 cows are being tested every month, so that the poor cows can be found out and sent to the shambles. There is no guess work; the good cow produces a good record, showing she is a good producer, and she stays in the herd; while the poor cow's record shows her to be a consumer and a boarder, and her record entitles her to only one place—the shambles.

SKIN DISEASE AND PARASITES MOST PROLIFIC SOURCE OF UNTHRIFTINESS AMONG CATTLE

(Continued from page 319)

isolated as the whole herd is likely to become affected, in time, unless this precaution is taken. Even attendants are likely to carry the disease to other animals.

The insects burrow down into the skin and set up an irritation which breaks and runs a watery discharge, the hair falls off in patches and the animal is extremely itchy. One can make sure of this disease by examining a few of the scales under a microscope, when the small germs may be seen.

The treatment must be directed toward destroying the germs. One of the best remedies is zenoleum or creolin at the rate of two ounces or four tablespoonfuls to one quart of water. In mixing pour the water onto the drug in order to mix it thoroughly and then rub it in well all over the skin twice a week until cured. To prevent the disease from spreading wash everything the animal has come in contact with either with the same thing or with carbolic acid water. Feed on soft food and give a teaspoonful of sulphur to a grown animal.

Ringworm is quite common in some herds and quite contagious, especially with young cattle running in a box stall. This is another disease caused by germs burrowing in the skin. They work in circles and, like mange, are contagious to attendants as well as stock.

One of the cheapest and best remedies is to paint the spot with crude peroleum oil. as it comes from the ground, letting the oil extend over into the hair for half an inch all around the circle once a day until cured. Tincture of iodine, used in the same way, is another remedy and should be applied once in three days. Citron salve is also a sure cure and will usually need but one appliication. This wil need to be rubebd in, but no more should be used than is necessary.

Warbles are common in some herds where no attention iis given to keeping the trouble out. It is easily prevented by giving a little attention to the nuisance. It is caused by a large fly, called the gadfly, stinging the animal, usually along the back. This fly lays an egg down in the skin each time it stings, which develops into what is known as the warble.

The symptoms are that small lumps appear in the skin, principally over the animal's back. Toward spring these lumps which contain the grub become pierced and the grub gradually works out, falls to the ground and in a few days matures into another gadfly which flies off to sting cattle again during the summer. These flies may be easily got rid of by squeezing the grub out before the hole is large neough for them toescape and destroying them.

Foot Foul is a very annoying and often a very distressing disease that is also caused by a germ. It works between the toes or trotters often causing small boils to break out and even working up to the top of the hoof. The feet get hot and swollen and very sore causing the animal to lie down a good deal on account of pain in walking. If the disease is allowed to run on it becomes very hard to heal. The disease is contagious and if not attended to spreads to many or all members of the herd.

If the disease has ever ben in the herd the best plan is to spray the feet of all cattle with a large syringe or spray pump occasionally as a preventatiive and to destroy all germs that may be lying about. When first noticed, prompt measures should be taken to subrue it by the use of some good germicide such as enoleum, creolin, or a strong solution of copper sulphate or blue stone; put on as previously suggested. Plenty of force should be applied to a syringe or pump in order to make sure the solution reaches the spot. In putting this on it is not often necessary to fasten an animal as it can be done whlie she is standing naturally. If the case has been allowed to run until it becomes very bad it may be necessary to clean out the hoof and apply a poultice of linseed meal into which should be put some of the liquid mixture.

In a stable where there are milking cows it is advisable to use the blue stone mixture on account of the milk becoming tainted from the smell of the coal tar preparations.

Filthy stables, yards, and mudholes are very favorable to the development of this disease and on this account as well as for many other reasons they should be kept clean and sanitary.

PREPARE TO PROTECT YOUR CROPS NEXT YEAR

(Continued from page 315)

cover, as these are subject to the attacks of many insects, such as weevils etc. Seed peas and beans should receive special attention, and if they are infected they should be fumigated with carbon bisulphide.

In the spring special attention should be paid to the careful preparation of the land and time of seeding. Such special care will result in the securing of a more vigorous growth, and vigorous plants can more successfully withstand insect attacks.

Certain insects are more readily controlled during the winter months. In the provinces of Nova Scotia and New Brunswick fruit growers should make every effort to collect the winter webs of the brown-tail moth; the law requires owners of properties infested with this insect to adopt control measures. Throughout Eastern Canada there is at the present time a widespread outbreak of the white-marked tussock moth, which we expect to be serious next year. FFruitgrowers and owners of shade trees should now destroy as many as possible of the conspicuous white egg clusters in which the insect passes the winter; they can be scraped off the trees, fences, etc., or swabbed with creosote. Much injury next year will be prevented by taking such steps during the coming winter and early spring before the buds burst.

Farmers, fruitgrowers and others are urgently requested to take the fullest use of the offices of the Entomological Branch. Enquiries or calls for assistance addressed to the Dominion Entomologist, Department of Agriculture, Ottawa, to whom all communications may be mailed free of postage, or to any of the officers in charge of our field laboratories in the various provinces, will be given immediate attention and all the help possible will be rendered to secure the protection of crops. It is the desire of all these officers to assist to the fulelst extent of their powers. Let the mhelp you to protect your crops and thus increase our food supplies which are so vitally essential at the present time.

When a nervous, high-spirited horse is kept in a stall for any length of time he is apt to become impatient and express himself by pawing the floor and by other irritating actions. An active vigorous person acts in much the same way when shut up and forced to idleness. The best method of handling cases of this kind is to provide some work. If there is nothing that the horse can be used for turn him out in the barnlot for a part of the time and let him get rid of some of his surplus energy.

Two Cents a Word.

This department is one of the most vaiuable in the MARITIME FARMER. At a cost of only 2 cents a word, you can advertise anything you wish to buy, sell or exchange. The aderess must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue, which will always be found on the editorial page of the proceeding issie. No black faced type or display of any kind will be allowed under this head, thus making a small add as noticeable as a large one. The rate for this column is 2 cents a word, each insertion. MARITIME FARMER, Sussex, N. B.

would be a credit to any beef herd.

We are booking orders for spring delivery of our large English Berkshire young pigs. Not the short chubby type, but the lengthy, growthy and large.

L. M. ANDERSON, Sackville, N. B.

ARSENATE OF LIME

Warning in Regard to Its Use

By G. E. Sanders, Dominion Entomological Lboratory, Annapolis Royal, N. S.

Arsenate in the form of arsenate of lime costs but little more than half of what it does in the form of arsenate of lead. At the Nova Scotia Fruit Growers Association all of the experimenters who used it agreed that the arsenate of lime lime sulphur combination gave less burning of the foilage than the arsenate of lead lime sulphur combination. The experiments of the Dominion Entomological Branch have for two years shown that more apples remained on the tree where the arsenate of lime lime sulphur combination was used thain where the arsonate of lead lime sulphur combination was used. Experimenters and fruit growers all agreed that no injury had followed the use of arsenate of lime and lime sulphur for the first three sprays. These are points well worth considering and when we remember that the material comes in powder form and does not cause any black sludge in the bottom of the spray tank we must admit that the poison cannot be lightly considered.

In the papers and discussions at the N. S. F. G. A. it was found that in some experiments and in several orchards, when used with lime sulphur as a fourth spray, arsenate of lime had given some slight, and in a few cases, serious yellowing. This was without doubt due to the slow breaking up of arsenate of lime liberating small traces of soluble arsenic. If arsenic had been freed in any considerable quantities, as in the reaction of lead arsenate of lime and sulphur, burning instead of yellowing would have resulted.

In many cases yellowing was caused by the grower diluting his lime and sulphur away below the spray calendar and not reducing the arsenate of lime. Knowing that arsenate of lime is unsafe unless protected, we know that it was impossible for this procedure to result in anything but yellowing.

The elimination of small quantities of soluble arsenic, such as causes yellowing, proved an easy matter in 1917. Arsenatet of liime (¾ lb. to 40 gals.), which alone yellows badly, was made safe for four sprays by adding 10 lbs. of hydrated lime to 40 gals. of spray. The soluble sulphur (1 lb. to 40 gals.) arsenate o flime (1 lb. to 40 gals.) combination which normally yellows badly was made safe for four sprays by adding 10 lbs. hydrated lime to 40 gallons of spray. Arsenate of lead 10 lbs. to 100 galons, whiich normally yellows foilage, was made safe in the Experimental Farm experiments by adding 5 pounds of hydrated lime to 40 galons of spray.

For those who wish to retain the good points of arsenate of lime, and the point of cost is an important one, and do away with one defect that showed on the last spray in a few cases, we would recommend the adding of 5 lbs. of lime, either slaked or hydrated, to 40 gallons of spray. We do not beliieve that the addition of lime is necessary for the pre-blossom sprays. We know of no case where it was necessary for the third spray in 1917 but in order to be on the side of safety we would recommend for the third spray 2 gallons of lime sulphur, 1½ lbs. of arsenate of lime and 12 lbs. of water slaked or hydrated lime to 100 gals. of wataetr. This will not yellow apple leaves.

For the fourth spray we are recommending Bordeauax and not lime sulphur. Arsenate of lime is safe with Bordeauax.

While not more than two per cent. of the growers of the Valley had any complaint of yellowing (in a meeting of the Annapolis County Farmers Associationi, 50 men, most of the sprayers, were asked for complaints about arsenate of lime and not a man had any) we feel that the complaints made at the N. S. F. G. A. were well grounded and were due to traces of soluble arsenic. A few pound of hydrated lime will entirely eliminate all danger of yellowing for we overcame a much more serious trouble of the same nature in the soluble sulphur arsenate of lime combination by the same means in 1917.

The low cost, the reduction in burning, the handy powder and the freedom from slugs in the spray tank make arsenate of lime most desirable. The one defect of the new poison which showed in only a few cases in the fourth spray can be easily eliminated as outlined above.

OFFICERS OF N. B. FARMERS' AND DAIRYMEN'S ASSOCIATION

The Farmers' and Dairymen's Association elected officers as follows:

President, C. M. Anderson, Sackville; vice-president, J. A. Bernier, Edmundston; recording secretary, C. M. Shaw, Hartland; corresponding secretary, A. R. Wetmore, Clifton; treasurer, H. H. Smith, Hoyt. County vice-presidents: Albert— . . Mitton, Hopewell Hill; Carleton—Scott A. Shaw, Hartland; Charlotte—Stanley Wilson, St. Stephen; Kent—Simon Bastarach, Buctouche; Kings—H. H. Buy Wire Fence That Gives Service

There has been altogether too much cheap fence distributed throughout Canada and the result is the added expense of replacing it after a few years.

Frost Fence is all made in Canada and is made right to give long service and consequently satisfaction. At the present time, when all prices are high, it is more important than ever before that you get value for your money. Get that which will give you the best service.

Do not allow the low prices on inferior goods to warp your good judgment; because you live in the country of wonderful opportunities and you'll have a great many chances to use your money to better advantage than replacing cheap fences every few years.

Get Frost Fence—It Lasts

You will notice the illustration of the FROST HOLD-TIGHT LOCK. This is the binding or lock used where stay wires cross laterals. This lock is much superior to any other woven fence lock, and holds securely without kinking the lateral or running wire, thus weakening it. There is only a slight kink in the stay wire, and the general appearance is as neat as could possibly be wished for.

Frost Fence is made as low in price as it can possibly be made and still have the material, that wears, in it.

When you deal with FROST STEEL AND WIRE CO. LTD. you deal with a concern that has developed the "Service to Customer" idea to the highest pitch. We'll continue this policy throughout and we only ask the chance of a trial order that you can test it out and see just what a difference there is between ordinary wire fence and FROST FENCE.

ALL STYLES FOR ALL PURPOSES.

Frost Steel and Wire Company
LIMITED
101 HAMILTON CANADA

Distribution of Seed Grain 1918

Good Seed is scarce—Place your order now with your County Councillor.

The Department of Agriculture has ordered 56,000 bushels of oats and 18,000 bushels of wheat.

Oats will be sold for $1.32 per bushel in bulk car lots, or $1.38 in bags in car lots laid down.

Wheat will be sold for $3.00 per bushel, in bags car lots f.o.b. distributing point for smaller orders.

Local freights will be paid by purchaser.

County Councillors and Agricultural Societies should place car lot orders immediately, stating destination for cars.

Delivery not guaranteed unless orders placed within three weeks, becauseof transportation difficulties.

New Brunswick is expected to bread herself for the duration of the war. Every farmer should grow some wheat.

DEPARTMENT OF AGRICULTURE
FREDERICTON, N. B.

FARMS FOR SALE !

1. Desirable farm for sale, situated at Lower Gagetown, N. B., containing 100 acres or thereby, suitable for growing all kinds of crops; there is a splendid orchard on the property, containing about 500 apple trees of good commercial varieties.

The farm buildings are commodious and exceptionally good and there is ample water supply. Public wharf about one-half mile distant and railway runs through the property.

2. Farm with suitable house and buildings, situated about 3 1-2 miles from Gagetown, extending to about three hundred acres, about one hundred of which is good cropping land, the balance containing a large quantity of valuable pulp and firewood.

Bean Growing in Nova Scotia

By Prof. P. J. Shaw

Many of our readers grew beans last season on a fairly extensive scale. Hundreds of farmers who were accustomed to purchase their bean requirements grew a sufficient quantity to supply their own families. On four short drills in a town plot te editor of the Maritime Farmer grew a sufficient uantqity of beans to supply a family of eight persons with string and dried beans for one year. The followin article "Bean Growing in Nova Scotia" will interest all our our readers:

Beans are grown in this Province both for green string beans and for dry shell beans. For the first purpose the green and wax podded varieties of dwarf or bush beans are used and also the pole beans. For ripened dry beans dwarf beans are used.

The following article deals with the growing of dwarf beans for the ripened dry seed. The object is to call attention to the desirability of increasing the area in beans in Nova Scotia next year as a special war-time measure and to make a few suggestions as to varieties, source of seed supply and general culture of the crop.

As a field crop in Nova Scotia beans are grown most extensively in the counties of Annapolis, Kings, Hants and Lunenburg. It is probable that in these counties the soil and climate are better adapted to bean culture than in other parts of the Provoince, although North Queens, parts of Colchester, Cumberland, Pictou and Antigonish seem well adapted to this crop. The following table taken from the Census of 1910 shows the ocreage and the yield of beans in the different counties of the Province:—

Annapolis	267	4088
Kings	220	3197
Hants	75	1279
Lunenburg	70	1220
Queens	23	403
Halifax	13	339
Antignoish	19	301
Digby	8	221
Pictou	8	204
Guysboro	12	192
Yarmouth	7	104
Colchester	4	71
Cumberland	4	64
Shelburne	2	23
Cape Breton & N. Victoria	1	28
Capo Breton South	1	20
Inverness	1	12
Richmond	0	0
	735	11766

The above figures are for the year 1910, the latest year for which the census gives the statistice. In 1917 the area ni beans in Nova Scotia was estimated at 1,000 acres or more. The rProvince may be divided into two parts. (1) The part comprisgn thiose counties in which 1.000 bushels or more of beans per county are produced each year and (2) the rest of the Province where the yield per county is a few hundred bushels or less. In the first area the problem of grownig ripe beans presents no serious difficulties. If reasonable attention is given to cultural details any one of several varietesi can be grown with success. In the other part of the Province it is necessary to give more attention to the choice of suitable varieties and to the selection of the soil, its preparation and cultivation.

One of the most important matters is to obtain a supply of good seed. Home grown seed, if well grown and free from disease, is better than imported seed, since it is more lkely to be of a variety suited to local conditions. There is now an abundance of this seed for sale ni the bean growing sections of the Province. In order to insure a supply of the early varieties for section of the Province with short seasons the Horticultural Division of the Agricultural College has bought a number of bushels to sell at cost to planters wishing these varieties next spring.

Every one who intends to grow beans next year should provide himself with a supply of seed as early as possible. Seed beans are likely to advance in price before planting time in 1918. Seed merchants now say that there will be a shortage in the supply of beans next season. One large seed firm states that their seed growers this year report a yield of only 15 to 20 per cent. of a full crop of beans, due to early falll frost. The important point is not to delay in getting your seed beans. Buy now and be ready with hte best seed hw neplanting time comes.

With some families baked beans in the past have formed a regular article of diet twice a week, Saturday night and Sunday morning. In the lumber camps and where men are engaged in hard, physical, out-door labor they are served oftener thann this, constituting one of the most important parts of the rations. When beans of the right variety are chosen and cooked as some good cooks know how to do it and served with brown bread and butter, they not only constitute a wholesome food but a delicous treat, somethnig to be looked forward to.

On account of the probable shortage of meat in the near future, it is not unlikely that beans may have to form a larger part of our diet than in the past and be served oftener than twice a week. Because of their composition the are better adapted to take the place of meat than almost any other vegetable. Besides containing fat, meat is chiefly valuable for its protein the material used in building up muscular tissue. Beans also are rich in protein and compare favorably with other foods, as the following figures for ther anailysis show

Even though one cannot grow beans for sale, it is possible on a small area to grow enough to supply the family for the greater part of the year. A pound of beans when baked is sufficient for 10 helpings. For a family of five, then a buhsel would be sufficient for 120 meals. A bushel can be grown under ordinary conditions on 8 square rods. Under garden conditions it might be grown on 4 square rods. That is, a piece of ground of the right kind and situation, about 33 feet square might produce enough beans to serve a family of 5 for 120 meals. If served at four meals a week they would be sufficient for 30 weeks.

If the conditions are right, beans are one of the easest crops to grow. They are a short season crop, planted after danger of frost is past, and should reach maturity before the first fall frost. This may mean etaoni shrdul frost. When failure with this crop occurs it is often due to the beans not having reached maturity before the first fall frost. This may be due to one or other of several causes. The beans may not have been of the right variety, they may not have had sufficient amount of a needed plant food, the land on which they were planted may have been too cold or wet, the season may have been unfavorable, or the seed infested with disease. The important thing for the farmer to do is to make all the controllable conditions as nearly right as possible. With a normal yield of beans, at present prices, there is ont a more profitable cash crop to grow. The growing of beans also furnishes one of the most effective means of adding to the food supply of the country and reducing the cost of living. They can be grown profitably on a large or small scale, whichever is more convenient to the grower.

Varieties of Beans

The varieties of field beans grown in Nova Scotia comprise the following: Yellow Eye (including the ordinary Yellow-Eye and Improved Yellow-Eye) Pea beans (including Snowflake Field beana and California pea bean), the Soldier bean, the Early Yellow Six-weeks, a yarge white marrow bean and several varieties with local names, or no names excpet beans. Among the local varieties are a white bean mottled or speckled with dark purple, called ometimes Speckled wax or Turkey bean, and a reddish brown bean with dark markings on the sides resembling Improved Goddard, but smaller than the Goddard. The former bean is grown in considerable quantities in the Annapoli Valley, the latter quite largely in Antigonish County.

The horticultural classification of beans includes four types,—pea, medium, marrow or marrowfat, and kidney. For the purpose of this article beans grown in this Province are divided into into early, medium early, and late, according to the length of season required and the time of ripening. Early beans are represented by such kinds as Early Yellow Six-weeks, and the reddish brown Antigonish bean. Medium Early by the early Yellow eye. Soldier bean, and Snowflake Field bean and other white pea beans, late beans by the Improved Yellow eye. For the Annapolis Valley and parts of the Province with similar soil and season any one of the early or medium early varieties is sfae.

For most parts of Eastern and Nortehrn Nova Scotia, except a few specially favored sections, one of the early maturing varieties of the first group should be chosen.

The Early Yellow Six-weeks includes two strains, a kidney-shaped bean of pale yellow color and somewhat flat in shape and a bean of the same color but shorter and more nearly round, called locally Six-weeks Round. Both strains of the Six-weeks ripen in a short season and seem to be well adapted to all sections of the Province.

The ordinary Yellow Eye, is a white bean with a yellow area around the seed scar and belongs to the marrow or marrowfat group of beans. It is extensiively grown in the western part of the Province and to some extent in the Eastern part.

The improved Yellow Eye is somewhat longer and larger than the ordinary Yellow Eye and requires a season ten days or two weeks longer. It is not recommended as a safe variety even in Western Nova Scotia, although it is grown and ripened in that section.

The Soldier bean, so named because of the fancied resemblance of the colored area about the seed scar to a soldier, is earlier than the Improved Yellow Eye but not as early a the Early Yellow Eye. It is a good yielder and comparatively free from disease. It is a good variety for the Annapolis Valley and similar areas.

Several varieties of white pea beans are grown in Nova Scotia with success. These are generally good yield-

Milk	87.0	3.3	4.4	5.0	.7	325
Eggs	73.7	14.8	10.5	0.0	1.0	720

CLEANING SEED

The question of Good Clean Seed is now agitating the minds of the farmers of the Maritime Provinces. Good seed grain is scarce and high in price. The fanning mill will therefore be more vigorously used this season than ever before. Read the latest word in cleaning seed.

In cleaning seed the aim should be to produce a sample containing only the larger and plumper kernels of the kind of crop desired. To produce a sample of this kind it is necessary to remove impurities such as straws, chaff, dirt and other inert matter, weed seeds, seeds of crops other than the kind desired, and any small, shrunken, immature and otherwise inferior kernels of the kind cleaned.

Improper cleaning of seed is in most cases due to lack of the necessary riddles and screens, or to the mill not being properly regulated. Any good fanning mill in which thorough control over the air blast is obtained, and in which a series of four or mire riddles and screens may be adjusted at will, may be fitted and operated to do fairly good work.

General Principles

Imopssible to give Definite Directions.

It is impossible to give instructions for fitting and operating a mill which will apply in all cases, as different samples of the same kind of seed may require different treatment, even in the same mill. On the other hand, the same sample of seed would require different combinations of sieves in different mills, depending on the length and slope of the sieves, the direction and violence of the shake, the strength of the air blast and the way in which it strikes the seed and the rate at which the grain is passed over the sieves. The operator will have to depend on his own judgment and ingenuity in fitting a mill for doing the best work on any particular lot of seed. Even the directions furnished by the manufacturers of the mill should not be followed blindly. These directions are for cleaning the average lot and cannot be correct for every lot of grain of the same kind. Only general principles can be laid down for the guidance of fanning mill operators.

Importance of the Air Blast.—The air blast in a fanning mill is intended to remove as much as possible of the lighter material without unnecessary waste of plump seed; it is not strong enough unless a few good seeds are being blown out with the chaff. This is the only way of taking out some impurities which, on account of their size cannot be eparated by sieves. The work of the air blast is of double importance on account of the fact that the removal of the light material assists the sieves by (1) removing part of the grain that would otherwiise have to go through them; (2) preventing them from becoming clogged by this light material. In some mills this fact is taken into account when the air blast is increased, by automatically decreasing the shake of the sieves.

The air blast is a very important feature of a fanning mill, and it will pay to take pains to experiment to find out just what can be done with it. It is often advisable to run seed through the mill rapidly at first to take out dirt and chaff by means of the air blast, and then to clean it more slowly once or twice, using both sieves and air blast.

Full Equipment of Sieves Necessary.—It is most important to have a full equipment of both wire and perforated zinc riddles and screens of ali sizes made for small seeds. The want of any of these may entail a waste of good seed or other loss many times greater than the total cost of the full equipment of sieves.

Before fitting the mill for cleaning trials by hand should be made with the sieves arranged in series one over the other. It must be remembered however, that the results in the mill will not necessarily correspond to the work done by the same sieve used in the hand. It is only by actual trial in the mill that one can decide finally what sieve is best for the sample in question.

What the Top Sieve Accompliishes.—The riddle or top sieve should be just large enough to let the seed through a nd hold back the larger impuriaies. When weed seeds similar in size to the seeds in which they occur are very prevalent, their separation cannot be satisfactorily accomplished. I ncleaning such seed regulate the slant of the riddle, amount of shake and size of the opening in the hopper so that the sample will travel slowly and as much as possible of the seed will find its way through the riddle. Impurities larger than plump seed will travel the length of the sieve and fall behind. Do not give the riddle so much shaake or have it at such a pitch that much of the seed runs off with the weed seeds. Sometimes it is necessary to put small blocks of wood under the back of the mill to reduce the slant of the riddle.

The Work of the Lower Sieve.—The screen or lower sieve should be just large enough not to let the good seed through. It is not large enough unless small kernels of the kind of seed being cleaned are taken through with the weed seeds. Lower sieves are usually made of woven wire.

Seed should Travel Slowly over Sieves.— Usually when grain contains a large number of impurities the longer it takes to travel over the lower screen the more impurities are removed. Weed seeds much smaller than the grain in which the occur are often not removed when the operator is attempting to clean too fast and has too much seed on the lower sieve, or has given it too much slant.

Delivering Grain Behind Mill Sometimes Advisable.—More satisfactory work can sometimes be accomplished in cleaning a lot of seed by arranging the sieves so that the good grain is delivered at the back of the mill or in some place where impurities are usually delivered.

Sieves—Description and Numbers

Fanning mill sieves are of two general types, those made of perforated zinc and those made of woven wire. Perforated zinc sieving has either round, oblong or triangular perforations. There are square and long-mesh woven wire sieves.

The diameter of the perforations in zinc sieves is usually given in sixty-fourhs of an inch. For example, an "8" sieve usually means one with perforations 8-64 of an inch in diameter. The next smaller and larger sizes are 7-64 and 9-64, respectively, although half sizes sometimes occur. A similar system is used for the triangular and oblong perforations.

The mesh of woven wire is usually expressed by giving the number of wires to the inch each way; thus an 8 by a woven wire is one made of eight wires to the inch each way; a 2 by 10 contains two wires to the inch one way and ten the otehr. The size of the opening will vary with the diameter of the wire used.

The numbers which manufacturers put on the various sieves supplied with their mills often have no reference to the size of the peroarftion or mesh of the woven wire of which the sieve is made. For example, a sieve which a manufacturer designates as No. 12 may not be a 12-64 perforatated zinc or a 12 by 12 woven wire. It is not a difficult matter, however, to determine the size of the perforations or mesh of the woven wire cloth by means of a proper rule.

Cleaning Grass and Clover Seeds

It must be remembered that the sieves mentioned below are not recommended as the best or the only sieves for cleaning the various seeds in puestion. They are mentioned as examplples of the type of sieve most useful for the various purposes. The specific sieve required for cleaning any particlar lot of seed depends on a variety of circumstances as explained above.

The seeds of many of the weeds that grow in red alsike clover and timothy and ripen at the same time are of such sizethat they are difficult or impossible remove by sieves in an ordinary fanning mill. Few fanning mills are fully equipped with sieves for cleaning small seeds; indeed, most of them are not designed for this work. However, seed that contains a very large number of small weed seeds or that contains only a few more weed seeds than are permitted in seed that may be legally sold under the Seed Control Act may often be cleaned to grade without heavy- dockage, provided the proper sieve is available.

If there is a properly equipped and operated power cleaner within a reasonable distance it will usually pay to have seed cleaned by it.

For cleaning small quantities, hand sieves may be found to be most satisfactory and economical.

Red Clover.—A sample usually contains few weed seeds larger than the clover seed. Ragweed, if none of the outer hulls has been removed in threshing, should be separated from the clover by a 1-15 inch peforated zinc riddle. Sticks, pieces of straw anad anything larger than the clover run over this sieve.

A long mesh woven wire screen is better than one made of square mesh wire cloth for cleaning red clover seed. The 4 by 24 is often employed for this purpose, but the exact mesh required will depend on the size of the clover seed and the kind of impurities t obe removed. A long mesh sieve will hold all the good clover, allowing the smaller imprities to pass through. This sieve, assisted by the air blast, hould take out practically all of the pale plantation, much of the mayweed and lamb's quarters, and many of the ribgrass as well as shrunken clover seeds. Besides the 4 by 24 sieve, the 4 by 25, 4 by 26, 4 by 28, 6 by 24, 6 by 28, etc., are also recommended as lower sieves for cleaning red clover, their efficiency depending upon the size of the seeds composing the sample.

The 22 by 22 woven wire screen is very useful in the lower shoe for taking out sheep sorrel and seeds only slightly smaller than the clover. In some cases the 20 by 20 or 18 by 18 may be required, but this will allow considerable of the smaller clover to pass through.

Hulled ragweed, docks, catchfly, foxtail and black medick are very near the size of clover and are impossible to remove by means of an ordinary fanning mill. Fields must be cleaned of these weeds before clover seed can be grown with profit.

Alfalfa requires similar sieves to those recommended for red clover.

Alsike.—A zinc riddle with perforations ⅛ inch in diameter is about right to remove weed seeds and other impurities larger than alsike, includngi Canada thistle and docks. This sieve is used above, the larger impurities beinig held and run off at the end while the alsike passes through. With this sieve the air blast should be correctly controlled in order to insure a good separation.

The 24 by 24 woven wire sieve (contains 24 wiires to the inch each way) used in the lower shoe, is one of the most useful sieves for cleaning alsike. It will improve the general quality of the sample by removing the small and and immature alsike along taoi wyp immature alsike along with the smaller weed seeds—chickweed, worm-seed mustard, plantain, shepherd's purse, and seeds similar in size. These small materials pass through the 24 by 24 sieve while th eplump alsike is held back.

Timothy.—Weed seeds and other material larger than timothy are removed by a sieve which with the aid of the air blast will hold back the impurities and run them over the end of the sieve while the timothy passes through. A zinc sieve with perforations 1-22 inch in liameter, if used with only a slight slope and given a short puick shake, will accomplish this. This sieve should be used above and should take out docks, Canada thistle chicory, and imprities of similar size. If the riddle is used with much slope and given a wide violent shake much of the timothy will run over with the imprities. By exercising a little ingenuity the 1-22 inch perforated zinc sieve may be used to advantage in most mills. The 22 by 22 woven wire sieve is sometimes used as a riddle in cleaning timothy seed.

For removing sheep sorrel, ribgrass, black medick, catchfly, wild mustard and other impurities only slightly larger than timothy, a hand sieve made of 1-25 inch perforated zinc is recommended whe nnot too large a quantity is to be cleaned.

Woven wire screens are recommended for the separation of weed seeds smaller than timothy; they should hold the timothy while the weed seeds pass through. They are used below and are not assisted by the air blast.

It is difficult to give explicit directions as to the proper mesh of woven wire to be used in this work. A square mesh containing 28 or 30 wires to the inch each way is often used. For plump seed the 28 by 28 is preferable; the 30 by 30 is used for smaller seed. If the screen is long and the timothy contains only very small weed seeds such as cinquefoil and northern gentian, a 32 by 32 will giv egood results, especially where the timothy itself is quite small. Instead of these mesh sieves the following long mesh are sometimes used: 6 by 30, 6 by 34, 6 by 38, or 8 by 40. One of these woven wire sieves for removing small weed seeds is indispensable for cleaning timothy.

Weed seeds almost the same size as timothy and therefore difficult of separation are small-seeded false flax, ox-eye daisy, ribgrass, golden dock, stitchwort, mayweed, catchfly, black medick, sheep sorrel, blue-eyed grass, lamb's quarters, and wall-flower.

Cleaning Cereal Grains and Flax

In cleaning cereal grains for seed it is often advisable to remove from one-third to one-half of the total bulk. When grain is thus thoroughly cleaned most of the weed seeds will be removed with the screenings. Some of the weed seeds are difficult to separate, but most of them can be removed by a good fanning mill if the proper sieves are at hand and sufficient time and pains are taken to determine the best combination of size and slope of sieves, shake, air blast, and rate at which the grain is passed over the sieves.

In cleaning cereals, especially wheat attention should be given to the removal of the smut. Unbroken smut balls are impervious to the solutions used to destroy smut spores on the surfac of the kernels. Unless all smut balls are removed from a lot of wheat, the grain iis liable to be reinfected, thus rendering the labor of treating it of no avail, by the breaking of a few of these smut balls. One smut ball contains millions of spores, enough to infect quite a large quantity of grain. Bulletin No. 73 on "Smut Diseases of Cultiivatetd Plants" says:—

> "The fanning mill will remove smut balls very completely from the wheat, and owing to the danger pointed out, any wheat containing smut balls should be sent

(Continued on page 362)

Food Controller Prohibits Millers From Forcing Flour Sales

Flour Mills Are Not Allowed to Make it a Condition to the Sale of Feeds That So Much Flour be Taken to Each Car---Will be Closed if They Persist

Some months ago the Maritime Farmer undertook to arrange for the purchase of feeds for a number of Agricultural Societies in the Maritime Provinces. It was not long before the fact developed that the millers were not disposed to sell their feed direct to the farmers. While the farmers might be expected to whole-heartedly enter into the movement to help win the war by their increased production they were denied absolutely the right to get back their by-products except through various middle channels which meant increased cost to them. Early in the summer of 1917 when hundreds of straight cars of feed were being shipped to various points in the United States, the Canadian farmers were refused delivery of either bran or middlings in straight cars.

In August the Maritime Farmer called the attention of Hon. J. W. Hanna to this condition. Four months later action was taken to prevent the export of these feeds. That is, after the supply had become exhausted and the millers had made all the money they could possibly make out of the movement of feeds, the Food Controller undertook to lock the stable door.

In October the Maritime Farmer was promiscd that straight feeds would be sold the farmers and would be supplied at cost. Nothing resulted however, except that the Campbell Flour Mills, producers of "Cream of Wheat Flour," came to the rescue and supplied feed to the extent of their ability. The Maritime Farmer wishes to express its appreciation of the action of the Campbell Flour Mills and trusts that the readers of this paper will appreciate the service given.

In November the Food Controller requested the Live Stock Branch of the Dominion Department of Agriculture to take over the responsibility of handling feeds. With a flourish of trumpets it was announced that the farmers would be supplied with feed and the beneficiaries were asked to bow down and offer adoration to the deities who had conferred the boon. However, beyond securing a few cars of feed in the early part of December, the feed section of the Live Stock Branch of the Department of Agriculture died (let us hope) a painless death. The scheme, however, has supplied camouflage from its inception to the present day, when straight feed has been demanded, and has been a useful goat to which the Food Control Branch has been wont to refer the Maritime Farmer and other inquirers.

As the Food Controller of Canada has stated directly and indirectly that the safety of the Britiish Empire and the lives of the men in the trenches depended upon the conservation of wheat flour, and as the practice of the millers has been to demand that feed purchasers take so many barrels of flour to each car of feed, it occurred to the Maritime Farmer it would be well to give the Food Controller credit for knowledge whereof he spoke. Farmers in their conventions were told by representatives of the Food Control department that mid-summer would see food so scarce in Canada that actual want would be the lot of those of us who have not gone to the front. Deeming that the safety of the British Empire, the lives of the sons of the Canadian farmers, the spoilation of Canadian homes and the possible violation of the chastity of Canadian women, to be matters of more weighty import than the convenience and interests of the milling companies, the Maritime Farmer protested against the sale of feeds when the taking of flour was made a part of the contract. This paper considered that if life could be conscripted, then it should be a very easy matter to conscript the services of the flour mills of this country.

The discussion between the Maritime Farmer and the Food Controller led to a declaration by that official that if instances could be furnished him where the sale of flour was made a condition to the supply of feed, he would close any mill so offending. The Maritime Farmer did not think itself called upon to act as a detective and suggested to the Food Controller that he could find ample evidence of such transactions on the letter files of any flour mill in Canada. The Maritime Farmer further offered to pay for an advertising campaign so that the public might be informed that it was a breach of law on the part of the millers to insist on flour being taken by a prospective buyer of feed. The offer was declined. The Maritime Farmer further offered to give its services free pay its own railway and hotel expenses if the Food Controller would appoint one of its employees as his representative to get such evidence and to clothe such official with power to demand access to correspondence covering such matters. That offer has never been acknowledged.

Then it was determined by the Food Control Office that feed and flour must be handled through the usual channels. That is to say, it must go through the wholesaler and retailer. A price was fixed for bran of $24.00 per ton f.o. b. Fort William and $30.00 for middlings f. o. b. Fort William. This made the price delivered at Maritime points $37.50 for bran and $42.50 for middlings. The Food Controller further stipulated that merchants handling these materials should charge a profit of $1.00 per ton on feed sold for credit. This regulaon feed sold for credit. hTis regulation would make the legal price as follows: bran, cash, $38.50; middlings, cash, $43.50; bran, credit, $39.50 and middlings, credit $44.50.

That this has been exceeded in all parts of the Maritime Provinces is vouched for by farmers in all sections of New Brunswick. Fifty dolars per ton for middlings seems to be the popular price. It may be stated that in cases where these prices are exceeded and information is laid with the Food Controller that he is prepared to take action against the person so offending.

In this connection the following letter which was received by the Maritime Farmer will be of interest to those interested in the feed and flour game.

"As soon as I receive the full data in answer to the charge will lay same before you."

"We have notified the mills that unless this practice of endeavoring to force out the sale of flour with cattle feed is stopped that we will cancel the license of the miller and prevent him operating unless he desists from such practice."

"In addition to individual cases have written the secretary of the Millers Committee, pointing out that they had better use their influence to stop this practice and so save cancellation of licenses. The committee in session today have pedged themselve to do their best to stop same in the future."

"The above is mentioned to you so that you may realize that your effort on behalf of the farmers has brought forth fruit."

"Unfortunatetly there seems to have been a misunderstanding arisen out of our correspondence. The writer is very anxious that such shall not exist, and if there is anything that I can do to remove same or to further the good work in which I understand you are very active, it will be a great pleasure for me to do so, and I will be glad to hear from you respectinig same."

Yours very truly,
CANADA FOOD BOARD,
per Frank H. Keefer,
Counsel and General Adviser.

To Mr. J. D. McKenna,
Sussex. N. B.

This indicates a geat victory on behalf of the Maritime Farmer. Merchants and others desiring to purchase feeds should promptly notify the Food Conrtoller in cases where prices quoted are exceeded and where the condition is imposed that the buyer take flour. The Maritime Farmer considers that not only has it won a victory for the farmers but if the contention of the Food Controler is right, that the safety of the British Empire depends upon the conservation of flour this paper has struck a pretty hard bolw in behalf of that greatest of all Empires.

The Maritime Farmer cheerfully accepts the offer of the Food Controller made on March the 8th. It believes itself to have been in the right during its fight for the saving of the lives of the men in the trenches, the preservation of the British Empire and a fair deal for the farmers of this country. The promise of the Food Controller is an explicit one and he will be judged by the result of his ruling. The Maritime Farmer is prepared to co-operate with Mr. Thomson, to bring its influence to bear on the farmers of thi scountry in order that they may be exhorted to help win the war. It does maintain, however, that if the farmers render this service, it is up to Mr. Thomson to see that they are amply protected. There should be no more letters written from his office to Agricultural Societies discouraging them from buying co-operatively. There should be no more special pleas made form his office on behalf of the millers who have flour to sell. It should be a fifty-fifty proposition between Mr. Thomson and the farmers of this country. The Maritime Farmer fired the first shot for increased production in August 1914. It hopes to be in the firing line to the end of the game and it believes that if the farmers are to devote their efforts to increase production, then some other industries in this country, including flour mills, should be expected to come over with at least a little patriotism.

To say that the millers should be allowed to do business as usual when there is nothing going on as usual in this world is asking too much of a long suffering public.

Farmers Getting Together

United Farmers of New Brunswick are Organizing in Carleton County --Rest of Province to be Taken in Later

The United Farmers of New Brunswick, if the name of the newest Farmers' Association in New Brunswick and the movement is off to a good start in the county of Carleton. Already many branches of the Association have been formed and demands are coming in from all sections asking for meetings, to be addressed by the organizers. However, those interested are doing all that men can possibly do and day after day are meeting new friends, who have at last been brought to a realization of the need for co-operation among farmers and the lasting benefits that must result from a proper cementing together of their forces. Possibly there may be hitches in the future and disappointments, but the game is on foot and the result of the splendid work being done in behalf of a real union of farmers cannot fail to bear fruit.

Among those who are taking part in the organizing of the United Farmers are Messrs. C. L. Smith, Woodstock, C. Gordon Sharpe, Pembroke, and Thomas W. Caldwell, Florenceville. Mr. Sharpe is the official organizer. All are men of high standing and are favorably known in the county of Carleton. They are paying all their own expenses anad are travelling to all parts of the county, holding meetings and assisting newly formed branches to get down to business. Later they will extend their work in other directions. Plans have alredy been perfected for the holding of a large central convention next summer which will be attended by hundreds of members of the organization and the movement will then be given further impetus. The three gentlemen mentioned appeared before the Farmers and Dairymen's Association and laid their plan before that body. Later they met the directors of the New Brunswick Agrciultural Societies United and the two bodies decided, that having the same objects in view, they would work together and each would help the other.

The United Farmers enjoys a constitution similar to that adopted by the Grain Growers of the West, a body which exercises a very great influence on the public opinion of that section of Canada. The objects of the United Farmers, are in part:

(a) By fostering mutual understanding.

(b) By encouraging the study of

RECEIPTS FOR FARMER SUBSCRIPTIONS

The Maritime Farmer, instead of giving you one receipt in the year for a paid subscription, sends you 24, or one every two weeks. You will find it on the GREEN COLORED LABEL on which your address appears. The date printed thereon is that on which your subscription terminates. If on payment of your subscription the date is not changed within two weeks, please notify us. No other receipt will be sent.

THE UNITED FRUIT COMPANIES SUCCESS WITH CO-OPERATION

At a late meeting of the Director's of the United Fruit Companies, the Secretary gave a brief resume of the half year's busniess.

Beginning but ten years ago with seven members doing a business of only a few thouands of dollars, the Company rapidly increased its volume of business until last year under the vigorous management of A. E. MacMahon, it reached a total turnover of $,160.000. The Secretary reported that this year to date $350.000 worth of feed and flour had been bought and distributed among the members, while their full requirements of fertilizers, seeds, spray materials, etc., had been secured at most satisfactorp prices. When it is borne in mind with what intense anxiety those outside of the co-operative movement are looking about for similar supplies it will be readily seen what an advantageous position the members occupy. The protection which the United Fruit Companies is thus able this year to afford its members can hardly be overestimatetd.

Another very satisfactory part of the Company's business is thePotato business. Mr. R. N. Clark, the Company's representative who has just returned from Cuba, was again able to present a most satisfactory report. Previous to the organization of the United Fruit Co. potato buying always began in the fall at 40c. per bushel, dropping very quickly to 35c., at which price the bulk of the potatoes were marketed. Last year, after deducting all necessary hauling cahrges, the Company was able to allow its members three dollars and twenty cents ($3.20) per barrel. This year, notwithstanding the larger production of both Canada and the United States, the Company hopes to do even better.

As co-operation was originally begun in the Valley solely to market fruit, it will be seen that in addition to fulfilling its first purpose—always a most difficult problem and this year especially so since the war has cut off the Europeaan markets—co-operation is performing in addition to this a most valuable service for its members.

Fruit so far marketed which includes over seventy-five per cent of the crop, has brought the members fairly remunerative prices and there are those who freely predict that the apple season will end with a measure of satisfaction to the rgower far greater than the most sanguine could have predicted at the beginning of the season.

What the United Fruit Companies of Nova Scotia have been able to accomplish in the way of successful co-operation may well be emulated in many sections of Maritime Canada, where heretofore concentrated effort was sadly neglected.

OLEO MARGERIN

The introduction of Oleo Margarin on the Canadian markets has not given the redress to the masses that would like to procure butter or a butter substitute at lower prices than they can at the present time. The Maritime Farmer predicted from the time the movement to throw down the bars to Oleo was first mooted that this would be the case. Oleo is sold for a price so near that of the genuine article that the consumers prefer to pay a trifle extra and get the pure unadulterated "cows butter" that they have been accustomed to use in the past.

The following series of question answered by Dr. Wiley in a recent issue of "Good Housekeeping" will be of interest to our readers in general:—

Banquo's Ghost Will Not Down

"For the past two months we have used "Nut Margarin" exclusively as a butter substitute. During the last mnoth my husband and myself have experienced indigestion and headaches and sore gums. We had both been in good physical condition prior to the last few weeks. Will you kindly give us your opinion on the matter."—Mrs. K. S. C., New York.

"As a result of my investigations of benozate of soda in human food I made the following statements, which I quote from page 1293 of Bulletin No. 84, part 4, Bureau of Chemistry:

'It is evident that the administration of benzoic acid, either as such, or in the form of benzoate of soda, is highly objectionable and produces a very serious disturbance of the metabolic functions attended with injury to digestion and health. . . .

"These injurious effects are evident in the medical and elinical data which show grave disturbances of digestion, attended by phenomena which are clearly indicative of irritation, nausea, headache, and in a few cases of vomiting."

You will see from the above that indigestion and headache may probably be due to the influence of benzoate of soda. I never noticed sore gums, however, in my investigations. This is more indicative of poisoning by calomel.

Not For Children

"In connection with Mr. Hoover's recommendation that butter substitute be used wherever possible, we have been trying Nut Margarin, as per label enclosed. We are somewhat in doubt as to the advisability of using this product for growing young children, especially as we note that it contains one-tenth of one per cent. of bezoate of soda. Also can you give us the name of one or two others in the manufacture of which it is not necessary to use benzoate of soda.—M. H. M., New Jersey.

"As far as I am concerned, I should never give my children Nut Margarin, Oleomargarin, or any other margarin, as a substitute for butter. Butter contains a vital principle necessary to the growth of children which none of its substitutes possess. I should never give children nor grown persons in my family food products containing a preservative, such as benzoate of soda. Benzoic acid is regarded as a toxic agent by all physiologists. The human body also regards benzoic acid as a toxic agent, and immediately convetrs it into hippuric acid, in order that it may do as little harm as possible. Food products that contain benzoate of soda are inferior in quality to similar foods manufactured without it."

ENGLAND ESTABLISHES OFFICIAL SEED CONTROL STATION

The establishment of a system of Official Control of seeds in England and Wales is announced in the "Journal of the Board of Agricluture" (England) for December 1917.

The opening of the official seed labratory and the passing of an order requiring that the principal kinds of agricultural seeds be tested and when exposed for sale labelled with the essential facts in regard to their purity and vitality, is an evidence of the advance in the application of Science to Agriculture brought about by the vital needs of food production.

In opening the station, Mr. Prothero, President of the Board of Agriculture, said that a good deal of inferior seed found its way to the famrer, and during the war the inferiority had increased. Owing to the closing of some agricultural colleges and the reduction of the staffs of others there had been less seed-testing during the war than usual. The increase of food production was a matter of national importance, and good seed was one of the most essential reuqisites for that increased production. The farmer must be provided with a supply of pure seed of good germinative power.

In Canada we have had a seed laboratory at Ottawa since 1902 and one at Calgary since 1907. Duirng the last year 12.431 samples were tested at Ottawa and 13.547 at Calgary.

SWITCH ON

A dairyman who practices cow testing wrote recently, "I have just sold a grade cow for three times what she cost me three years ago. I could not have sold her had I not kept records.

Another letter reads, "Please send me more record forms for twelve cows, my best cow made one hnudred and seventeen dollars profit over her feed cost last year."

A typical letter runs, "I would like you to send me forms for daily weights for twenty cows. We have weighed each cow's milk for three years and would not care to go back to the guess work system again."

Such letters come frequently to the Dairy Branch at Ottawa from men who believe in cow testing, they know that it pays to weigh and sample each cow's milk, they are on the right track to increased yields, lower expenses, larger profits.

To continue dairying without individual cow records, but with only the unsatisfactory "average" of the herd, is simply to remain on the switch instead of being on the main double track of progress and profit. Don't let insufficient cow knowledge switch you off.

THE MILKING MACHINE

The object of this article is to put before the dairy farmer the value of the mechanical milker under the present conditions of labour on the farm.

There has been in the minds of many dairy farmers a great deal of prejudice against the use of a mechanical milker, but the present is no time to let prejudice stand in the way of increased production.

Eevery dairy farmer with a herd of 12 or more cows should consider seriously the installation of a milking machine.

The experience of an ever-increasing number of practical farmers, coupled with that of a number of our Experimental Farms and Stations, goes to prove that these machines are decidely advantageous.

Cost of Installation

The average cost of intsallation, taking into consideration the five most popular machines on the market, would he about $500 for an outfit to milk four cows at once.

Such an outfit would be large enough for a 25 to 35-cow herd.

For a 20-cow herd a 3-cow outfit would be sufficient. For a 12 to 15-cow herd a 2-cow outfit would be sufficient.

For each reduction of nne unit in the installation there will be a reduction of approximately $100 in the cost price.

This brings the average cost price to $16.60 per cow for the large herd; $20.00 per cow for the medium-sided herd; and $25 per cow for the small herd.

This in turn goes to show that while the cheapest installation for work-done is with the large herd, nevertheless the first cost is not excessive in the case of a small herd.

Cost of Operation

The annual cost of operation for a 25 to 35-cow outfit, including repairs, power, labour in caring for engine and washing machines, interest on investment, and ten per cent. depreciation on machine would amount to approximately $225.

The above is approximately one-third of what the farmer is at present paying his hired man, where the board is not taken into account.

Divided between 30 cows, this brings the running expenses to two cents per cow per day.

Above Cost Compared With Cost of Hand-Milking

The average hired man will not milk more than seven cows per hour, which at 25 cests per hour, costs 7.2 cents per cow per day for hand-milking.

One man with a milking machine can milk 20 to 25 cows per hour, which brinbs the total cost of machine-milking, including the above-mentioned daily running expenses, to 4.5 cents per cow per day.

This is a saving of considerably over one-third and in a large herd would enable the farmer to dispense with at least one, if not two, men, or it would liberate these men for other important lines of increased production.

It also enables one man to milk many more cows than it is physically possibile for him to milk hy hand.

Uniformity in Milking

Not only does a machine decrease the cost of milking, but it gives uniformity in milking.

All cows are milked in the same manner every day, and every good dairy farmer knows this is important and that it is hard to obtain wtih the general run of famr hands.

Reliability of Service

A machine when properly installed and equipped with a reliable source of power is always there ready for work.

Breakdowns are comparatively rare and usually easily remedied.

Wear and tear is not excessive, considering the nature of the machine, and provided the latter is given proper attention.

Effect on Cows

A machine that is properly adjusted and handled will not injure the cow's teats or udder any more than the average farm hand.

Three years' experience of mechanical milkers on the Central Experimental Farm does not show that the cows dry off any more quickly than when milked by hand.

There is no more, if as much, objection to the milking machine on the part of the cows than there is to hand milking.

Old cows used to hand-milking object most, and may not let down their milk readily, but heifers take to machine milking like ducks to water and reuire hardly any stripping.

Stripping by hand after taking the machine off is advocated by all users, as well as makers, as a precautionary and economical measure.

Effect on Quality of Milk

If the machines are properly handled in the barn, and likewise properly washed in the dairy, the milk produced will be as good, or better, than that produced by hand milking.

Where extra pains are taken with the machines and the care of the milk a very high grade of milk can be produced.

Careless handling results in bad milk and ultimate failure of the machine.

Importance of Efficiency in Operation

Last, and of far more importance than the cost price or make of the machine, comes the question of the efficiency of the operator.

Handling the machine is a job for the farmer, his son, or some hired man who has an interest in the success of the machine and the cows.

For best results the operator must be quick and quiet, with an eye for details.

Know the machine and the cows, and adapt the one to suit the other, giving each their proper share of attention at the proper time.

Makes of Machines

Any of the more prominent makes of milking machines upon the market will do good work provided they are properly handled.

The addresses of the dealers or manufacturers of the various machines can be procured from the farm journals, or upon applicaiton to the Animal Husbandry Division, Experimental Farm, Ottawa.

TRADE MARKS FOR FARM PRODUCTS

Ten years ago a farmer friend of mine invented a new style of hand potato digger and promptly obtained a patent on it from the United States Patent Office, which gave him the exclusive right to manufacture the device for a term of years. Today he could buy up half of the farms in our state if he were so inclined.

Another friend of mine, of a literary turn of mind, wrote a novel and obtained a copyright which gave him the exclusive right to print and publish the book. The other day he showed me a royalty check for $3655.

As for myself, I possess neither inventive, mechanical nor literary genius, but I do claim that the butter which I produce on my dairy farm and sell to "the ultimate consumer" in a do en different states for current coin is second to none, better than 99% of the ordinary product, and that it has established an enviable and gilt-edged reputation with the purchasing public. I have frequently been in retail stores in my own and and neighboring states and heard customers inuire for my "Blue Sky Dairy Butter," and refuse to take anything else.

Then it occurred to me that if my mechanical friend could obtain a patent to protect his invention, and if my literary friend could obtain a copyright to protect the product of his brain, there should be some way whereby a plain farmer could obtain something along the same line which would distinguish his goods from others of the same class, and enable him to reap the benefit of the good will and reputation which he has built up by his honesty, skill and industry.

I found that it was possible to do this by means of a trade-mark, and I lost no time in obtaining a trdae-mark for my "Blue Sky Dairy Butter." For the past five years I have been selling my goods under the protection afforded by my trade-mark, and during that time, and when putting the matter through and getting my trade-mark registered, I picked up some information that might be of interest to other farmers who may be considering how they can protect their name and business reputation of their goods.

First of all, if we start with a definition, a trade-mark may be defined as a "name, sign, symbol or device which is attached to goods offered for sale in the market so as to distinguish them from similar goods and to identify them with some trader, as being made, imported, selected, certified or sold by him," and it followed that its function is to indicate the origin or ownership of the goods, to distinguish the goods of one person from those of another, and to enable the producer or manufacturer to reap a commercial return from the standing of his products.

Having determined to adopt a trade-mark, the very first question which presents itself is: What names, signs, symbols, words or devices may be used as a trade-mark?

In this connection, one of the very first rules is that words which are merely descriptive of the goods or business to which they are applied cannot be used as trade-marks, as such words are common property and cannot be appropriated by one person to the exclusion of the rest of the public. As the courts have said: "No one can secure a monopoly upon the adjectives of the language." Such words as "Superfine," "Best," "First Quality," etc., cannot, therefore, be used as trade-marks.

Following out this rule, the courts have held that descriptive words such as "Club" applied to whiskey, "Self-loading" applied to cartridges, "Oriental Cream" applied to a lotion, "Snow-flake" applied to bread, "Carck Proof" applied to rubber goods, and many others of the same class, cannot be used as trade-marks.

The second rule is that a word, etc., which is used in a purely arbitrary or fanciful sense, as applied to the goods in question may constitute a valid trade-mark.

In this connection, such words as "Sunshine" applied to stoves, "Eureka' applied to fertilizer, "Home" applied to sewing machines, "Hoosier" applied to plows, "La Favorita" applied to flour, "Omega" appiled to oil, "Marvel" applied to flour, "Holeproof" applied to hosiery, and many others of the same class are valid trade-marks.

It will be seen that the trade-mark selected by me—"Blue Sky"—in connection with dairy products, is an arbitrary or fanciful word which fullfils the requirements of the above rule.

In view of the above rules, it follows that numbers of, especially used in combination with letters or other devices ,or when printed in a special form or color, may constitute a valid trade-mark, provided that the numbers are not used to indicate the grade, quality, class or description of the goods, and the same applies to letters or initials. For instance, in an English case the court held that "H. H. 6," where the numeral was used to denote the size of the plow-share ssold, was a valid trade-mark.

The names of characters of fiction or mythology, or of the historical persons or things, are also frequently used as trade-marks, and the courts have held that as long as they are not merely descriptive of the quality of the goods, they constitute valid trade-marks.

For instance, "Delsarte" shoes, "Bismark" collars, "Roger Williams" cloth "Coal Oil Johnny" soap, and many others have been held to be valid trade-marks by the American courts.

It follows also that coined or invented words are peculiarly appropriate and valid for trade-marks, unless merely descriptive, such as "Sapolio," "Usea." "Cuticura" Celluloid," etc.

As a merely descriptive word cannot be used as a trade-mark, it follows that geographical terms and other words used to designate a country or a locality canot be used ofr the same purpose, as these words are common property.

For instance, the words "Orient," "Oriental." "Columbia," etc., cannot be used as trade-marks.

I trust that the foregoing brief paragraphs may give some information worth while and, to my mind, the subject deesrves the attention of any live farmer who is producing and marketing a product that has established a reputation, and who wishes to preserve that reputation for his own financial benefit.—Arthur B. Brown, in Maine Farmer.

"HARD SEEDS" CHIEF CAUSE OF LOW GERMINATION

"Hard seeds" often appear in legumes, particularly in alfalfa and sweet, red, white and alsike clovers. So-called "hard seeds" are those which are still hard at the end of a given germination period. This failure is due to hard seed coats that prevent the absorption of water readily. Some of these seeds will remain in the ground or in the water for an indefinite period without germination, yet if the seed coats are scratched or broken germination is usually repaid. The broken seed coats may result from natural agencies such as freezing and thawing when the seed is sown in late fall.

Ae few of the largest seed companies in the United States make scarifying machines a part of their milling equipment. These machines scratch or break the seed coates and thus reduce the number of "hard seeds." However, sacrification is seldom practiced in that it is a tedious and expensive process and because the demand for scarified seed is limited. The additional cost to the consumer ranges from 10 to 15 per cent. of the original value of the seed.

The percentage of hard seeds remaining in the spring if the seed is sown in the late fall will be relatively small. If the seed sown is of the new crop, the perecntage remaining hard represents a smaller loss than the additional cost of sacrificed seed. It is recommended that buyers of the above-named seeds note carefully the percentage of germination on the container label. If the germination is less than 90 per cent, it will be necessary to increase the amount of seed sown, sa most of the seesd which do not germinate are "hard."

PURE SEED MAKES BIG CROPS

Pure live seed helps to make big crops. Even the most fertile soil, the best seed bed and the most careful cultivation will be useless unless pure, live seeds are planted. It is safe to say that with the same acreage and with the same cultural methods, and with the same care in harvesting, the yields of the crops can be increased 10% to 15% by simply giving unusual attention to the use of pure, clean, sound and vigorous seed. Poor seed is often the only cause of crop failur.e Poor seed is largely responsible for weedy farms. Weed control will be useless unless more attention is given to the use of pure seed.

Freight congestion and delays in transportation make it necessary to place orders weeks in advance of the usual time for all farm supplies. This is particularly true of new parts and repairs for farm machinery. Secure them early and put every tool and implement in condition to use when wanted.

HORTICULTURE

THE HOME VEGETABLE GARDEN

First of a series of articles to appear regularly in these columns on the production of vegetables in the home garden of farm, village, town and city.

By A. G. Turney, Provincial Horticulturist for N. B.

The Need for Greter Home Garden Production

The necessity and importance of the home vegetable garden has never been so urgent or marked as it is now. The food supply must ben increased by every means at our command, and city town and village dwellers, can and must help to swell that increase.

The situation is extremely critical. The civil population of France has exactly three day's supply of food. Italy, if anything, is worse off than France. The British Isles are on rations. Unless the people of the North American Continent put every atom of their strength and resouces into an unparallelled and prodigious effort for the attainment of the uttermost production of which they are capable —unless they do this—and do it now —the civilian population of our allies in Europe faces—famine—disease and death; and our own brave Canadian soldiers and those of the United States must bow to the victorious force of the German arms.

We must increase our production and consumption of wholesale vegetables and eat less of the foodstuffs so urgently needed overseas, such as flour, meats and sugar. Here is the opportunity for the garden owner in city, town or village and on the farm. Vegetables should hold a more important place in our daily food for they have much better food and tonic value than their present consumption, in compjarison to that of other foods, would suggest. Vegetables produced in your own garden, because they will be fresh, should be superior to those from the store or the market. Peas and some other vegetables detoriate rapidly after they are picked. Sweet corn loses much of its sugar contents in a day. The best varieties are not alawys obtainable in the stores or market, because some of them are tender, hard to handle, poor shippers and detiorate rapidly. The superiority of home grown vegetables should lead to a greater consumption of them —with a corresponding saving of the foods needed so much for export. Potatoes, carrots, turnips, onions and beans, especially, may be used to advantage more freely in a variety of wholesome, nourishing and palatable dishes, with a consequent saving of flour, meat and dairy products. Individual and concerted effort towards thiis end is an essential contribution to winning the war.

Starting Long Season Vegetables Indoors

There are same factors, such as Essentials of Gardening, Planning the Garden, Varietiies, Seed Supply, etc.., which, ordinarily, should be considered first. But since some of our readers may desire to prepare for some long season vegetables by starting seed indoors—and that start must be made immediately— we must consider that subject at once—and treat of the others later.

Our average garden will contain comparatively few celery and tomato plants, and early cabbage and cauliflower, and they may be bought from the local florists or growers early in June. However, those who wish to do so, may raise their own plants of vegetables by proceeding as follows:

The seed box or flat, which is kept in the house, is the most practical device for the home gardener to use for this purpose. It should be not deeper than three inches, from 12 to 14 inches wide and about 20 to 24 inshes long. Finan Haddie boxes answer the purpose well. Place a layer of about 1 inch of gravel or cinders in the bottom of the box—and then fill to the top with good garden soil. A finer seed bed may be procured by first passing the soil through a small sieve of about ¼ inch mesh. Press the soil down firmly with a small piece of board. Crosswise of the box, mark shallow drills or furrows, ¼ to ½ inch deep, and 2 inches apart. Sow about 8 seeds to the inch in the row and cover nearly level with the surface pressing the soil slightly with the hand to firm it. Celery seed should not covered more than ⅛ inch. Water a little and set in a warm light place, preferably just inside a sunny window. Give water from time to time, enough to keep the soil moist but not wet, but not enough to leak through the box. If the box is in a window, after the plants are up turn the box each day to prevent them growing in one direction towards the light.

When the plants are 1½ inches high hin out to 2 inches apart in the row. This gives them pace enough to make a strong stocky growth. If you want to keep the plants which are thinned out, set them two inches apart each way in similar boxes or "flats." When the tomato plants are 5 or 6 inches high thin out to 4 or 5 inches apart in theflat. The plants thinned out may be set, one each, in berry boxes. Then when finally planted into the garden, the bottom of the box is cut away and the box sunk in the soil in the permanent location. This gives the plants an excellent start as the soil around the roots is not loosened or disturbed. When the cabbage and cauliflower plants begin to crowd again after first thinning out, thin out and transplant again 3½ to 4 inches apart each way. Leave the celery plants at 2 inches apart. Further directions on the after handling of thee plants will appear later.

For the seed, a packet of each vegetable hould be plenty. The following varieties are recommended: Tomatoes —Alacrity or Early Jewel. Cabbage— Early Express or Jersey Kakefield. Caualiflower — Early Snowball or Dwarf Erfurt. Celery—Golden Self Blanching or Perfected White Plume. Brussels Sprouts (handle same as cabbage) Amager Market. Peppers (handle same as tomatoes) Chinese Giant. Get seeds put up by a well known reliable firm. See that the packets are stamped 1918. Celery seed, particluarly, is practically worthless if more than a year old. Label the rows of seed planted with name of variety and date. Approximate time required for germination: Celery, 10 to 20 days. Cabbage and Cauliflower, 5 to 10 days. Pepper, 9 to 14 days. Tomato, 6 to 12 days.

Essentials for Success

The essentials for successful production of vegetables in the small home garden are the same as those required in larger or market gardening operations, with the important exception, however, that more particular attention must be given to intensive order of planting of the different crops, so as to obtain the maximum yield from the limited area under cultivation.

Soil.—Some special crops, such as celery and melons, require particluar types of soil for the attainment of their highest development. Most vegetables, however may be successfullly

Why Europe Makes Bigger Crops Than the United States

Average Production of European Crops is as Follows:		Average Production of American Crops is as Follows:	
Wheat	33 bushels per acre	Wheat	14 bushels per acre
Oats	45 " "	Oats	40 " "
Potatoes	199.84 " "	Potatoes	97.15 " "
Cotton in Egypt..	400 pounds "	Cotton	185 pounds "

Europe uses a Home-Mixed Nitrate Fertilizer containing 8 per cent of Phosphoric Acid and 4½ per cent of Nitrate Nitrogen.

America uses a Fertilizer containing 8 per cent of Phosphoric Acid and 2 per cent of Nitrogen which is mostly unavailable.

The difference in yields is largely due to larger amount of Nitrate Nitrogen used in Europe per acre as **Nitrate of Soda.** Our small American acre yields are due to failure to appreciate this necessity.

Don't Give Your Garden a Holiday

The War Cry of the British Government

The urgent problem of greater production is solved by a combination of good seed and good soil. Make your choice early this year from

DUPUY & FERGUSON 1918 CATALOGUE

and pick a second or third choice in case a favorite brand runs short. Plant your garden patch or farm to full capacity. Dupuy & Ferguson's seeds will give you a maximum crop whether bought by the bushel or the 5c package.

Address all orders to

DUPUY & FERGUSON

38 Jacques Cartier Sq., Montreal

Registered Fertilizers

Analysis Guaranteed

"Best-by-Test" Fertilizers are registered and identified by a number. The analysis is guaranteed by us, and any purchaser is allowed to submit samples for Government examination. If you want any crop to give big returns, feed it Fertilizer. Whatever soil you have, needs some addition to its plant food constituents. If you will tell us the kind of soil and the kind of crop, we will tell you if they are suited to each other, and what kind and how much Fertilizer to use. Write us fully; we shall be glad to help you. Special rates when farmers club together and order in car-load lots. Agents Wanted.

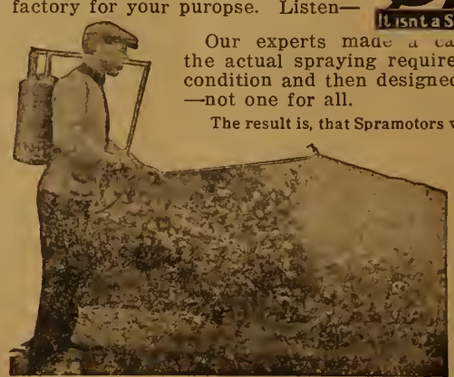
Spraying Insures Profitable Crops

You know that as well as we—no need to argue that point. The only question for you to consider is, which sprayer is the best and most satisfactory for your purpose. Listen—

Spramotor

It isn't a SPRAMOTOR unless we made it.



Our experts made a careful, personal study of the actual spraying requirements for every possible condition and then designed a sprayer for each need —not one for all.

The result is, that Spramotors will give greater satisfaction and longer service in your particular field than any other sprayer you can possibly buy. Made in different styles—both hand and power. Write for free descriptive booklet and treatise on Crop Diseases.

Made in Canada— No Duty to Pay

HAMILTON WINNIPEG

duce earlier crop. A heavy clay soil grown on many different types of soil. It is fortunate that such is the case. for it makes possible the production of vegetables for home use in almost every locality where there is any soil at all suitable for agricultural purposes. Good results may be obtained on any fairly fertile soil. but sandy and clay loams enriched with manure are ideal. Light sand with plenty of manure will give good results and pro- is not desirable because if it is worked when too wet it will bake badly and form clods. Lime at the rate of ¾ to one pound to every ten square feet in the garden will greatly improve such a soil; and also the addition of a heavy dressing of well rotted table manure to be well mixed through the first foot of soil.

Water Supply anl Drainage.—In this province nature has provided sufficient water throughout the growing season to take into solution the plant food of the soil for absorptoin by the fine root hairs of the plants. The problem is not one of irrigation, (although in hot or dry weather water may be applied with considerable benefit), but one of drainage. Good drainage is essential, and after it is assured the more level the ground is the more convenient for working.

Air Drainage.—It should be borne in mind that frost is less likely to injure vegetables growing on high ground than those growing on high places or valleys or cups into which the cold air, which is heavier than warm air, generally settles.

Sunlight.—No amount of fertilizer watering or cultivation will take the place of sunlight. In planning the garden this factor must be recognized and consideration given to the time per day that any part of the garden is shadowed by fences, buildings, trees anad shrubs. To be successful most of the garden must receive a daily average of, at least, five hours of sunlight. Foilage crops, such as Lettuce, and Spinach, will stand more shadow. but even these require from two to three hours of sunshine per day. Such plants as the tomato and pepper and those which have fruits to ripen should be placed in the sunniest spots.

With many small home gardens there is little or no opportunity for choosing location and exposure, the exact position of the garden being already determined by the restriction of buildings, size of lot, etc. In such a case the owner must plan to make the best use of its adaptations by tudying them in their relation to the requirements of the different crops, and growing onl those which offer the best chance of success. There, however, a certain amount of choice may be exercised, the location and exposure of the garden hould be based on the factors dealt with above.

Cultivation.—Good cultivation is essential to success, and it will be dealt with in subsequent articles on the preparation of the soil and cultural direction for each crop.

Good Seed of Right Varieties.—Seed should be ordered or obtained well in advance of the actual dates for sowing. One is more likely to get good seed by ordering early. Some seeds lose their vitality after a year or two, and old seed as a rule should not be relied on. Buy seeds put up by a reliable seed house and see that all packets of seed are stamped 1918, and that seeds bought in larger quantities are of 1917 production. Do not put your faith in new varieties for which great things are so attractively claimed by some seed firms—but select a varieties recommended by local growers becuse of their proved worth and suitability for local conditions.

Planning the Garden

There are three types of home vegetable garden: (1) The farmer's garden, (2) th evillage, small town or surburban garden, (3) the city garden.

There is generally plenty of land available for the farmer's garden and hence no restriction on the assortment of vegetables or the space to be alloted to them. Planting should be made in long rows with ample space between them so that horse cultivation may be used as much as possible. In the farmers' garden the main point is to reduce the hand labor to a minimum, for labor is more expensive to the farmer than space. For the present we will have to leave a further consideration of the farmers' garden and considerable problems of the smaller gardens.

The village or surburban garden often presents conditions very diifferent from those of the farm. The space is more limited so that the vegetablse must be planted closer together and all cultivation done by hand, and it is often adivsable to omit certain vegetables that require a large amount of space.

The backyard of the city calls for more extensive methods and usually presents greater difficulties. However, limitations of space, and poorness of soil, may be offset to some extent by the availibilty of water and opportunity for improving the soil by addition of lime and manure.

In orIder to obtain the best results every foot of our small garden should be kept constantly in crop, if possible. This may only be accomplished by making a definite plan of the garden some weeks before spring opens. By laying out the garden on paper in this way much time will be saved, mistakes will be avoided, and better all round results may be secured. Make the plan on strong paper that will stand frequent handling and use outdoors. Draw it on a fairly large scale, inch to 4 ft. is suggested, so as to leave room for notes and dates of planting for each crop.

The following points should be considered in deciding on the position of each crop in the garden. These points are applicable to all three types of gardens, paritcularly to the small one.

Permanent or perennial plants, such as Asparagus, Rhubarb and small fruits, should be located along one side or end. Small plants such as beets, carrots, lettuce, parsnips, etc., which need much the same treatment and only small spaces between the drills, should be grouped in adjacent rows. If the vegetables are grouped in this manner according to their cultural requirements, then each group may be planted and tended as one crop and the operations will be much simplified. Tall growing plents giving

DAIRYING.

MILK RETURNS FROM A SHORTHORN HERD

The production of the registered Shorthorn Herd at the Experimental Station, Kentville, N. S., as set forth in the following table, would indicate that profitable returns may be had from such stock for dairy purposes. The aim has been to breed the cows as early as possible after freshening, having in view the getting of a calf every year, but this is impossible because of some cows failing to breed early, due principally to a faulty sire. The dry period has averaged 74 days, the cows milking 304 days and making 378 days between calving.

In the case of Louisa May 2nd, it has been impossible to keep her milking more than six months. It will be noticed she is a good producer when milking, but her long dry period has made her unprofitable. Burnbrae Fairy, on the other hand, is a persistent milker but low producer, turning slight profit only. Outside of these two cows, the herd, for 24 lactation periods gave a profit of $41.75 for each.

HERD RECORD FOR LACTATION PERIOD COMPLETED

NAME	No. of days dry	No. of days milking	Total yield of milk	Average milk per day	Pounds butter produced	Value of butter and skim milk	Cost of feed from calving to calving	Profit
Average From Cows Completing Four Lactation Periods

Average for 32 lacation periods	74	304	5627	18½	272	110.42	74.79	35.63

As the stock is all sold or kept for breeding purposes, it is thought that their value and the manure more than often offsets the cost of labor. The cows are charged for all food consumed between periods of calving.

The value of the butter is based on the wholesale price of butter sold by the Acadia Dairy Company. The value of the skim milk ranged from 20 to 30 cents per hundred. Much of the milk and cream sold for household use, and, if figured on that basis, the profits would be considerably greater.

The meal ration in 1913 was made up of 400 pounds bran, 200 pounds crushed oats, 100 lbs. cottonseed meal, 100 pounds oilcake meal and 100 pounds cornmeal. In 1914, 400 pounds bran, 200 pounds crushed oats, 150 pounds cottonseed meal, 100 pounds ailcake meal and 150 pounds middlings. In 1915, 400 younds bran, 400 pounds crushed oats, 200 pounds cottonseed meal and 200 pounds oilcake meal, and the same in 1916 and 1917. The practice has been to feed the meal raiton according to quantity of milk produced, using one pound to from 3 to 4 pounds of milk, which is considered good dairy practice. The pasturage is poor and one pound is allowed during part of the summer to each 4 pounds of milk produced. During winter 1 pound is given to each 3 pounds of milk. The succulent feed is either ensilage or roots and averages 50 pounds per day. The hay fed amounts to 12 pounds per day. The cost of feed for the whole period stated above has averaged 20 cents per day. The average cost per day at present prices is approximately 30 cents.

These shorthorns are of Scotch foundation blood, eslected as representing a good type of farmer's shorthorns, showing indications of fair milk production, combined with good beef conformation. Visitors invariably express the opinion that the cows are too fat to give milk. The fact is that if fed according to the usual dairy standard they will continue fat, and the reason why so many shorthorns tare poor producers may, in part, be because they have not been fed to their requirements for milk production.

MILKING MACHINES ARE EASIER ON COWS THAN THE AVERAGE HAND MILKER

When any new invention comes up the general tendency is to look upon it with suspicion and regard it as being not quite so good as the old method. For years I was so inclined with the milking machine, and being more or less of a crank on clean hand milking, I hesitated about getting enthusiastic over mechanical milkinig. So many of my dairy friends, however, reported good results from their machines that I finally installed an outfit for milking my cows by machinery.

While I am not so enthused as some appear to be I have no occasion to regret the investment. It does the work when properly handled and does a better job of milking than does the average hired man. It saves considerable time, solves the labor problem in a large measure and I believe is a profitable investment.

My outfit consists of three units which milks three cows at a time. One man can keep it going and strip at the same time, but it is better to have two men—one to strip and one to change the machines. In the busy season when the men are needed in the field one man looks after the milking and other chores.

An objectionable feature of milking machines is that they do not milk all the cows completely dry. They milk some of the cows as dry as one can do by hand, while with others they leave a quart or more. The after-stripping is done quickly, however, and can be arranged to come between changes of a unit from one cow to another. The stripping might be a good thing, because it keeps one in close touch with the conditions of the udders, which otherwise might be overlooked if one did not have to work with them. A congestion is caught in time often can be prevented, and hand stripping after the machine is about the only way to detect an irregularity.

One has much to learn after buying a milking machine, in which respect it is something ilke your first experience with the automobile. Until the little details of runnning a car are mastered one is apt to be pretty much disgusted with it, but after you are

Don't Sell Your Cows

THE increasing shortage of hired men is forcing many farmers to seriously consider selling their herds as they cannot get the time nor labor to milk them.

To sell now is similar to "killing the goose that laid the golden egg"—for never in the history of farming have the prices of milk and cream been higher, nor the necessity of their production so vital to the Empire's needs.

Your herd is a source of rapid growth in your yearly income—a source of rapid increase in productive value of your land itself. Why cut off that income and increased productivity, when you can save it and get better results from your cows?

EMPIRE MILKING MACHINES

have solved the problem of saving time and labor in milking—and have freed the hired man for work in the fields.

Mr. J. H. Grisdale, B. Agr., Director of Dominion Experimental Farm says: The real drudgery of the dairy farm is eliminated by the use of the milking machine. ONE man with a milking machine can do the work of three hand milkers in the same length of time. They take the place of the extra hired men so hard to obtain at this time and are recognized as a good investment.

The most exacting tests by Experimental Farms and Stations prove that Empire Machines milk without injury to the cow, with speed, ease, economy and thoroughness. Cows and heifers take readily to being milked by an Empire Milking Machine and benefit by it. An Empire will save money for you in labor and soon pays for itself. Space prohibits giving full information about this labor saver; Our booklets, however, have the whole story and valuable testimonials from other dairymen just like yourself. Write us for them.

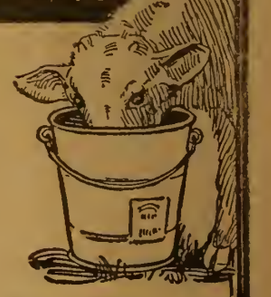
The Feed for Hungry Calves



Conserve the milk and help the nation. You do not need to feed milk to your calves if you use Royal Purple Calf Meal. It is a perfect substitute for milk. It is partially cooked, and the pure ingredients are so combined that the meal will not injure or derange the digestive organs of even the youngest calf. If you want rapid development and healthy calves, feed

Royal Purple Calf Meal

Let the following unsolicited testimonial letters convince you of the sterling qualities of our calf meal.

John D. Hamilton, Port Hope, Ont., writes:
"I have used Royal Purple Calf Meal and find it perfectly satisfactory, and I am recommending to my friends. I might add that I find no trouble with the calves scouring while using this meal. I have tried many other Calf meals, but never found one that proved satisfactory until I got Royal Purple."

S. M. Osborne, Maxwell, Ont., writes:
"We have a pretty good calf which is now four months old and weighs 400 lbs. I think your calf meal is fine. I have never fed anything that will make a calf grow as fast as this meal."

Order Royal Purple from your feedman. It is sold in 25, 50 and 100-lb. bags.

FREE BOOK

Send for our 80-page book which tells how to raise calves without milk. It also describes fully the common diseases of stock and poultry.

familiar with its ins and outs you would not do without it. Likewise it requires some time and patience ti get accustomed to the milking machine. Experience is the only guide in choosing the proper size teat cups for certain cows and in getting them on so they will stay. It is impracticable to try to milk some cows with the milking machine on account of the shape of their teats. With such cows, unless there is some especially good reason for keeping them, I have found the best policy is to sell them to some one who milks by hand. In buying cows one also must keep in mind whether the teatts are adapted to machine milking.

Cows Do Not Object

I have yet to find the cow which objects to the milking machine. It is easier to them than is hand milking. I have one heifer in particular which kicks when milked by hand. With the machine attached she is as gentle as any cow in the stable. She happens to be one of the few which the machine milks completely dry, a fact which I and those who have tried to milk her by hand surely appreciate. Cows do not seem to make any fuss about machine milking even at the start. The only time they seem inclined to stey around or kick is when the cups are left on too long. For this reason one has to keep pretty close tab on each unit and familiariize himself with the approximate time required to milk each cow. I have found a few cows which would not give their milk down even though the cups be left on 15 or 20 minutes. Such cows had better be sold unless they are especially heavy producers.

My observation has been that a cow milked by machinery will give as much milk in lactation period as if milked by hand. Some claim the average cow milked by the average man will produce more milk with the machine for the simple reason that you are apt to get it all in more complete strippings after the machine. The average milker is inclined to leave the last pnt ior quart in the udder if he milks a cow by hand. The machine gets what he ordinarily does and when he strips he gets what he otherwise would leave in the udder. I belive if it were possible to keep exact records under similar cnoditions that the machine-milked cow would have the best of the argument.

Machine milking is a sanitary process if the cups and rubber parts are kept clean. The milk is not exposed to stable dust, but goes direct through a rubber tube into a covered pail from the teat. The only chance for stable dirt getting into the milk is when the teat cups drop off and praticles of diirt from the floor are sucked into the pail. The milking machine parts are very casily kept clean. The tinware is washed in the same manner as the separator and regular dairy apparatus. The rubber parts are first washed in warm water containing an alkali washing soda and then kept immersed in a crock or other container full of a special disinfecting solution recommended by the milking machine company. With this preparation one should have no trouble with sour milk even in the hottest weather. Unless properly cared for however, the teat cups and connecting tubes will become foul and cause trouble.

For some reason hard to explain most hired men object to milking and I have found that the milking machine eliminates much of this objection. Those who do not like to milk by hand often have no objection at all to using the machine. This is especially true in hot weather when the flies are bad. With the machine one can milk almost any number of cows without becoming fatigued. With two men handling a three-unit machine very little time would be saved over hand milking, but with one man operating it he would milk as rapidly as could two men by hand. In the busy season this saving of a hand for the field is no small consideration in favor of the milking machine.

It seems to me that the milking machine can do its part in the conservation of labor during the next year or two of war times. Many of the farm boys will be called to the front and ways must be studied out to do as much o more than was done before with them. In the field labor-saving machinery enabling one man to do the work of two or three will help solve the problem and in the barn the milking machine can bring about the same results. They have passer the experimental stage and there is too much evidence both from agricultural colleges and practical dairymen in their favor to doubt their practicability. A milking machine will save labor and pay fro itself while it is doing it—W. J. Lawrence in O. V. J.

Save Butter-Fat, Time and Labor for Yourself and for the Empire with a

NEW DE LAVAL CREAM SEPARATOR

Save for Yourself Butter-fat right now is selling at the highest price in many years and you can't afford to waste an ounce of it.

Whether you are trying to get along without any cream separator or using an inferior or half-worn-out machine, you are losing valuable butter-fat that would soon pay for a New De Laval.

The De Laval is not only a cream saver but a time and labor saver, and with the present shortage of farm help every farmer needs to utilize time and labor saving machinery wherever it is possible to do so.

Save for the Empire It is the patriotic duty of every cow owner to save butter-fat. We are a nation at war, and not a particle of fat should be wasted. When all Europeana countries are encouraging the use of the best cream separator, can we do less?

Buy Your DeLaval Now Railway delays are so serious that deliveries can't be depended upon, and if you don't order your De Laval early there is no telling when you can get it. Then, too, labor and material conditions may compel higher prices. The sooner you get a De Laval saving butter-fat and labor for yourself and the Empire, the sooner will it pay for itself.

If you haven't the spare cash right now, that need not stand in the way of your getting a New De Laval at once. We have an arrangement with De Laval agents which makes it possible for any reputable farmer to secure a De Laval on the partial payment plan—a small payment at the time of purchase and the balance in several installments so that your De Laval will actually pay for itself while you are using it and getting the benefit from it.

Why not see the nearest DeLaval agent at once? If you do not know him, write to the nearest office for new catalog or any desired information.

SUNLIGHT IN HOG HOUSES

In planning a hog house it is well to bear in mind the natural habits of pigs as they run wild and to give the animals every opportunity to live naturally. The wild hog lives where he can find shade in summer, a dry place to sleep and open fields for grazing. He is a healthy animal.

A warm, dry nest is one thing he is particular about This idea should be copied in building hog houses for domesticated animals, if we are to have conditions as nearly natural as possibile and retain in our hogs the vigor and health of the wild animals.

In having warm, dry pens an abundance of sunlight is of first importance. Let sunshine fall on the floor, dampness is dried off and warmth brought where the hog is. The hog lives directly on the floor—he cannot be up where the warm air in the pen rises. We all know that in a room otherwise warm our feet may be cold—the layer of air on the bottom is not warm. It is in the lower layer of air in the pen that the pig lives, and the more sunlight striking there, the better off is the pig. Have you ever noticed on cold days how the house cat lies on the sunny side of the floor, and how she moves along to keep in it as it moves? Sunlight furnishres much warmth, especially where it strikes direct.

Keep Pens Dry

Sunlight helps not only in keeping a pen warm but in keeping it dry. Dampness and hogs do not go well together. It is better to have a pen cold, provided it is dry and there are no drafts, than to have it warm and wet. In fact, a high degree of warmth is not necessary in a hog pen, except at the time a sow is farrowing—and then it should not be hot. But dryness is essential at all times. If plenty of sunlight can get in it will help greatly in keeping pens dry.

A Good Disinfectant

Sunlight is a disinfectant, one of the best. It is death to disease germs. Commercial disinfectants are good, but do not overlook the value of sunlight for the same purpose. It is just as good an investment to spend money for window glass in a hog house as it is to spend it for dip, considering only the cleansing of the pens of disease germs. And in addition, sunshine does many things which disinfectants cannot do. Use them for their purpose—but use the sunlight, too.

The sun gives vitality to the growing pigs. A few hours in the sunshine tones up a litter as nothing else cana, for it is a source of life, an essential to health.

Plenty of windows in the hog house are a necessity. Hogs seek the sunshine instinctively, except on hot days. To deprive them of it means loss o their owner.

LOVER OF GOOD LIVE STOCK STUDIES NEED OF ANIMALS

Among our agricultural pursuits dairying holds first place from the standpoint of the necessity for a broad scientfic agricultural education. It also ranks high as a remunerative industry when conducted on business principles and with the proper class of cows.

Of the different branches of agriculture dairying is best cauculated to keep up the fertility of the soil, to bring in the most continuous and least variable remuneration, to give steady employment the year around, to stimulate and develop a deep and intellectual investigation in one's work, to till the soil skilfully, select carefully the best varieties of seed, to watch the growth of plants, harvest crops safely, to breed and rear the calves, to have these young animals develop into fine heifers and later into into splendid milking cows, to study their needs, to combine the home grown fooder with the more concentrated bought feeds so as to obtain the best results, and to delve into the mystery of how the cow cna take this food and manufacture the same into creamy white, life-giving milk.

Is not my contention true that a man who successfully carires on a dairy farm is on the top rung of the ladder of agricultural achievement? The man who is a lover of good stock and studies the needs of his animals is ever the man who succeeds.

There is on use entering the dairy business unless there is a natural liking for the cow, and a keen desire to help her do her best. After all much depends upon the man. It pays in more than one way to be on friendly terms with the heifer. You must pet and talk to her, so as to gain her confidence and affection.

Place her early with the herd of milk cows and watch that no harm befalls her. A sudden fright from a dog or an unusual sight may cause her to lose her calf. Go through the process of milking her to accustom her to being handled. See that the calf is removed unknown to her twenty-four hours after birth. Go into the stall soon after the calf is taken away and groom her and if she gets the idea that your are her baby so much the better for the milk pail.

The heifer's udder is swollen and inflamed for a few days after calving. She is nervous and exicted. If you have been in ithe habit of handling her she will will allow you to gently rub her udder and draw a little milk. The relief thus given will further install you in her affections, and her last thought would be to lift a foot to kick you.

The kicking cow is not born, she is made that way by her milker. To get gentle cows there is nothing like raising them yourself. The cow seems to acquire the diposition of her keeper. No dairyman can afford to have a man in his stable who is rough and quick tempered.

If the heifer is thrifty and strong she may have her first calf from two to two and a half years old. If delayed longer she is apt to acquire the habit of putting her food into flesh.

If you wish to establish a long milking propensity you must be careful when milking after the first calf. It is then that the habit of a long or short milking period is formed. Dry her up at seven or eight months and it is difficult ever after to get her to milk for ten months. For this reason keep on milking her for ten or eleven months no matter how little milk you may get.

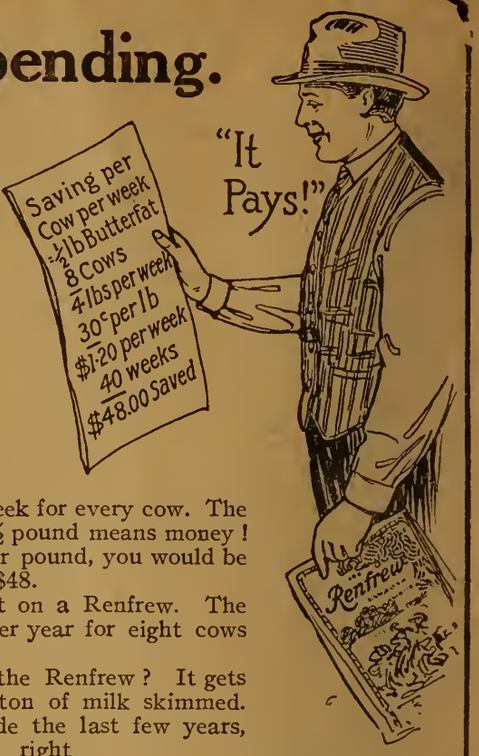
It is better to have the heavy flow of milk in winter, when prices are higher and help more plentiful. Cows in November and December g on grass just when there is a tendency to a falling off in the milk flow. The change to fresh pasture stimulates the scretion of milk and it is like a second freshening.

Fall calving is better for the cow and the calf. They receive better care and are not so exposed to extremes of weather.

It must be remembered that a cow must not be neglected when dry. That is he rbuilding up period, and she should get plenty of good food and be in a vigorous condition at freshening time.

Saving Money by Spending.

"SAVING" money by continuing to use an inferior machine is like "saving at the spigot and wasting at the bung." For instance, if your machine skims down to .1 per cent. for every thousand pounds of milk skimmed, compare that result with the splendid, proven record of the Renfrew. You find by having the

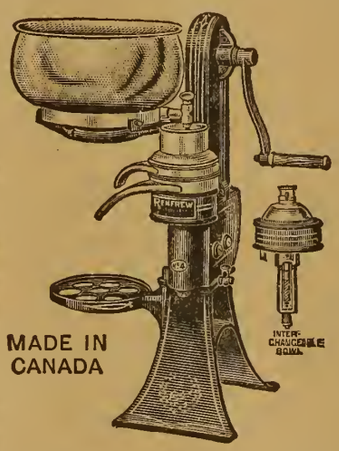


Renfrew

that you will save about ½ pound of butter-fat per week for every cow. The Renfrew skims down to .01 per cent. That loss of ½ pound means money! With eight cows, and butter-fat at say 30 cents per pound, you would be losing every year (40 weeks' milking) the tidy sum of $48.

This sum saved is accepted by us as a first payment on a Renfrew. The saving soon pays for the machine—and then the $48 per year for eight cows becomes extra profit.

Will it not pay you to discard the old machine for the Renfrew? It gets all but the last three ounces of butter-fat in a whole ton of milk skimmed. If you could reckon the losses the old machine made the last few years, wouldn't it decide you right away to get the close-skimming Renfrew?



Our illustrated booklet gives interesting proofs of the Renfrew's close skimming, including tests by Government Dairy Schools. It also explains the Renfrew's self-oiling system, the interchangeable capacity feature, easy-to-clean advantages, etc. Send for booklet to-day.

Other Lines: **Renfrew Kerosene Engine, Happy Farmer Tractors, Farmers' 2000 lb. Truck Scale.**

NOTICE.—The Renfrew Separator illustrated here was formerly sold under the name "Standard," which identified it as a high efficiency cream separator. The name "Renfrew" has been used on the same machine for several years for our United States and foreign trade and under that name has become as popular in those markets as under the name "Standard" in Canada. Now the name "Renfrew" has been adopted for Canada so as to link the name more closely with that of our company and so that we can sell the machine under a uniform name throughout the world.

FARMERS AND BREEDERS

Who wish to keep their horses and cattle strong and healthy, should always have on hand a supply of

OMAZON

The Canadian medicinal stock food for Horses, Cattle, Sheep, Hogs and Poultry.

It will help to economize on feed and owing to its sovereign tonic and curative virtues will keep the stock strong, healthy and free from many ailments.

Order from your dealer. If he hasn't it in hand, he will be pleased to obtain it for you.

DR. ED. MORIN & CO., Limited, Quebec, Can.

BUILD THE BARN OF BISHOPRIC STUCCO BOARD

First of all there is a clear saving of at least 25% in time and money, compared with lumber and sheathing paper.

(A good many farmers have proved this. We'll send you their names and addresses if you wish—and you can write them),

WARM AND DRY

Bishopric Stucco Board makes a warmer and dryer barn than you can possibly get with ordinary boards. Because it is made of asphalt mastic, reinforced with kiln-dried laths. This gives a surface absolutely proof against wind and dampness, rats and vermin.

FOR

CATTLE, GRAIN AND POULTRY

Bishopric Stucco Board makes the ideal Barn, Stable, Poultry House and Grain Storage. It costs less, gives better service, and is so much easier to put up.

Write for our booklet, describing it in detail, with many illustrations showing Bishopric Products in actual use.

BISHOPRIC WALL BOARD CO.

88

Children or weak handed persons should never milk good cows. They have not the strength in their hands to press the teats hard enough to excite the nerves sufficiently to get all the milk. Poor milkers the too often the cause of the cows not filling the pail as the yshrould.

Did you ever think why the calf beats its mother while getting its milk? The milk was not coming fast enough to suit the little animal and instinct t aught it that by giving a bunt or two the nerves were excited and milk came quicker.

Some milkers may take a lesson from the calf and instead of trying to get the udder as well as the milk into the pail let them press upward instead of pulling downward so hard. The udder is less likely to become injured or unshapely. If either the fore or back portion of the udder is poorly developed, milk that part first in the hope of stimulating the nerves and overcoming to some extent the deficiency.

Alwaas milk the cows in the same order. If you milk Spotty first tonight go to her first next morning. She may get cranky and hold up her milk if you pass her and go to Maffie.

Milk as nearly as you can at the same hour, having equal distances of time between milkings. Cows get accustomed to a milker and it is better for the same person to milk the same cows. Some cows are so particular in this respect that they refuse to give their milk to a stranger. Milking should b edone quietly and vigorously throughout the entire process.

There is no more effectual way of drying up a cow than leaving a little milk in her udder; besides it pays to get it all, for the last drawn milk contains as high as from ten to twelve per cent. fat while the first only about two per cent.

The day has forever passed when th eprogressive dairyman allows his cows to be brought running in the stable by a dog or a boy with a whip. Harsh treatment. chilly winds, cold rains, worrying flies, in fact anything that excltes, irritates, or brings discomfort to the cow decreases very materailly her proltableness. A cow should soon learn that her keeper is her best friend. Speak to her in a kind voice and pet her. If you are milking her and she steps on your foot d onot give her a knock. She did not know just where your foot was or how big it was.

Learn to govern your temper; it will bring dollars into your pocketbook. If you abuse a cow she will get even with you. You say the ugly old thing is holding up her milk but how often is it the case that you were ill-natured? It is not well to let the cow form the habit of eating while being milked. If they become accustomed to being fed at that time they will not let their milk down as well if the food is withheld. But even if from the first they are milked before the feeding, they do as well, and it is better for the milk, as there is less food odor and less dust in the stable.

Exposure on cold days or nights results in a decreased milk flow and general lack of thrift showing by the starin coat and a poorly nourished calf. Cows must be kept comfortable at all times. Lying on the cold wet ground is certainly injurious to the highly developed mammary organs, which are very sensitive to the weather canges.

Remember to take good care of the cow and your bank acocunt will grow. Good, better, best, and let us have no rest until the good has been made better, and the better made best.

"EVERY FARM SHOULD HAVE AN AYRSHIRE"

W. F. STEPHEN, Secretary
Canadian Ayrshire Breeders' Association
Box 504 Huntington, Que

KEEPING BREEDING RECORDS ON FARM

The job of keeping breeding records is one that most of us farmers find trying. The simplest and most efficient method is trouble enough. A system that the writer finds very convenient is to use a desk calendar or a memorandum file as they are sometimes called, like a city business man uses to remind him of his appointments. The date of breeding can be set down on the day bred. Then all that is necessary is to add the number of days in the gestation period of the animal to the number of the day, the year of the day bred, and the sum obtained will be the number of the day of the year on which the gestation period should end. For example, a sow is bred n January 3. The number of days in the gestation period ofa sow is 112. January 3 is the third day of the year. Add 112 to three and we have 115. Turn the leaves of the calendar to 115 and we find the 115th day falls on April 25. That is the date the new born pigs should arrive.

It is a good plan to indicate on a page of the calendar a week or ten days previous the fact that such and such an animal should be expecting a birthday party in so many days. Then when this warning page comes up your attnetion will be called to the fact and preparation can be made in time. Your presence in the hog house at the proper time may help to save several piglets that might get lost and chilled or crusbed heneath the sow.

A calendar like the one mentioned can be procured from any city station-er if they are not to be had in your country town. One should be sure that the calendar has the number of the day ol the year on each page. I

"The man you can hire to work on a farm for nothing will just about earn his wages"—*Josh Billings*

IT'S the same with cheap farm engines as with cheap farm help. You can buy a poorly designed, cheaply made engine for less than the price of an Alpha, but you will find that a cheap engine is always "balking" or getting out of kilter just when you need it most.

And there will be endless expense for repairs.

You will practice real economy by buying an

ALPHA GAS ENGINE

which runs along, day after day, without giving you any trouble. You can always depend on the Alpha.

In the Alpha there are none of the trouble-making contrivances that render so many "farm" engines impracticable. It contains no delicate electric batteries, but runs on a simple, low-speed magneto, guaranteed for the life of the engine.

Alpha Gas Engines are made in twelve sizes, 1½ to 28 H. P., and each size is furnished in stationary, semi-portable or portable style, with hopper or tank-cooled cylinder. Write or call up the nearest Alpha selling agency today, or if you don't know who they are, write us direct.

ROYAL PURPLE
Stock Specific
This popular animal regulator and fattener is being fed to stock in thousands of stables every day during the winter. It is good for cows, steers, horses, sheep and swine. It tones up the entire system by improving digestion, and purifying the blood. Maximum nourishment is obtained from all food eaten when our Stock Specific is fed regularly.
Cows Give More Milk
Dairymen state positively that their cows give from one-quarter to a half gallon more milk each, daily, when fed Royal Purple Stock Specific. Think how you would benefit by its use if milking only a small herd.
It rapidly improves the condition of hide-bound horses, and enables you to fatten hogs in from three to five weeks less time than you would otherwise require. Give it a trial.
Feedmen everywhere carry it in large and small packages. Ask for our 80-page booklet.

THE HORSE

LACK OF HOOF CARE IN THE WINTER MAKES THOUSANDS OF COLTS GOOD FOR NOTHING

The foot of the horse is one of the most important regions of study, and one of the most important parts of his anatomy that require special attention during the winter months. "A man is as old as his arteries and a horse as old as his feet and legs." Winter neglect of the young colt's hoof reduces his value, and takes years off his life. In some cases a colt is practically ruined for life for want of intelligent attention to its feet during the first winter.

When running with its dam, the wear of the wall of the hoof at the bottom is about equal to the growth at the top, hence the feet remain the same size and shape. But when brought into the stable for winter, the wear becomes much less than the growth. Hence the feet become deep at the heels, and long at the toes. The walls of the heel, after having grown downward below the frog, have a tendency to bend or curl inwards, the bars not being sufficiently strong to prevent it.

The Hoof of the Foal

The care of the foot should begin with the foal. There are many farmers who consider that the foot of the youngster can look after itself, and they give it no attention until the animal is harnessed at three years of age. No greater mistake can be made in rearing horses. It is during these three years that it is possible to cultivate a good foot, and to correct errors in conformation of the limbs, and not afterwards. The unshod foot should be trimmed every month. The heels of the young colts have a tendency to curl inwards, and if left alone may produce contracted foot. The chief object is to get them to spring, and to slope nicely outwards. Early trimming will bring about what is desired. The heels especially should be reduced until the bars and frog are pressing on the ground. The toe has a tendency to grow too long, thus throwing too much stress on the back tendons. It must be shortened, but not as much as to produce a stumpy appearance in the foot. The colt's foot should be trimmen in this way every month, and it must be remembered that it is absolutely prohibitive to cut the sole, frog or bars. This is all the attention that is necessary for the fullest development of a good foot, in an animal with limbs straight and well formed and moves straight and close.

Cultivating Its Weight Carrying Parts Equally

Unfortunately many foals are born with limbs far from being straight and perfect. It is often possible to improve defective limbs by early attention and shoeing. In a youngster going wide, a common fault in foals and mature horses alike, the outer side of the column of bones of the limb is longer than the inner, and hence causes the limb to bulge outwards. Greater pressure is exerted on the outer wall of the foot, which wears away, while the inner wall grows too long and soon the foot gets mis-shapen. Such a foot will prevent the limbs from assuming their natural direction. In such a case the inner wall should be cut down, the toe shortened and the outer wall allowed to grow long. The inner side of the frog may also require to be lowered so as to allow the inner wall to come to the ground.

Breeders of the best horses always recognize that the foot is the foundation of the animal. Many a youngster comes into their stud, not too well fixed for shapely feet or legs. This fault does not give the breeder much worry, as he knows that if there is a good coronet, and good quality of horn in hoof, a little study, care and attention to cultivate the foot will bring the graceful carriage and close hock formation that are the outstanding signs of uality in a Clyde or heavy drafter.

The Structure of the Hoof

A brief study of the hoof, and a familiarity with the different parts and their functions will help to simplify the work in keeping the young colt's hoof in proper condition and shape.

The coronet is the upper limit of the hoof between the quick and the skin of the limb. It is from here that the wall of the hoof is secreted. Around the coronet is also situated a ring which secrets a varnish named peripole, which covers the outside surface of the hoof, and prevents evaporation from drying up the hoof. This varnish should never be rasped off in the proeess of shoeing.

The hoof is simply modified skin

Dr. J. Woodbury's Horse Liniment

THE INFALLIBLE REMEDY

For the removal of Splints, Bog Spavins, enlargements of any and every description it has no equal. Given internally, it will promptly relieve and remove any and every character of Cough Enlargements of the Glands, Affections of the Kidneys. Yarmouth, N.S.

modified to resist the excessive wear imposed on it, and is composed of four parts; the wall, bars, sole and frog. The wall is the part visible when the foot is on the ground, and it is divided into three parts, the toe, quarters and heels. It is longest and thickest at the toe, and shortest and thinnest at the heels, where expansion occurs. This wall does not terminate at the heels, but is reflected inwards, terminating at the apex of the frog. These reflected portions are called bars. Th ebars act as weight carriers, and in a good foot must be strong and well developed. The sole of the hoof is concave, and especially so in the hind feet. It is not intended to carry weight, except at the outer edge where it joins the wall. That junction is marked by a white line noticeable in the newly dressed hoof.

The frog is the triangular, elastic pad between the bars and behind the sole. In the centre, and at either side, there is a deep cleft. In a good foot the frog should project beyond the wall, and in both shod and unshod hoofs it should always come in contact with the ground and bear weight.

The Growth of the Hoof

The growth of the hoof is influenced by many conditions that are under the control of the caretaker. In grows faster than in diseased and badly nourished ones. It is more active in growth in warm weather than in cold, and the unshod hoof grows more quickly than the shod. The parallel rings that are seen round the surface of the hoof show that the animal has been in somewhat irregular health, or has passed through alternate periods of neglect and rightful attention. The wall of the hoof grows from the coronet all the way round at the rate of about half an inch per month. It takes fully a year to be renewed at the toe, five or six months at the quarters, and three to four months at the heels.

For diseased, brittle feet, a hoof ointment is very useful. Liquid tar, bees war, honey and glycerine, of each an ounce, lanoline and vaseline, three ounces each, is a useful preparation.

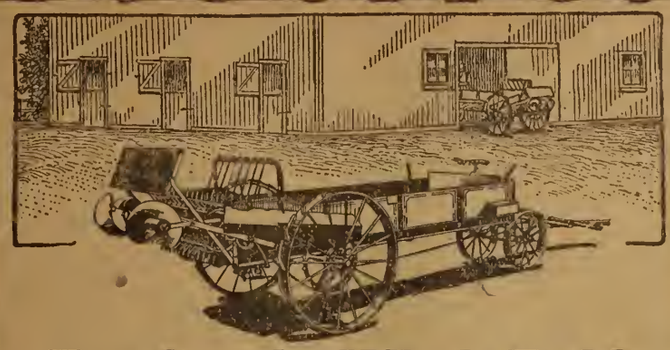
The growth of the hoof can be stimulated by repeated mild blistering around the coronet. This encourages the growth of the hair likewise, which is one of the points in a good Clyde. Liquid cantharides is a very useful preparation for this purpose and should be rubbed into each coronet for about three minutes. The most marked effect of blistering young colts of two or three years of age is observed in the spring time. Let one month elapse between blistering and anoint the parts daily with a non-irritating oil. The young foals, before weaning time, should not be blistered. Soft soap, well rubbed in, will be sufficient to encourage the growth of hair and hoof around their coronets.

Not one farmer in a thousand ever seriously thinks over the winter condition of the young colt in regard to healthy growth of hoof. Lack of opportunity for exercise on hard ground must be supplemented by artificial methods. Hot manure all night in the box stall and soft snow all day are about the worst conditions imaginable for the hoof and this, is the fate of the young colt in winter. Carefully cultivate the young hoof, and watch its growth in winter, and you will find reward in the mature horse. A little interest and care in winter will go a long way to place the horse breeding industry of Canada on a better "footing."

CARE OF MARES BEFORE FOALING

Carelessness and lack of knowledge are responsible for a large number of losses which occur during foaling. This s doubly true because in case of trouble, aid must be given quickly and accurately. The loss of foals before weaning time has been estimated from 10 to 25 per cent. of the crop and the greater part of this loss occurs before the foals are two weeks old. Much of

(Continued on page 365)



Fertilize the Whole Field

ONE great feature of the **McCormick** spreader is that it fertilizes every particle of soil, spreading an even coat of manure, light or heavy as desired, up hill or down.

This evenness of spreading is due to **McCormick** design. The reversing apron is driven by a worm feed which maintains the same relative speed of apron to beater at all times. The manure is thus fed steadily to the beater, which tears it into small pieces and delivers it to a spiral beater. The spiral gives the manure a second beating, makes the pieces still smaller and spreads evenly beyond the wheel tracks. Each particle of the soil is thus properly fertilized, and the whole field put in condition to produce a bumper crop. No manure is wasted. A **McCormick** spreader makes twenty loads do the work of forty spread with a fork.

McCormick spreaders are made in three sizes. No. 8 is a 49-bushel machine; No. 5, 55 bushels; and No. 6, 63 bushels. All are of the popular low type, with narrow boxes, cut-under front wheels, and strong steel frames.

See the **McCormick** local dealer, or write the nearest branch house for catalogue and full information.

THE CALL OF THE HEN

For the past few months our publicity department has been shouting for more poultry and more eggs to take the place of meat, which is needed at the front. Our experimental farms have published ration lists for egg production and even adviised us to leg-band our hens and try to cull out all non-laying hens from our flocks.

However, here is where they stop. Is it possible that these men of research don't realiize that there is a scientific side to the humble hen as well as our live stock and seed grain?

When our herds fail to come up to the proper standard they advise us to breed them up with registered sires. When our grain fails to make a good grade they say: "Get pure registered seed." But whe nthe hens fail to come through with a profitable margin of eggs they fail to tell us how to remedy the matter.

As a breeder of pure bred poultry I get a great deal of pleasure from my flock in spite of the very strenuous times we are undergoing on the farms.

This question of the efficiency of the hen has been on my mind a great deal of late and now I'm going to give you some of my ideas on the subject. If anyone else can start something I'd be glad to hear theiir ideas too, for I consider that the subject has been dead long enough.

A few weeks ago I purchased a little book entitled "The Call of the Henn' by Walter Hoagana, and in a few hours' time I possessed the scientific facts of how to determine and breed high egggg capacity hens that had taken nearly a lifetime of study to figure aut. I wouldn't take $10.00 for the little book today and it should be in the hands of every poultry raiser. It's copyrighted and, therefore I cannot explain how to tell your best egg record hens but anyone can secure a copy from the Rhode Island Red Journal, Waverly, Iowa, for the sum of $2 postpaid.

With this book as a guide I believe that 90 per cent. of our flocks could be doubled for egg production in two years. As to the breed one chooses, I believe that the dual purpose fowls are the best for the farm. It has been proven that they will lay practically as many eggs as the straight egg breeds and when matured we have something worth while to eat.

It's not so much the breed as the "strain." Get an egg strain in the breed you prefer and then breed it up from your best egg capacity hens. You say what are my egg capacity hens? All I can say is get "The Call of the Hen" and you won't be long in doubt.

Here iis my plan for the big egg drive:

1. Buy settings of eggs from the trap-nested or high capacity hens.
2. Invest in a scientfic poultry book.
3. Use only big egg capacity male birds.
4. Feed and house your birds properly.

In most cases it is not practical for a farmer to trap-nest, so I say, let's get our eggs from the specialist who can keep egg records. Don't begrudge him a good price for his eggs if his stock is good. I'm paying $5 and $10 per setting for eggs this year and I think they are cheap at that if they produce hens for me that wi l lay from 200 to 250 eggs their first laying year. That's the kind of stuff we need for our foundation stock if we expect to make good in the big drive.

Study your farm papers and your poultry journals for breeders advertising this class of birds and don't be afraid to spend a few dollars for you will get it back many times if the stock is good. And just a word to the breeders right here, too.

Don't hide your light under a bushel—if you have something good, advertiise it! There's a big demand for good stuff and you owe it to your country to boost all you can—so advertise and then advertise some more.

I'd just like to say a few words here about exhibition birds as egg producers. Many people will declare that birds of exhibition classes won't produce the eggs and in many cases I believe it is time. However, as a breeder of Rhode Island Reds in particular I can say that many of the blue ribbon winners in the U. S. last year produced well over the 200 egg mark and I myself have ordered several settings of eggs from prii.e winning females that have laid from 200 to 250 eggs in 10 months of actual trap-nesting. So don't let them tell you it can't be done for it has been done.

Once you have good foundation stock it's a very easy matter to test out any low egg capacity hens if you are equipped with Walter Hoagan's charts—and only the best hens should be used to breed from the following year.

Now comes the male bird. The male bird is half the flock at breeding season and too many people thing that any old thing that can crow is all that's necessary.

If you have a 200-egg hen and use a 100-egg rooster your pullets will likely drop back to the 150-egg capacity or lower—so be careful about the male bird you use. Study your chart for capacity, type, and propotency and don't fall down in yiur mating. Too many people discard their male birds too soon. If you have a plendid cockerel don't pass him up as a cock bird for with proper care a male bird is good for three years.

If you are in doubt as to matings don't hesitate to ask advice from the breeder youm ay be dealing with. He will be glad to help you out and it often saves a lot of valuable time and results.

As to housing and feed I'm not going to say much as that is a subject very well taken care of. My houses are two and a half feet under the surafce of the ground. Concrete 3-foot wall with boards above, plenty of glass and cotton front and I keep the houses well supplied with litter. Our houses mast be warm—for a frosted hen won't lay.

I use wheat screenings in the litter. Oat and barley chop in the hopper. Also oyster shell and two or three times a week I supply vegetables and meat scrap.

This is the egg campaign I've adopted for 1918. If it looks good to you join the ranks, or if you have a better one, let's have it.—R. L. Rash.

NEPONSET ROOFS

NEPONSET PAROID ROOFING NEPONSET TWIN SHINGLES

THRIFT and production are the farmer's watchwords this year. *Paroid* is a tremendous help to the thrifty farmer, because the price is right, it is easy to lay, will require no repairs, and will last for many, many years. To date, Paroid has a record of over 19 years' service.

NEPONSET **Paroid ROOFING**

If you are roofing, or repairing roofs this year give your building the protection of Paroid. For instance, burning cinders falling on a Paroid roof die out harmlessly.

Paroid makes an attractive roof, too, either in the gray finish, or with the red or green crushed slate surface.

Insist on the genuine Paroid. Look for the label as shown here.

MATING THE BREEDING PEN

The shortage of labor and the tremedous increase in feed prices make it imperative that only the very best producers should be kept. Stock that would return a substantial profit in pre-war times, when feed was cheap, will now, under the changed conditions, show a loss. This, perhaps, applies more strongly to poultry than to any other class of live stock, as the securing of suitable feed is becoming more and more difficult.

In the mating up of the breeding pens these conditions hould be borne in mind. Aim to use nothing but your very best birds as it is only from these that the highest results can be obtained.

Selecting the Breeders

The male to head the flock should be from a high producer and if possible to know that his sisters are showing their ability to lay, all the better. Not only should his pedigree be right but he should show vigor in every move. A bird of this description will show a fairly broad head with a rather short, stout beak, a bold piercing eye, a skin that is soft and velvety to the touch, shanks with fine scales and showing a certain amount of red pigment down the outer sides.

His mates should be vigorous females that have shown by egg production what they can do. If trap nests are not used—and they are not o nmost farms—band those pullets that start to lay first and select the breeding pens from them.

The ideal mating is a well developed cockerel of the foregoing description mated to young hens but if enough hens of the desirable type are not available do not hesitate to use pullets, so long as they are well matured and vigorous they will give the best of results.

UNITED STATES FOOD ADMINISTRATION RE STORAGE POULTRY

"All poultry stored before February 1, 1917, must be moved out of cold storage warehouses on or before March 1, 1918, as heretofore directed, but the Food Administration will initiate no action against holders of such poultry if sold before March 1st, to direct distributors to the consuming trade and held in the name of such distributers for n ot exceeding 30 days after March 1st for purposes of actual consumption. In cases where dealers have not moved this poultry as directed because of inability to secure transportation facilities and have evidence of these facts, application should be made to the Enforcement Division, Food Department, for limited extension beyond March 1st."

EGG SHELLS ARE ABNORMALLY TOUGH

What causes the lining of an egg shell to be tough?

It is generally believed that errors in diet are responsible for any marked departure from normal in this respect. At any rate, a dose or two of salts to clear out the digestive system, followed by a careful adjustment of the diet to the requirements of the laying hen will usually correct it. Feed as wide an assortment of grains as possible without using wheat. Make a dry mash of equal parts wheat bran, shorts, ground oats, corn meal and beef scrap. Feed this in a self-feeding hopper for best results.. Rather better results are obtained from feeding cracked corn than whole corn. When cracked corn is procured from a local mill or the corn is cracked in a feed grinder, avoid waste by sifting the finer particles out and using them in the dry mash or mixing with milk to make a johnny-cake. When skimmed milk or buttermilk is available it is an always good addition to the poultry ration. Oyster shell should be always available for laying hens, or some form of lime for forming egg shells. With plenty of water to drink, this makes a good, all-round ration, which may be varied according to the grains that are available.

ABOUT POULTRY

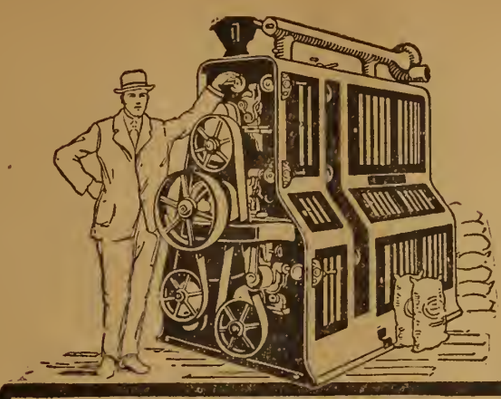
When dressing old chickens for the table, dip them quickly into boiling water, in a pail deep enough to immerse the whole bird at one dip. Hold under only a second, then lift out and roll in a uiece of old blanket, to team and lossen the feathers. This is a good way to loosen feathers for plucking any fowl. The blanket should be thick, so that no heat escapes. They should be left in this about half an hour, then unroll and pull off the feathers quickly. Every feather, except the coarse wing and tail feathers should be saved. If they are not clean, squeeze them out of a warm soapy water and rinse, then place in a large cheesecloth bag and turn and shake occasiionally in the sun, till they are fluffy again. If not wanted for pillows, save in a large sack to be sent with a poultry shipment. They have a high market value.

If a fowl is killed before theday it is to be used, the intestines and crop sheuld be removed as soon as it is cold. When a fowl has been purchased from the market with the intestinies in, it should be drawn at once and the cavity washed thoroughly with water to which has been added a teaspoonful of soda.

When a very old fowl is to be baked parboil, if possible, for two hours, and add a teaspoon of strong vinegar to the boiling water. Remove surplus fat before parboiling, and put it in the baking pan.

Goose or chicken oil is splendid for shortening, but should, if possible, be used within a short time, as it is more apt to spoil than other grease. To clarify a large amount, so it will not spoil ,heat in a deep kettle and fry a batch of potato chips in it. Always keep in a cool place.—L. W. M.

There is on doubt but what caponizing is profitable. The operation costs nothing, and the capons gain in flesh much more rapidly from the same amount of food than other fowls, and when they are sold they often bring nearly double the market price for hens.



Grasp this Opportunity

Establish yourself in the milling business. Your country needs more flour. Thousands of new acres of wheat assure increased production. The local mill is coming back into its own.

Become the miller in your town. Operate a

Marvel

The Self Contained, Quick Process

Flour Mill

This simply constructed mill is your means of helping your country to take care of the increased wheat supply, of making better war flour at the lowest cost—and returning big profits to you. ***A Marvel Mill makes a better barrel of flour cheaper.*** It mills any grade or any grain and conforms to all government regulations.

Made in two sizes — 25 and 50 barrel capacities. No experience — no expensive buildings needed.

If you have as little as $3000 to invest you should get all the facts of this proposition at once.

Royal Purple Poultry Specific

Is the big link between few eggs and a full basket.

It Increases the Egg Yield

Feed Royal Purple Poultry Specific to your fowls daily in a hot or cold mash. It will keep your hens active and healthy by assisting them digest and assimilate the food eaten.

If you feed our Poultry Specific according to directions to fowls which are properly housed you will get nearly as many eggs during the winter months as you ordinarily get in the summer. It will pay for itself many times over. Read the following letter from Robt. Cameron, Hensall, Ont.

"I have been using your Royal Purple Poultry Specific for the past year and it pays for itself many times over in the extra production of eggs, and it makes my hens lay in the winter when the price of eggs is high."

Sold in large and small packages.

FOR HOME AND COUNTRY

This Department will be utilized to the best interests of the homes in the Maritime Provinces. Subjects relating to household science and all that stands for better homes and communities will be published on this page. The editors, Misses Saunders and Winter, of Fredericton, N. B., solicite your assistance in making this page a success and will be glad to publish tested recipes, household discoveries and other articles useful to the homemaker and women's organizations.

THE FIRST BOTTLE

(By Mary Heaton Vorse)

There is a drama which is enacted in every home in this country where there is a baby. It is called "The First Bottle." In some households it occurs very early in the life of the Little Person, right at the very start, and then everything goes well—or it doesn't.

Before this moment arrived in the life of Constance, Louise was seven months old.

I think from the first moment Constance knew what the matter was and that the first little vague fretting of Louise announced to her that her day was over. And though she knew in her heart of hearts that the fateful hour had struck, she put by the moment of facing it as long as she could. The world in those days was full of thorns.

When John would say complacently, "What a hungry little pig she is, she eats harder and more all the time," constance would wince.

A mother may blind herself about such matters. She may tell herself that her Louise is getting ready to cut a tooth—that is why she tries to put a whole fist in her mouth. Teeth, too, may account for the fretfulness. Teething in the world of a little baby covers a multitude of sins. There is nothing, as Constance found out, from colic to temper that will not make older women say, "It's her teeth!"

But that was not what the scales said. Like all properly-reared children, Louise was weighed every week —well, nearly every week, if you must have the truth.

There came a time when the regular gain of ounces lessened with sickening regularity. But still Constance wouldn't believe it. She did not say it out loud even to herself. She looked at its face for the first time when a neighbor, who poked in a kindly gray head every little while to see how things were going and because her grandmotherly heart felt the need of a little baby-worship, said, "She's been kind of fretty of late, hasn't she? I don't believe but what she isn't getting enough to eat? She said it quite cheerfully, too, as if it were not a terrible thing.

"I thought it might be her teeth," objected Constance.

"Oh, that isn't her teeth," announced this mother of grown sons. "That baby's hungry! Tell your mama, darling, I'se hungry; yes I is."

How can people say such things out loud and with a smile. Her baby hungry, and she, poor mother, powerless to help it! The next time Louise was weighed she hadn't gained.

Constance went to the doctor. He told her what she knew all along; Louise was hungry.

Of course, she knew that ths day must come. Indeed, she did not dread it so very much. After a certain time the bottle must take the place of a baby's mother. It is the natural order of things, just as in the time bread and butter and beef juice again supersede the bottle. But now that the peril of it, that had always been lurking in the background, suddenly seemed the largest thing in life.

As Constance passed the drugstore, the harmless, meek-looking glass nursing bottles displayed in the window seemed engines of destruction. She hated them. She hated the cows which passed by the door of an evening, for they, too, might bring death and sickness. Constance passed the evening reading about the artificial feeding of infants, and the more she learned, the more frightened she was. She had always known that babies sicken and sometimes dit at this time, but she hadn't realized the magnitude of the danger.

A feeling of inadequacy to her task rushed over Cnostance. She hadn't felt so helpless and so alone since that awful moment when the trained nurse left the fate of Louise in her untutored hands. John had helped her then with his very presence. Now he was nothing to lean on. He had no experience in the weaning of babies. While he was sympathetic in the matter of germs, he also remarked:

"Al babies have to be weaned some time, don't they? They generally get through all right." That was it, generally they do. But he had one suggestion of value.

"Why don't you ask your mother about it?"

Now there is a great gulf fixed between the rearing of babies in this generation and the last. There is hardly a conscientious young mother living who does not wonder how she and her brothers and sisters lived to grow up, reared as they were in the dark ages. More than once Constance had found her mother unsympathetic about what she termed "new fangled notions." Then, too, older women forget so much. To vital questions like "How old was I when I cut my first tooth?" one was apt to receive answers like "Mercy, Constance, how do you expect me to remember after alt this time!" However, it seemed to Constance that this must be different. Surely her mother would remember more about this. For Constance felt sure that if she lived to be three hundred years old she would never forget the awful sinking of the heart when the doctor so calmly confirmed her fears. But all Constance's mother had to offer was:

"You're going to wean the baby, are you I thought you'd have to soon. It will be much better for you too."

"Much better for her!" Her mother could think of that with a menacing, germ-laden cow mooing triumphantly as it passes the house!

"Did you have much trouble when you weaned us?"

"Trouble? Why, I don't remember any special trouble. Some babies take to a bottle easier than others, I suppose. My children were like others about that. Yes, I think I did have some trouble with John—was it John —no, I think it was Henry; yes, your brother Henry I think it was. He simply wouldn't take the bottle. We had to feed him with a cup and spoon. But he did very nicely in the end. I remember how cunning he looked with his dear little cup and spoon."

That is the kind of thing grandmothers remember, how cunning they looked with the little cup and spoon! But it isn't what poor young mothers want to know.

It all sounds rather humorous from the outside. What a tempest in a teapot, to be sure, and what tragic airs over such a common thing as the weaning of a baby! But it was not funny to Constance, for she knew that this very simple every-day little affair was in reality a matter of life and death, and in cases where it is not a matter of life and death it is a matter of sickness and health; and there she was, so ignorant and so young in the face of such big forces, which she understood so little. It was for her to do, and she had to do it alone. No one could help her. And even though her anxiety communicated itself to the rest of the household, it didn't touch them deeply, not even John. He did not understand. The responsibility wasn't on his shoulders.

So there was Constance preparing to make the awful jump in the dark. The Drama of the First Bottle was an actuality; the cast was already for actiion.

The house seemed full of imminent danger. It was packed closest in the nursery, and from there it trailed out over all the rest of the house and its dwellers like a fog. It even penerated into the kitchen, where the bottles were being boiled. How long does it take to make them sterile? Constance wen and looked it up in the book. Every receptacle that was to hold milk, every spoon tha twas to ladle out sugar or lime water, she boiled. For the moment, the world seemed populated wholly by inimical germs. And as to the harmless-looking milk in the sealed bottles, why that has become a very witch's brew. It was supposed to come from a clean barn, but how can one be sure? The man that milked that cow might be coming down with scarlet fever, and, besides that, cow's milk might not agree with Louise, anyway.

Constance's horizon shrank to a pinpoint. Neither wars nor picnics could have interested her. She was arranging the baby's first bottle of what is so well termed "artificial food." What she wanted to know was, were those bottles sterilized or not? She did not care what merry-makings took place without her. Let all the world go if they wished; it didn't interest Constance. She was occupied with, weighty matters.

What formula should one begin on? It sounded so very simple in theory; it was so difficult in practice.

The theory goes this way: Of top milk take a certain percentage and to this add a certain prescribed amount of water and sugar. Preserve scrupulous cleanliness of all the articles employed; bring the sacred bottles rapidly to a high temperature and cool rapidly. That is all. It is simple than making cake.

That is all; but there is no other simple task in the world that is so hard to get right. While she worked, Constance could hear Louise talking to herself. She was so well and happy now and here was her own mother going deliberately to give her something that might make her sick and unhappy. It had to Constance all the terrors of a major operation.

Nor did she receive any sympathy for her meticulous and anxious care. This measuring of ounces is a new thing, you see, and is therefore looked upon with suspicion by the older generation and by a good part of the younger.

On the piazza the gray-haired neighbor and Contance's mother were talking. Her mother's voice floated to her:

"Gracious! Life's hardly worth living nowadays, the fuss that's made over every little thing, what with boiled water and sterilized milk! I gave the baby a drink from the faucet the other day and one would have thought I was trying to murder the child, the way Constance acted. She gives it boiled water if you please, boiled water and sterilized milk! Boiled and kept in a bottle by itself!"

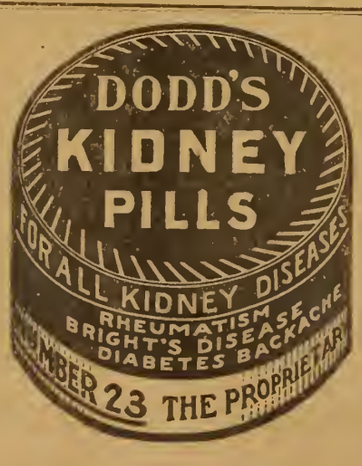
"In my day," said the neighbor, when we got the baby's bottle ready, we put some good rich milk and some water together and sweetened it till it tasted good."

It was a beautifully simple way. If the baby had a colic afterward, one could tell that it had not agreed with it; if it did not have a colic one might assume that it had. The older generati oncan hardly forgive the mothers of this for their new ways, while the mothers of this generation listen to this artless prattle with a shudder. Such t alk seems to the poor, anxious creatures only a degree removed from the placid discussion of child murder.

"Yes," went on Louise's grnadmother. "Constance is acting just like a hen with its head cut off. One would think, to look at her, she was getting ready to poison the baby."

"The work young mothers make of babies nowadays! It's a wonder there's a child lives to grow up, with the sterilizing this and the sterilizing that. Thank God, my babies were all raised before germs were invented. Whenever I see an article on germs, I skip it," the neighbor added proudly. "I don't want to know anything about nervous."

"They'd make you more nervous if you had a young baby in he house," said the grandmother with spirit. "Look at Constance, now. Of course, weaning a baby is a little trying, to be sure; but if she could get a kettle large enough, Constance would boil



RELIEF AT LAST

I want to help you if you are suffering from bleeding, itching, blind or protruding Piles. I can tell you how, in your own home and without anyone's assistance, you can apply the best of all treatments.

Dizzy and Faint Spells

Are Warnings of Heart Trouble That Should Be Heeded.

Those feelings of weakness, those dizzy spells and "all gone" sinking sensations, which come over some people from time to time are warnings that must not go unheeded. They indicate an extremely weakened condition of the heart and a disordered state of the nerves.

Those who are wise will start taking Milburn's Heart and Nerve Pills before their case becomes hopeless. They have no equal for strengthening the heart and invigorating the nerves.

Mrs. Emil Brooks, Upper Gagetown, N.B., writes:—"All last summer and winter I had dizzy and weak spells, headaches and fainting and blind spells. A friend recommended Milburn's Heart and Nerve Pills to me. I had only taken two boxes when I found great relief. I highly recommend them to all who suffer from heart trouble."

Milburn's Heart and Nerve Pills are 50c. per box at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

this whole house and everybody in it, to be sure everything was sterile. But there's one thing she can't sterilize; htat's the baby's thumb! And I'm perfectly sure if she keeps on she'll upset that child pottering and fussing as she does."

At last the mixture was prepared with all accuracy. Constance had followed every direction and said to herself that she was going to give Louise her first bottle.

Oh, but was she There are two to that bargain, as Constance speedily found out.

Some other member of the family must, of course, administer the dose. The choice fell on the baby's grandmother, while Constance, after the custom of young mothers in such circumstances, huddled at the other side of the closed door and listened in anguish of spirit to what went on inside.

Take one lusty baby and support it firmly with one hand. Now take the nursing bottle in your right hand and insert it in the baby's mouth. That's easy enough to do isn't it? See what happened with Louise.

She chewed on the rubber a little and remarked "Ag-goo." But that is not what was wanted of her. A rubber nipple isn't a plaything to be chewed on and goo-ed over.

Hhe grandmother now shook the bottle slightly, to give Louise some idea of what was expected of her. Warm drops of milk slid down her little face. She made no effort to swallow them. Besides, she no longer desired the rubber thing n iher mouth, and spit it out. The grandmother watched her chance. Little persons like Louise are always opening their mouths, and the rubber nipple was popped in again when Louise was off her guard. This time a few drops ran down her throat.

"Ah, that is what it is in here for, is it? Something to eat!" Like the fair-minded child that she was she was willing to give it a trial. She took a tentative swallow. A queer proceeding it was anwway; one could see she thought. But she was willing to do her share and her share consisted in tasting gingerly of that moisture into which had gone so much heartbreaking care.

"Oh, .please take it, Louise!" Constance boaned in spirit. "You do not know how hard your mother's worked! You do not know how much it means to me! Here I am behind the door, listening to you. Please, please realize that this is your serious business in life. Please be good if you love me!"

But there was never a truer saying than that you can lead a baby to the bottle, but can't make her drink. Louise made it plain that she did not want anything to do with it, that is a sure thing. She was equally sure that she would not, and as for the tenth time the bottle was patiently presented before her gaze and in an unaware moment even slipped into her mouth, she broke forth into roars. She roared all over her; she roared with her hands and with her feet. She fought it. There was no coquetting with food, no fine-lady airs of a replete baby. On the contrary, she was hungry. The few drops that went down her throat were enough to remind her of that. She was hungry and wanted her nice soft mother, nor did she care who knew it. She wanted everyone in the house to know it, and everybody in the street and in the world, and she was determined that they should.

There is a phrase known to those who write of infancy, "the baby kicked and screamed." We are so used to it that we write it and read it lightly. Ah, but have you ever watched that terrifying spectacle with your own baby? She "kicked and screamed!" Indeed she did! It is a noise more terrifying than thunder. It is awful at any time. When she kicks and screams because she doesn't want to be "artificially fed," when she kicks and screams because it is her own mother she wants, the horror is intensfied.

Every one had sympathy enough then. No one could hear that tumult unmoved. John, you may be sure, walked the floor in an agony of helplessness. Louise's grandmother dropped her rocking chair attitude of mind, and as for poor Constance, she couldn't bear tht acry.

And there is another of those words that we have used so often that their meaning has worn off and left them smooth and insignificant. Now Constance learned the primitive meaning of those words, "I can't bear it."

Darkness brooded over the household long after Louise, replete, tranquil, had forgotten about it; for Constance had to come to the rescue, but all the family, except Louise, knew that the same scene must be gone over tomorrow and the day after. There was nothing for it but starvation. Louise would have to give in.

Next day the bottle was presented to her tentatively, humbly. All the household was unquiet; they walked up and down and asked each other: "Are they giving it to her now?"

One would think ti was ether, at least, that was being administered instead of a bottle of harmless milk.

With all precautoin and tact, the bottle was put before her. One would expect of course, a cry of indignation. But Louise had forgotten all about it. She did not remember that this is what made her doubt that there was justice in the world yesterday and which made her voice her angry distrust.

Wihtout any warning she took it as if this was the food to which she was accustomed. She ate placidly, her eyes roving around the ceiling. She filled herself full and talked for a

He Knows Just Why He Admires Them

DODD'S KIDNEY PILLS CURED MRS. MERCREDI

She Had Been Ill Two Years and Could Find No Cure.. That's Why Her Husband Is Enthusiastic Over Dodd's Kidney Pills.

Fort Smith, Alberta, March 15th.—(Special)—Among all the thousands of Canadians who praise Dodd's Kidney Pills for the good hey have done, there is no more fervent admirer of the great kidney remedy than Isidore Mercredi, of this place.

"Yes, it always gives me pleasure to say a good word for Dodd's Kidney Pills." Mr. Mercredi says. "My wife was sick for two years. We could not find anything to restore her to health. Then we found a pamphlet telling of several persons who had been cured by Dodd's Kidney Pils.

"My wife used just two boxes of them and she is perfectly well, to the great surprise of all our neighbors. They can tell you the same thing. I cannot recommend Dodd's Kidney Pills enough."

Dodd's Kidney Pills are the greatest of all remedies for weak, suffering women. They cure the kidneys. The kidneys are the root of nine-tenths of women's ills. Moreover, cured kidneys mean pure clear blood all over the body. That means good health everywhere.

while afterward, contentedly, that charming talk which is the little baby's poem in praise of food. It means:

"I have eaten. How bright the sun shines! I am full of food. How good is the world! I have eaten so I do not want to eat any more. How pleasant are the faces about me!"

And meditating on how pleasant is life with the stomach full, Louise fell asleep. The Drama of the First Bottle is over.

A SUBLIME FUNERAL ORATION

Here is a funeral oration that would seem to challenge comparison with some of the finest we possess by its pregnancy and its poignancy, its brevity and its sublimity. But even in spite of the hurried times we live in, it must be read at least twice for some of its many beauties to be realized," writes Mr. Coludesley Brearton in The Fornightly Review, in an appreciation of a new thinker, Binchara Branford, the author of "Janus and Vesta."

"To pay honor to the memory of the dead we living meet here today.

" 'From the bounteous womb of our great motherhood these dead heroes received the gift of life. That gift, in her defence from foreign foes, they rendered back.

" 'For us they faced the terrors of death; but such things veil from us their inner meaning.

" 'All great things and good hath God seen fit in His infinite wisdom to offer to our mortal eyes in forms that repel and chill our feeble hearts; whereas the garb of evil draws us as with enchantment. Our infiniteness comprehends not the peerless gift God offers, but in moments of exaltation of soul and ecstasy of body, the immortal spirit of man pierces through the dread form and sees with the inner eye the majestic figure of the All-beautiful. Bchind the veil of death appears a smile of ineffable sweetness so compelling that the spirit would fain abide there for ever.

" 'At that supreme moment when Death meets Life, Man rises to the pinnacle of heroism, and achieves his immortality.

" 'So came death to those brave ones whom we here in all reverence commemorate. In his embrace they consecrated Life.

" 'Their grave is the bosom of universal Mother-Earth and their vault is the starry firmament of Heaven. In the spirit of each lives the spirit of Earth. Dust we are, and to dust we all return. But every smallest particle of that priceless dust enfolds within itself a very galaxy of stars, and this God-created body thrills everlastingly in ways that we comprehend not, but yet can apprehend, with the magic of matter, the miracle of life, and that mystery of mysteries, the individuality of man.

" 'The Resurrection is not a tale that is told; not a fable whose truth is fled; but a great vision of the Spirit that dwells imperishrable and divine in the secret heart of each.

" 'Those whom the gods love die young. Let us weep no longer then, for those that are fallen, but enshrine in our hearts the deeds they did for us, and let their spirits breathe sweetly into ours the sublime truth that Death is no evil.

FIRST AID IN THE KITCHEN
Mends Leaks in Graniteware, Tin, Aluminum, etc., in two minutes without tools. Saves a kettle for half a cent. At dealers or from us, 15 cents.
Vol-Peek Co., Box 2024, Montreal, Can.
VOL-PEEK

" 'Then, not in vain, shall the Motherland in her need call unto us that remain to face our duty on the battle field of life, ever faithful soldiers of God. For the ancient saying stands fast; that the chief end of man is to magnify the glory of God and through suffering to enjoy Him for ever."

RUSSIA'S MIXED POPULATION

Russia, with an area of 8,600.000 square miles, exceeds all other countries in extent. With a population of 180.000,000, it exceeds all other nations in numbers. With over one hundred languages, it exceeds all others in diversity. For centuries Russia had been held together by a despotic Czar, backed by a vast army amidst an unarmed people. When the old Government fell from mere rottenness, and the army collapsed, distntegration of the whole fabric was the natural consequence.

There are wide discrepancies in language, physical type, custome, dress, and rcligion in Russia. The two main races in Russia proper are the Indo-Europeans in the southwest and the Finns in the northeast, the Finns being an offshoot from the Mongolian race. Russians or Slavs of Aryan or Indi-Europann descent amount to about 75 per cent. of the population of European Russia. They are members of the Greek Catholic of which several sects exist and they are divided into three stocks. The Great Russians, unmberinig about 52.-000,000 in European Russia, live in territory from which they have driven the Finns, with which people they are somewhat mingled, and thus occupy northern and central Russia, including the northeastern part of the "Black Earth" region, and also territory in eastern and southeastern Russia from which they have driven the Tatars. Physical ythey are blond, blue-eyed, and vigorous, with broad shoulders.

OLD TIME LOVE LETTERS

In an old book, dated 1820, there is says the People's Companion, the following very curious love epistle. It affords an admirable play upon words:

"Madame—Most worthy of admiration. After long consideration and much meditatioin on the grcat reputation you possess in the nation, I have a strong inclination to become your relation. On your approbation of the declaration, I shall make preparation to remove my situation to a more convenient station, to prcfess my admiration, and if such oblation is worthy of observation and can obtain commiseration, it will be an aggrandization beyond all calculation of the joy and exultation of yours.

Sign,

Sans Dissimulation.

The following is the still more curious answer:

"Sir—I perused your ovation with much deliberation at the great infatuation of your imagination to such veneration on so slight a foundation. But after examination and much serious contemplation I supposed your animation was the fruit of recreation or had sprung from ostentation to display your education by an odd enumeration or rather multiplication, of words of the same termination, though of great variation, in each respective signification. Now, without disputation, your laborious appliciation in so tedious an occupation deserves commendation, and thinking imitation a sufficient gratification, I am, without hesitation yours,

Mary Moderation.

PAT'S INVESTMENT

Pat bought a pig in the fall, paying $7.50 for it. During the winter he bought $10.50 worth of feed for it and in the spring sold the pig for $17.50.

A neighbor asked him how much he got for it, and when Pat told him he said: "Well, you didn't make much on it, did you?"

"No," said Pat, "but you see, I had the use of the pig all winter."

COMMON CLEANING AGENTS

Such common materials ac ashes and brick dust should not be overlooked for souring purpuses. They are used much the same as commercial prcparations and serve the purpose quite as well. The best way to use scouring agents is to dip a large cork in water, then in the ashes or brick dust and scour the utensil with the cork. Much better rcsults are obtained than in using a cloth. Even soil can be used in this manner, and nothing shines up a knife so quickly as to dig a few dandelions with it.

These are old-rashioned metads, but are weli to remember for we are looking for the most inexpensive ways and means.

FREEDOM AND MARRIAGE

A gentleman travelling through Alabama was much intcrested in Uncle Ned. "So you were once a slave, eh?" said the gentlcman.

"Yas sah," said Uncle Ned.

"How thrilling!" said the gentleman. "And after the war you got your freedom, eh?"

"No, sas," said Ned gloomiyl. "I didn't git mah freedonm, sah. After de war I done got married."

When Driving

While driving I found the wind very chilling as it blew into the sleeves of my coata. I had two pairs of long gloves made of heavy brown kid, too worn for further service. I cut off the hands, cut opcn the wrists and stitched the two wrists together lengthwise making two large wrists, as it were. I made a half inch hem at the wrist and anaother at the elbow to accomodatc elastic. When driving I wera these over my other gloves and inside my coat with great addition to my comfort.

Dishes should be separated and sorted as brought from dining room.

COOKING HINTS

Cereal Biscuit Pudding

Soak one tablespoon of gelatine in one-third cup of cold water. Add two-thirdc cup of boiling water to dissolve Into two cups of milk, add one-half cup of biscuit crumbs, one-half cup of sugar, and one-eighth teaspoon of salt. Cook in a double boiler ten minutes. Then add two egg yolks well beaten. Cook two minutes. Remove from fire, and add the gelatine mixeure. When cool add one-half cup of whipped cream. Scrve very cold with cream.

Jellied Prnues

Wash one-third pound of prunes and cook until soft. Remove prunes from juice. In one-half cup of water soften two tablespoons of gelatine. Dissolve in the boiling prune juice. Add one cup of sugar, the juice of one-half a lefon, and the prunes, whicr should be stoned. Allof to stiffen. Serve with milk.

Mock Sausage

Soak one-half cup of raw Lima beans ovcrnight. Boil in same water until soft. Drain and force through a colander. Combine one-third cup of breadcrumbs, three tablespoons of artifical lard, and one egg with the bean pulp. Season with one-eighth teaspoon of pepper, one-rourth teaspoon of salt, and one-half teaspoon of sage. Form into sausage and fry in deep fat. Serve with sauted apples.

Cream Puffs

Heat one cup of water and one-half cup of vegeetable oil to the boiling point. Sift into the liquid one and one-half cups of white flour and one-half teaspoon of salt. Cook five minutes, stirring through the whole process. Cool. Add two unbeatcn eggs and mix thoroughly. Drop an oiled minutes. To fill remove a portion of the top.

J. A. SIMMERS
LIMITED
Bulbs, SEEDS, Plants
TORONTO - ONT.

Filling for Cream Puffs

Mix one-fourth cup of corn starch with two cups of milk. Beat until smooth. Cook in the top of a double boiler until thick. Beat two eggs, seven-eights cup of sugar, and one-eighth teaspoon of salt. Pour the hot milk into the egg mixeure, stirring constantly. Return to the double boiler and coog until eggs thicken. Add one an one-half teaspoons of cooking oil. Cool and add one teaspoon of vanilla.

Split Pea Soup

Soak one cup of split peas overnight. Drain and add to two quarts of water, add a chopped onion and cook until the water is reduced to one quart. Put through a colander. Mix two cups of milk with three tablespoons of flour. When smooth add one teaspoon of salt, two tablespoons of cooking oil, and one-fourth teaspoon of butter. Add to the soup stock and cook until thick. This soup may be varied by substituting one cup of dried beans or lentils for the spilt peas.

Creamed Eggs in Potato Nests

Cook the eggs until hard. Shell and separate the yolks from the whites. Chop the whites and add to a medium white sauce. In an oiled baking-dish make nests of mashed potatoes. Put the white sauce with the egg whites into the nests. Grate the egg yolks over the top and place dish in the oven to brown.

Rolled Oats Bread

To two cups of rolled oats add two cups of boiling water. Let stand until cool. Add one-half cup of molosses, one-tablespoon salt, and one tablespoon of cooking oil. Then add one-half yeast cake softened in one-half cup of lukewarm water. Add three cups of bread flour. Beat well and let rise. Beat thoroughly and turn into buttered bread tins. Let rise and bake.

Corn-Meal Puffs

Mix and sift one and one-half cups of corn meal, one and one-half cups of flour, one-half teaspoon of salt, one-uqarter cup of baking powder. Beat well the yolks of two eggs and add one-half pint of milg and mix with the flour. Beat vigorously for three minutes, and then fold in the stiffly beaten whites of the eggs. Bake in little gem-pans in a hot oven.

Cheese Pudding

In one-half cup of milk and one egg, soak slices of bread until soft but not broken. Put a layer of bread an then one of the grated cheese into an oiled baking dish. Repeat until one-third cup of cheese is used. Have bread on the top layer. Bake in moderate oven until cheese is melted.

Cheese and Kippered Salmon

Put into a casserole a layer of crumbs, a layer of salmon, and then a layer of grated cheese. Repeat until one-half pound each of salmon, cheese an dcrumbs are used. Finish with cheese. Pour enough sweet milk over all to moisten. Bake in moderate oven one-half hour.

Apple Jam

Pare and cut apples into quarters, core and cut into rather thick slices; to every pound of apples allow one pound of brown sugar, and to every five pounds of apples allow the thinly cut rinds and juice of four lemons and one half pound of ginger root and one ounce of cloves. Let stand in a bowl until the apples are a rich amber color and perfectly clear.

Brown Sugar Cake

Mix and sift three cups of flour, two cups of brown sugar, two teaspoons of cinnamon, one-eighth teaspoon of salt, ne-half teapoon of soda, two teaspoons of baking powder, and one-half teaspoon of nutmeg. Rub in one cup of cooking oil as for pastry. Take out one cup of mixture. To the remaining ingredients add one cup of sour milk and two eggs. Bake in a bread-pan putting the cup of material on the top of the cake just before beking. Do not bake too fast.

Put away all food and clean dishes. Salt and peppers, sugar bowls, etc., should be filled when taken from the table.

Grandmother's Pies *are done*

HOW *luscious* they look as she takes them from the oven. Here is a kind well worth your attention, made from dried apples, small raisins and brown sugar. "*Spring mince pies*" grandmother called them. She had many other delicious pies and pudding made from brown sugar —in fact she hardly used *any other sugar* for cooking.

Lantic
Old Fashioned Brown Sugar

is just like the sugar that Grandmother used to use. It comes in *Light, Brilliant* and *Dark Yellow*, but the *Brilliant Yellow* is about right for most of the things Grandmother made and for your own favorite brown sugar dishes.

You should keep brown sugar in your pantry and you should use it oftener. It has a delicious *characteristic flavor* essential to the success of many dishes. It is economical, too, costing less per pound than granulated.

If you don't know how to make Grandmother's good old-fashioned dishes, no matter. We have just printed a delightful new booklet called "*Grandmother's Recipes.*" It is devoted entirely to brown sugar goodies. Send for it to-day enclosing 2 cent stamp to cover cost of mailing and please add the name of your grocer.

Lantic Old-Fashioned Brown Sugars are made by the same firm that makes the famous Lantic "FINE" Granulated.

SUFFERED WITH HACKING COUGH

COULD NOT SLEEP AT NIGHT.

The constant hacking cough that sticks to you in spite of everything you have done to relieve it, is a source of danger. The longer the cough stays, the more serious menace it is to your health.

It is easy to check a cough at the outset with Dr. Wood's Norway Pine Syrup. If you have let it run though, it takes a while longer to cure, but Dr. Wood's Norway Pine Syrup will cure it even then after other remedies have failed.

Mr. J. Henry Landry, South River, Burgeois, N.S., writes:—"I received such great benefit from Dr. Wood's Norway Pine Syrup that I cannot help expressing my thanks. I suffered with a hacking cough for over a month, and could not sleep at night. I used many kinds of remedies, but they didn't do me any good, until I used 'Dr. Wood's,' and found great relief right from the start. I only used two bottles, and was completely cured. I will never be without it as long as I live."

There are a number of substitutes on the market for Dr. Wood's Norway Pine Syrup, so when you ask for it see that it is put up in a yellow wrapper; three pine trees the trade mark; price 25c. and 50c., and that it bears the name, The T. Milburn Co., Limited, Toronto, Ont.

WHY SOME BOYS DON'T LIKE THE FARM

There are two sides to every question, and when we hear complaints about the boys of the age running away from the farm and flocking to the city, we do not always consider all sides, but only wonder at the whyfor of it all.

From one point of view it does seem almost unaccountable to forsake green pastures and running brooks, birds and wild flowers, peaceful and wholesome surroundings for the noise and confusion and bustle of city life. Before we criticize harshly or unknowingly, let us look below the surface and ascertain the real reasons.

If a genuine comradeship exists between a boy and his father, there is far less likelihood of his desiring to seek other avenues.

What justice is there in criticizing or blaming boys who have no privileges or rights in the home for running away from home or at least longign go?

Let me tell you of one father who takes every dollar that his boys earn up to twenty-one and banks it for himself, never allowing them any luxuries or trips or spending money.

"I'm mighty glad he is not my dad or Don's," remarked a bright, wide-awake, wholesome Toronto boy who was a guest of a neighbor of this penurious and exactnig father.

A sixteen-year-old son who was earning $1.25 a day for a neighbor during the season was only allowed 35 cents out of a check for $25 paid him by his employer.

Not alone that, but he was expected to rise at four-thirty and do the milking and part of the chores before and after his ten hours' work was done for his employer.

And yet his father is a well-to-do farmer.

Other farmers give a child a calf, colt or pig, which said child is expected to care for and permitted to think is his until sold when the father pockets the money.

Unless parents ylay fair and are just, how can they expect their children to be honest and fair and love their homes or farm life?

Under right conditions and with fair treatment farm life can be made most attractive in this day and age. It need no longer be mere drudgery and slavery, as it was looked upon by some of our ancestors.

A farm house today can be as up-to-date as a town place, with fifst class pulmbing, lighting and heating.

The automobile is as much in evidence in the country as in town and the auto tractor simplifies farm work.

HERE'S A HAPPY MAN

(From Chicago News.)

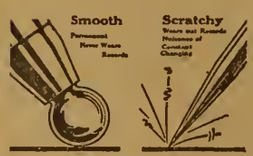
Why does nobody emphasize the joys of winter? Why don't we sit cozily in our homes and read Whittier's "Snowbound" until the tears of appreciation course down our cheeks? When Whittier says, "Boys, a path!" why don't we all shovel and enjoy the fun as the "hoary meteors" fall? The recent heavy snow is the best thing that ever happened. It saves the winter wheat from complete destruction and helps the wheat supply large for next year. Snow acts as a good fertilizer on gardens and farms and will increase the output next summer. Were it not for the big crops all of us would starve to death. Better that a few should freeze to death than that all should starve to death. People in the South live in wretched hovels because nature is bountiful and man moves along the lines of least resistance. Give me the snow, where a respectable germ can't live, where energy must be released continually if one is to keep warm. Give me rich Northern milk, where cream is thick as leather and a rich, healthy yellow. Give me in season Riley's "When the frost is on the pumpkin and the fodder's in the stock." Give me that glorious appetite for the Thanksgiving Christmas and New Year's of fat duck roast goose, chicken, stuffed turkey, roast pig and mince pie. With a warm fire, a cozy home and friends, snow is beatutiful.

THE PORRIDGE DIET

A great many people are deriving unexpected benefits from restricted war diets. Moved to lessen their consumption of food in the interests of the Allies, they are discovering that they have always eaten to much and that they are much better off physically and mentally when they eat a great deal less. This applies especi-

Those Wonderful Pathe Records

OWE their rich, full, natural tone to two things—a unique and secret method of recording, and their reproduction by means of a round, polished sapphire ball.



It should be evident to all that a *ball* of sapphire, jewel-polished under the microscope, and *fitting perfectly* into the half-circle of the sound groove, along which it smoothly, beautifully *glides*, is bound to produce a TONE of purer quality than that produced by a steel needle that becomes a jagged chisel before the record has revolved three times.

Hear these late Pathe Records

Remark their quality—compare them with the same selection of other makes—and bear in mind that every Pathe Record played with the sapphire Ball is guaranteed to play at least ONE THOUSAND TIMES. Can you afford to buy any other RECORD?

Good territory open to live dealers 11

ally to men of sedentary occupations engaged chiefly in mental work. The News knows at least two men who take nothing but a large portion of oatmeal porridge for their breakfast and whos luncheon generally consists of rolls and cofiee or tea.

These particular men eat a more substantial, but by no means heavy, evening meal, and they boast that never before did they enjoy such good health or spirits. It remains to be said that both are engaged in heavy brain work for from 10 to 12 hours a day. We know of a club man, who all his life long has been what may be called "a high liver" on two continents and who is amazed at the improvement in his health which has resulted from a lowered war-time diet. No general rule can be laid down which will embrace all kinds and conditions of people, nor can people engaged in hard manual labor get along without considerable strong food. The fact remains that in saving flour, beef, bacon and other edibles for our Allies in Europe tens of thousands of Canadians will reap dircet advantages in their own persons of which they did not dream.

THOMAS JEFFERSON'S TEN RULES OF LIFE

1. Never put off until tomorrow what you can do today.
2. Never spend your money before you have it.
3. Never trouble others for what you can do yourself.
4. Never buy what you do not need because it is cheap.
5. Remember that pride costs us more than hunger, thirst, ro cold.
6. One never repents of having eaten too little.
7. Nothing is ever troublesome that we do willingly.
8. The most pain comes from those evils that never have happened, except in our imaginations.
9. Take things alawys by their smooth handles.
10. When angry, count ten before you speak, when very angry count a hundred.

CRETONNE CUSHION TOPS

Perhaps you put off laundrying the cretonne covers because you dislike the task of ripping the seams to remove the cushions and then sewing them again. Try making your covers in another way.

Take a strip of crettone as long as the cushion and two and one fourth times as wide. Hem one end. With the wrong side out fold the material the size of the cushion and the other end lopped ever one fourth of the width. Stitch both end. Turn right side out, slip in the cushion and it will be held in place by the pocket formed by the exrta material.

PERILOUS RIDE

Four miners in British Columbia had a most exciting and perilous ride recently when they were carried 1,500 feet at breakneck speed on the tail-end of a snow slide in the Selkirk Mountains and plunged 250 feet into a chasm.

After the plunge they were buried in the snow, but managed to gain the surface after several hours of unceasing toil. They were hemmed in on all sides, and the walls of the crevasse rose sheer over them for hundreds of feet. In this condition they remained for nearly fifty hours When they were ready to give up, a rope from the heights overhead came dangling down from a rescue party.

Everybody Knows Dr. Chase's Receipt Book

"Ever since I can remember, this was the most valued book in the bookcase."—Mrs. S. Thompson, Smith street, Kingston, Ont.

"Mother has had Dr. Chase's Receipt Book for 20 years, and, I tell you, it is a good one."—Mr. John Miller, S. Salt Spring, B. C.

IT may be safely said, without fear of contradiction, that there is no more useful book to be found in any home than Dr. Chase's Receipt Book. The proof of this statement rests in the fact that several millions of copies have been sold, and it is sometimes said that the circulation is second only to that of the Bible.

From the time he began the study of medicine it was a hobby of the doctor to collect all recipes and prescriptions of exceptional value. There is so much of the doctor's own experience and history woven into these recipes that you cannot use his book without feeling that you know him personally and appreciate his sterling character.

The Receipt Book was soon widely circulated, and aroused so much favorable opinion towards the doctor that he found the demand for his medicines far greater than he could supply. This led to the decision to select a few of his most successful prescriptions and place them on the market for general sale.

This action met with some criticism from the medical profession, but Dr. Chase's motto was "the greatest good to the greatest number," and one cannot estimate the suffering alleviated and the lives saved by this generous action on the part of the doctor.

The use of Dr. Chase's medicines has become so general that there are few, indeed, who do not know something of their sterling merits. So enormous have the sales become that imitations have been put on the market and substitutes are offered by unscrupulous persons who seek to steal the reputation of their originator.

Dr Chase's Syrup of Linseed and Turpentine for Coughs, Colds, Hoarseness
Dr A.W. Chases
Worth $5 a box
Dr Chases Nerve Food
Dr A.W. Chase's Kidney and Liver Pills
Catarrh

But the doctor has protected you by having his portrait and signature printed on every box of his medicines. By taking care to see these on the box you buy you can be certain that you are getting the genuine.

The latest edition of Dr. Chase's Large Receipt Book, containing over 1,200 pages, will be sent, postpaid, on receipt of price, $3.75, by Edmanson, Bates & Co., Ltd., Toronto.

Dr. A. W. Chase's medicines are for sale by all dealers, or sent on receipt of price by Edmanson, Bates & Co., Ltd., Toronto.

2

LET a woman ease your suffering. I want you to write, and let me tell you of my simple method of home treatment, send you ten days' free trial, post-paid, and put you in touch with women in Canada who will gladly tell what my method has done for them.

A MESSAGE TO WOMEN!!

If you are troubled with weak, tired feelings, headache, backache, bearing down sensations, bladder weakness, constipation, catarrhal conditions, pain in the sides, regularly or irregularly, bloating, sense of falling or misplacement of internal organs, nervousness, desire to cry, palpitation, hot flashes, dark rings under the eyes, or a loss of interest in life, write to me to-day. Address:

Mrs. M. Summers, Box 309 Windsor, Ont.

HOUSEHOLD SUGGESTIONS

A Scrubbing Box

Use an ordinary soap-box, remove the top and one side, tack in a padding about siix inches deep. An old cushion or piece of comforter is very good. A person can kneel in this and scrub or go over polished floors, and neither feel the effects of kneeling nor expose their skirts to the dust or water.

To Keep Scissors Sharp

Take a small bottle and use your scissors as though you were going to cut off the neck of it. Work the scissors form one end to the other until you have a good edge.

To Teach Children About the Germination of Seeds

,ake a drinking glass, line the inside with blotting paper and pour just enough water in the glass to wet the glass. Between paper and glass put seeds, a dozen different ones may be put in one glass. Soon they sprout a .d grow. The children can see each day just what the progress of the g owth is. The glass will fill with roots and the tops shoot above the glass. Keep paper wet.

Hints on Clearing the Table

Much labor, confusion and time may be saved by the busy housewife if she will use a little thought in clearing the dining table.

Neatness and order in the pantry depend on the way the table has been cleared.

CLEANING SEED

(Continued from page 342)

to the mill before treating—if none is available at the farm. Should, however, any smut balls appear on the surface of the solution when grain is being treated, it is necessary to remove them quickly. The smut balls are much lighter than the grain, and will rise to the surface when the latter is vigorously and repeatedly stirred. We have found, however, that the timie of treatment given to wheat or other grain is far too short to permit the removal of all smut balls rising to the surface. Even when prepared and working quickly, we have not sucoeeded in scooping off all smut balls that came to the top during treatment, under 10-15 minutes. This long exposure of grain will seriously affect the germination."

Various patent devices for making difficult separation, such as wheat from oats, wild oats from barley or wheat, vetch from rye, etc., are on the market, but these cannot be described here; neither can we go into the various combinations and gangs of sieves recommended by different firms for certain classes of work.

In cleaning cereals a large mesh woven wire sieve is usually employed as a topmost sieve to take out straws and the larger imprities which otherwise would clog the riddle and interfere with the separation it is intended to make.

Wheat.—A zinc sieve with perforations about 12, 13 or 14 sixty-fourths of an inch in diameter is generally used as a riddle. Such impurities as oots will often slide the length of such a sieve and fall off behind, while wheat tips on end falls through the perforations A number of these riddles with the same or approximately the same perforation is often arranged one above another. By this means an oat or a wild oat falling through a perforation is started again on the sieve below, and is ultimately run off behind.

Several types and sizes of sieves rae used in the lower shoe for cleaning wheat. The 8-64 or 9-64 perforated zinc, 7 by 7, 8 by 8, and 9 by 9 square mesh woven wire, and the 2 by 9, 2 by 10, and 2 by 11 long mesh woven wire are all in use. In deciding which sieve to use, the kind of wheat, nature of impurities, and object of the cleaning—whether for seed or market—must be considered. The buckwheat screen is sometimes used for the separation of wild buckwheat from wheat.

Barley.—The cleaning of barley requires similar although not identical sieves to those used for wheat.

Oats.—I ncleaning oats the most important sieve is the lower one. The size of the opening, its slope and shake should be such as to get everything smaller than the plump oats to pass through. A useful sieve for this purpose is made of zinc with oblong perforations. The size of the slits to be used will vary with the kind of oats. A variety with a large kernel will of course require a wider slit than one with slim kernels. The 5-64 by ½ may be taken as a standard. For very plump oatts the 1½ by ½ is about right.

Long mesh woven wire screens are commonly used instead of the perforated zinc. Square mesh sieves are used also.

Flax.—Flax requires on top a woven wire sieve such as the 3 by 16, 4 by 16, or 4 by 14, or a 1-16 by ¼ perforated zinc screen below.

To Get Proper Sieves for Cleaning Seed

Every farmer who has a fanning mill that will not clean his seed with the sieves supplied should send a sample of the seed to the manufacturer, asking him to send a sieve to do the work. No mill is equipped with sieves for every kind of cleaning; they are fitted for cleaning the average lot of seed. The farmer who is willing to pay for a sieve to clean his seed should be supplied be supplied with the sieve he needs.

It is to the interest of the manufacurer to have his mill do satisfactory work, and nearly all of them are ready to supply additional sieves for special work. If you cannot get what you require from the manufacturer, communicate with the Seed Branch, Department of Agriculture, Ottawa, and we may be able to help you.

New Sieves for Old Mills

In most districts in the older settled parts of Canada there are a great many fanning mills that were bought fifteen or twenty years ago. Many of these are still in good repair, but most of the sieves that originally came with them are lost or worn out. Of the firms who built these mills many are out of business; others are now building a mill of an altgether new model, and have not on hand a supply of frames to fit the old ones. Farmers who wish to order sieves for such a mill may use the following list as a guide in deciding what sieves to order. The list includes the sieves which will be found to be of most general use for the various purposes indicated, but before deciding finally what sieve to buy for cleaning a specific kind of seed read what is said about cleaning that seed above.

The seed laboratories at Ottawa and Calgary are prepared to examine samples at any time with a view to advising what sieves to use and where they may be obtained. For such examination samples of from eight to twelve ounces should be submitted. The sender should also state the kind of mill he has.

Red Clover.—Riddle, 1-15 inch perforated zinc. Screen, 4 by 24 woven wire for plump seed and for removing ribgrass; 4 by 26 or 2 by 28 for small seed; 20 by 20 for removing sheep sorrel.

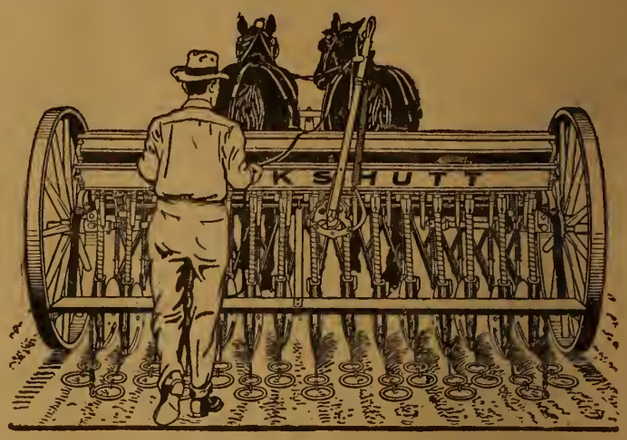
Alsike.—Riddle, ⅛ inch perforated zinc. Screen, 24 by 24 woven wire.

Timothy.—Rididle, 1-20 inch perforated zinc or 22 by 22 woven wire; 1-22 inch if upper shoe of mill can be

You Want Rapid, Perfect Seeding

There is one way to make sure of it, and that is, use a

Cockshutt Disc Drill



With its very strong frame construction—no sagging or bending of the parts. Both wheels are drivers—you sow on corners as well as in the field.

You may buy the best seed and keep your land in good shape, but if you don't PLANT your seed properly your crops will be thin, "spotty" and undersized. Cockshutt Disc Drills plant and cover all kinds of grain at any rate-per-acre you wish. They pulverize the ground, cover the seed and give it every chance for germination. Not a heavy draft machine, despite its tremendous strength. Built in five sizes with either 6 or 7 inch space.

Cockshutt Grain and Fertilizer Drills are wonderfully efficient though very simple and without complicated parts. Fertilizer is drilled into the ground with the seed and covered with it so a splendid, even crop, is assured. The flow of the fetilizer is under perfect control. The whole machine is worked by easy levers and it doesn't take long to understand it thoroughly from top to bottom.

The Cockshutt Disc Drill should be seen to be appreciated. Write for our free Cockshutt Drill Book today. State whether it is a plain grain Drill or a combination grain and fertilizer Drill you want information about. Our nearest agent will be glad to show you how it works.

given a short quick shake; 28 by 28 below for plump seed or for removing worm-seed mustard; 30 by 30 for smaller seed.

Wheat.—**Riddle,** 13-64 inch peforated zinc. **Screen,** 2 by 10 woven wire for chess; 7 by 7 for wild vetch or wild buckwheat, or buckwheat sieve for wild buckwheat.

Barley.—**Riddle,** 18-64 inch perforated zinc. **Screen,** same as for wheat.

Oats.—**Screen,** 2 by 10 woven wire, or 5-64 by ½ perforated zinc.

Flax.—**Riddle,** 3 by 16 woven wire. **Screen,** ½ inch perforated zinc.

Care of Mill

A fanning mill, and especially the sieves, should not be stored where moisture will collect on them. Many granaries are damp and sieves stored in them soon rust out. A good plan is to have a box in which the sieves can be put when not in use. If fitted side by side in such a case sieves can be easily got at without handling over the whole collection. Numbers plainly marked on the upper or outer edge of the frame make it easy to find any sieve required. It pays to take care of machines and other equiipment of the farm, and the fanning mill and its appliances are no exception to the rule.

Hints For Those Intending to Buy a Mill

Choose the mill that will produce the best grade of seed.

See that the mill is well made but do not over-estimate the value of its lasting qualities: a mill that will clean and grade well will pay for itself in a season or two.

The capacity of a mill in bushels per hour should not receive too much consideration. It takes only a few hours, even with the slowest mill, to clean all the seed used on the average farm for the season. Don't sacrifice quality of work for speed. Neither should the power required to run the mill be given too much consideration. Other things being equal, though, the easiest running mill should be chosen.

See that the sieves are well made and fit snugly into the mill so that there is no place into which weed seeds or grain may lodge.

The mill should be easy to clean out when changing from one kind of grain to another.

The ease and rapidity with which the amount of grain leaving the hopper can be controlled is an important matter. It should be possible to shut off or regulate the flo wof grain to the sieves with one hand while turning with the other. If one must stop turning the mill in order to close the hopper, the sieves become flooded and poor work results. It is an advantage for the person turning the mill to be able to see the work the sieves are doing.

Preference should be given to the mill with the simplest and best arrangement for bagging.

It is a great advantage to deal with a firm who will guarantee to see that the mill is fitted with the proper sieves to handle the grain for which it is required. When you buy a mill give the firm to understand you will send them samples of your seed and you will expect them to send the best sieves for cleaning it. If manufacturers would do this, only a few standard sieves need be supplied with each mill. A large collection of sieves supplied with the mill is not an advantage unless they are specially adapted for the work to be done.

FARMERS GETTING TOGETHER

(Continued from page 343)

farm and household questions so as to increase the efficiency and comfort of the farmer and his family.

(c) By promoting social intercourse and the study of economic and social questions through the holding of debates and lectures, the dissemination of literature, the establishment of libraries, and so forth; and by otherwise extending the knowledge of members and their families, with the view of elevating the standard of living in rural comunities.

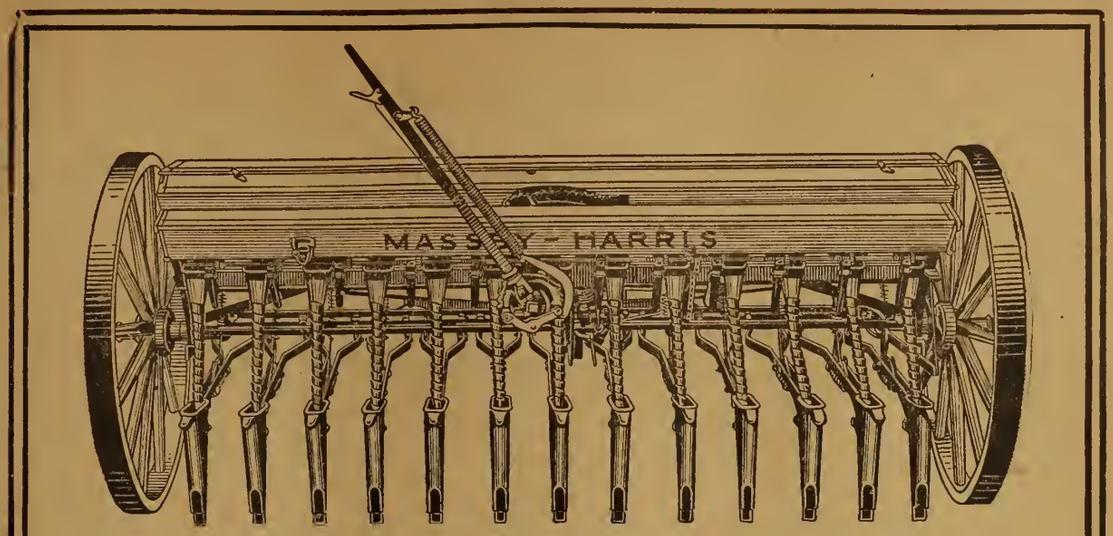
(d) By watching legislation relating to the farmer's interests, and by urging from time to time through duly apointed delegates or otherwise, the passing of legislation required to promote the best interests of Agriculture.

(e) By studying and teaching the principles of co-operation, and by promoting the establishment of co-operative organizations.

(f) By encouraging members to provide suitable halls or meeting places and properly furnish and equip the same for the social and educational benefit of the members.

(g) By endeavoring t o suppress personal, local, sectional, national and class prejudices and thereby to promote the best interests of Canada as a whole.

The Maritime Farmer has been asked to serve as the Official Organ of the United Farmers and has gladly consented to further the interests of the association. Future issues of this paper will contain information relative to the progress being made in organizing, together with particluars of meetings held, etc. Every farmer should carefully follow the progress of this institution. It is one worthy of the sympathy of those who believe that union is strength. The Farmers Union does not contemplate antagonism to any organization designed to benefit the farmers of New Brunswick. It is another step in the "get together movement" which is so much in evidence among the farmers in all parts of Canada. It should be a most useful institution in meeting the "after the war" problems, which will undoubtedly sonfront farmers, as they will affect all interests in Canada. Keep your eye out for the news of the "United Farmers."



The Drill which sows Your Grain as it Should be Sown

A GOOD START is half the Battle —sowing your grain with a MASSEY-HARRIS DRILL is a big factor in securing a good start of grain and a bountiful harvest.

Seed Time is approaching—Are YOU ready? Every day counts—delays are dangerous. Don't take chances with an inferior Drill, but get one which can be depended on to sow your grain right. Get a Drill with a reputation for Reliabilitity under all Conditions—It's better to be Safe than Sorry.

The Reliable Force-Feed Runs sow uniformly in any desired quantity and without injury to the seed.

Strong Steel Frame holds all parts in proper relation to ensure free action of all.

Reliable Force-Feed Run.

Positive Gear Drive.

Simple and easy control —one motion of a Lever lowers the Furrow Openers, applies pressure and starts the feed—the opposite motion raises the Furrow Openers and stops the feed.

MASSEY-HARRIS DRILLS are made in a wide range of sizes and with Hoes, Discs or Shoes. Grass Seed Boxes, when ordered.

BEAN GROWING IN NOVA SCOTIA

(Continued from page 341)

ers and earlier than the Yellow Eye or Soldier bean. Among the pea beans are the small Snowflake Field bean, an early variety of excellent quality and prolific, the Prolific Tree bean, a bean somewhat larger than the Snowflake, and a somewhat large white bean called the medium pea bean. Pea beans are usuallq in good demand on the market and yield better on the poorer soils than do the marrow and kidney beans.

There is also a large white marrow bean, called the White Marrowfat, which has been grown successfully for a number of years near Milford, Halifax County. It is also grown to some extent in the Western part of the Annapolis Valley. This bean because of its white color and the plumpness of the seed and good quality is a favorite wherever it iis known. It is said to ripen fairly early, to be quite free form disease and an excellent yielder. The Agricultural College has a few bushels of this variety for sale for seed.

Fertilizing the Soil

Beans belong to a group of plants called nitrogen gatherers. They, in common with other members of their botanical family, the Leguminoseae, including peas, clover and vetch, have the power of getting part of their nitrogen from the free nitrogen of the air and of adding to the store of nitrogen in the soil. The result is that the bean crop may leave the soil richer in this important fertilizing material than it was before. It is well, however, to have a fair supply of nitrogen in the soil when the beans are planted, otherwise the crop will not get a good start or grow well enough to make much use of the nitrogen in the air. This nitrogen may be provided by plowing under a clover sod the fall before or applying a light coat of manure, say eight to ten tons per acre. If neither of these ways of adding nitrogen is convenient, a light dressing of nitratte of soda, say 50 to 100 pounds per acre, just after the plants are up will give them the needed start. Both clover sod and manure are valuable for the humus which they add to the soil, improving its texture and making it more retentive of moisture.

The plant food which needs to be added in largest quantities to most soils is phosphoric acid. It may be applied in the form of acid phosphate slag or bone meal. Sevey in his book on Bean Culture says: "It seems that phosphoric acid in the form of dissolved South Carolina- rock (acid phosphate) is more likely to give profitable results than the application of any other fertilizing material." If beans do not ripen early enough, or if they ripen unevenly, it may be due to a lack of phosphoric acid in the soil.

Potash is a useful fertilizer for beans on most soils but good results can be and are obtained without making special applications of this material to the soil. The usual commercial form of potash not being obtainable now, it would be well to save and apply whatever wood ashes can be got. Unleached wood ashes contain from 5 to 8 per cent of potash. Potash is also contained in well preserved manure. Some authorities claim that it may be set free from the inorganic material of the soil by the application of lime. Since soils differ greatly in fertility no definite recommendation as to the amount of fertilizer to be used per acre on all oils can be given. This would be a matter to be determined by the owner according to the character of the soil as to productiveness. Good bean crops can be grown by the application of phosphatic fertilizer, such as acid phosphate, slag or bone meal, 400 to 500 pounds per acre and a nitrogenous fertilizer such as nitrate of soda, say 50 to 100 pounds per acre, provided the soil is very well supplied with humus.

The Soil and Its Preparation

Beans require a warm, well-drained soil, and one which does not suffer from lack of moisture. The bean crop is particularly sensitive to external conditions and may readily fail with insufficient heat or with too much or too little moisture. Under the conditions of our climate, with its short growing season, the land for beans should not be too heavy or too cold. A light or medium loam with a southern exposure is more likely to give success than a heavy clay soil, especially if it has a northern slope or is poorly drained. The marrow and kidney varieties of beans are said to require slightly heavier and richer soil than do the pea beans. The latter will give heavier yields than the marrow and kidney beans on light and relatively poor soil. But in this Province where the natural conditions are not always most favorable for bringing a crop of beans to maturity the greatest care should be exercised in the selection of the most suitable soil and in its preparation.

Beans, may come in the rotation after clover, or they may come after potatoes or other hoed crops, provided there is sufficient humus in the soil. A clover sod provides humus in the soil. A clover sod provides humus and nitrogen. A hoed crop, such as potatoes or corn, leaves the soil in good condition for the preparation of a seed bed.

Beans to succeed best, require a continuous supply of moisture throughout the growing season. If the soil becomes very dry at a critical time it will greatly lessen the yield. The

Are You Working for the Machine *or* Is the Machine Working for You?

No one wants to be bossed by a bell, or chased by a speedometer. Fixed-feed separators are hard taskmasters, unless cream waste means nothing to you. How much better it is to have your separator skim clean at any speed—working *for* you, not against you. Only one separator does this—the Sharples suction-feed. It skims equally clean at all speeds, averaging a saving of 10 lbs. of butter per cow yearly over any other separator. Every time you turn a Sharples you are saving the butterfat that will help win the war.

SHARPLES SUCTION-FEED CREAM SEPARATOR

—the *only* separator that will skim clean at widely-varying speeds

—the *only* separator that gives cream of unchanging thickness—all speeds

—the *only* separator that will skim your milk quicker when you turn faster

—the *only* separator with just one piece in bowl—no discs, easiest to clean

—the *only* separator with knee-low supply tank and once-a-month oiling

Remember—Sharples is the *only* separator that automatically prevents cream losses, and doesn't rely on human nature. Write for catalog today to nearest office, addressing Dept. 79

grower can, to a certain extent, guard against this danger by preparing the soil so that it will absorb the maximum amount of rainfall during the dormant season and by practising proper after-tillage so as to retain this moisture as much as possible. Fall plowing is an advantage in that it makes the land earlier in the spring and puts it into a condition to better absorb and hold moisture. If the land has not been plowed in the fall it should be plowed and harrowed early in the spring, or at least three weeks before the time of planting. It should receive several harrowings at interval of a week or so in order to bring it into good tilth, to give the air admision and to retain the moisture and to kill as many weeds as possible before the beans are planted. If this work is properly done the beans will grow much better htan they otherwise would and it will greatly lessen the necessary tillage later. Much of the tillage for this and other hoed crops could be given before the crops are planted and would be done much more cheaply than after the crops are up.

Planting

Beans should not be planted until after settled warm weather arrives and danger of frost is past. In Nova Scotia they are planted from the first until the 20th of June. Some growers in the Annapolis Valley claim that the best results follow from planting during the first week in June. Beans are often planted too deep. In light soil they should not be covered more than two inches, in heavier soil one inch is enough. The rows should be placed 28 to 30 inches apart and the seeds about three inches apart in the row.

About one bushel of medium sized beans is reuired to plant an acre. Of the smaller kinds, such as the Snowflake pea bean, half a bushel is sufficient. One pound of the Early Yellow Six-weeks, a medium sized bean contains about 350 seeds. Planted four inches apart these would occupy about 176 feet of row. Probably to allow for loss by insects, diseases and accidents the usual recommendation is about twice this amount, or 1 uart to 162 feet of row. Usually beans are planted too thick and are not sufficiently thinned to allow the plants to properly develop. Having the plants too thick in the row favors the development of bean diseases and delays ripening. Plants of those varieties which grow to average size should be thinned to about 8 or 9 inches apart in the row.

Where the beans are grown on a large scale the planting is sometimes done by means of a grain drill, a sufficient number of tubes being stopped to bring the rows the right distance apart. Special bean planters are made for planting this crop. The ordinary garden seed sower may be used for small areas or the land may be furrowed our with a small plough and the beans dropped by hand and covered lightly with a plow or with a hoe. In small garden areas the drill may be made by drawing the corner of the hoe along a tightly stretched garden line and the beans covered with the hoe.

Cultivation should be frequent and fairly deep early in the season and shallower later in the season. Deep cultivation late in the seasou is liable to cut off or disturb the roots of the plants. Cultivation should be given only when the plants are dry, otherwise the spores of anthracnose will be scattered through the crop and much injury result from the disease. Usually about four or five cultivations are suffirient for the crop and many bean crops are grown with only two or three. When the soil has been thoroughly prepared so as to be in good tilth, moist and free of weeds, the bean crop can be and is sometimes grown without any cultivation.

Harvesting

In countries where the beans are grown in large areas they are harvested by bean pulling machines. In this Province they are pulled by hand and left in small bunches for a short time until thoroughly dry. They are then either stacked outside or hauled immediately under cover. When grown on a small scale, as in this country, they are thrashed by hand. If thrashed in the fall they should be spread uot and thoroughly dried before they are put into storage. The thrashing is often deferred until a convenient time in ithe winter. In this case the beans do not need so much care in drying before going into storage as whn thrashed earlier.

Yields

The average yield of beans is from fifteen to twenty bushels per acre. Occasionally a yield of from 30 to 40 bushels is obtained.

Antracnose

One of the worst diseases with which the bean grower has to contend is anthracnose. This is a bacterial disease which attacks the stem, the leaf, the pod and the seed of the bean. It produces an appearance on the bean like rust, but is not the same disease as bean rust. The disease may exist in the bean or in the soil and thus be carried over from the crop of one season to that of another. When infected seeds are planted the young plants from these seeds become diseased and from these diseased plants the infection may spread to the whole crop if the conditions are favorable for such spread. One good remedy for anthracnose is to plant clean seed on ground free from the disease and to cultivate the crop only during dry weather. If the foilage is wet from rain or dew the spores are readily sprad to healthy plants when worked among in hoeing or cultivating.

Hand selection of seeds in the ripened pod is the best way in which to get clean seed. Pods that show no trace of the disease should be chosen. It is conidered advisable also to select the longer pods containing the largest number of seeds in order to increase

A Truck for the Farmer

FARM equipment which will effect a time and labor-saving, and therefore a money-saving, must be carefully considered by every good farmer now-a-days.

The farm wagon, which for years was the most useful of all farm equipment, is now being replaced on the best farms by a sturdy, dependable motor truck. The truck will haul any farm product—fruit, grain, vegetables, stock, fertilizer, or wood—around the farm, or to the town or city many miles distant, in half the time, and at a much lower cost.

The Ford One-Ton truck is a rapid, economical and very serviceable means of transport. One of these on your farm will save you weeks of time in a single season and will enable you to pass through a crisis of labor shortage with less difficulty.

The Ford truck is supplied as a chassis only. This permits you to select any of the many body styles especially designed for the Ford truck and already on the market. Thus you can mount the one which suits your individual requirements.

Price $750 f.o.b. Ford, Ont.

See any Ford Dealer in Canada, or write for a catalog

Ford Motor Company of Canada, Limited
Ford, Ontario

Three of the many body styles that may be mounted on the Ford truck chassis

the productiveness of the strain.

The Horticultural Division of the Agricultural College will be able to supply a limited amount of seed beans of the earliest varieties to growers in 1918. Intending bean growers are advised to get their seed from the nearest source providing the beans are good and of the right variety. It is not the intention of the Department of Agriculture to interfere in the least with the regular trade but the object has been to save some of the best secd beans from being consumed as food by buying and holding these in reserve in case teh usual supply becomes exhausted. The beans at the Agricultural College will be available to seed merchants and dealers as well as to growers at cost price.

CARE OF MARES BEFORE FOALING

(Continued from page 363)

it can be avoided by attention and care.

Prior to the birth of the foal, mares should have enough of good wholesome food and water; plenty of exercise; clean, light and altogether sanitary quarters along with regular attention directed or given by a man who likes horses and who looks after this matter not from a sense of profit and loss alone. but because of human interest and duty.

On the average farm the problem of exercise is not troublesome. The great difficulty is to find help that will handle brood mares carefully. Brood mares may work up to within two or three days of the date of foaling, and be benefited by it. They should be given moderate but steady work. Such mares should not be given work which requires backing heavy loads, or where there is a chance of slipping. But they can and should be wroked.

Feed for this class of horses should always be of the best quality and of such a composition that it will not cause digestive trouble. As a geenral rule mares doing light work should eat approximately ten lbs. of hay and one lb. of grain per day per 1000 pounds live weight. This matter should be governed, however, by the condition of the mares and they should be gaining in condition with digestion in the best of condition as the critical time approaches.

Mares should be given a box stall at least four weeks before they are due to foal, in order that they become accustomed to it, and may also have a place large enough to be comfortable during the night. The stall should at all times be kept clean and well bedded, but particular care should be taken regarding these details when the foal is born. If truly known the source of navel trouble in foals is generally a dirty stable or yard. As a safeguard against "navel disease," besides the scrupulously clean stall, the navel should be tied and treated with a strong disinfectant, such as a solution of carbolic acid.

If the season of the year and other existing conditions permit, mares may well be allowed to foal on grass which lessens the danger of infection.

KEEPING BREEDING RECORDS ON FARM

(Continued from page 351)

have seen them with simply the date and day without the day number. These day numbers help a great deal in detremining the end of the gestation period because with them you simply have to add the number of days in the gestation period instead of counting each page as would be necessthy without the day numbers. The standard which holds the pages that can be used year fater year costs from 75 cents to $1.00. The filler, or pad, costs 50 cents for each year. That may seem a little expensive but if it is the means of saving one pig the profit on the one pig will keep you pads for the next ten years.

Besides keeping breeding records other dates of importance can be indicated. The dates of maturity of notes can be inidicated on the proper date and prompt settlement can be made. This will establish credit with your banker. Dates of sales that you wish to attend can be indicated. In fact, a complete and useful diary can be had year after year if one cares to set down important events from day to day. These calendars are necessary equipment to a business man in the city as as we farmers are being more and more regarded as business men we shrould endeavor to encourage the idea by using business-like methods.—C. H. GREEN.

THE HOME VEGETABLE GARDEN

(Contineud from page 347)

heavy shade, such as corn, should not be where they will shade small sun loving plants. Potatoes and sweet corn need about the same amount of space and will go well together. Cucumbers, squash, etc., should be grouped. A variation in the type of soil will decide to some extent the location of certain crops. If part of the land is low and moist it should be devoted to such vegetables as celery and onions. If part is high, dry and warm, that is the place for early crops.

The secret of obtaining large quantities of vegetables from a small area lies in the fact that in some cases two crops may be grown in one row at one time, for example, lettuce and radish parsnips and lettuce, corn and pumpkins, lettuce and early cabbage, etc. Also, that as soon as an early crop is harvested it may be replaced by a crop which will be ready for harvesting before the fall frosts. This is called successional planting, exapmles of which are, peas, early beets, radish and lettuce, to be followed by turnips, beans, carrots, cabbage, cauliflower, late beans or tomatoes. The mistake is often made of sowing the different vegetables only once, whereas two or three plantings of the same vegetables made at intervals of 10 days or so will extendthe season for them. This result may also be partially obtained by planting at the same time varieties dieffrering in the time they require for maturity.

What vegetables to grow, varieties to select and seed required, will be considered in the next article.

"Give up hoping that this can be a short war. Plan and provide for an ever-receding duration of at least two years more.

"If we all do so, peace may one day surprise us. If we do not, there will b eno peace and no freedom, but only a postponement.

"There must be no postponement and no 'next time.'"—Sir Eric Geddes.

Work your hens hard for all the whole grain they get by scattering it on the floor—in the ilter is so much the better.

THE WHITE-MARKED TUSSOCK MOTH

A severe outbreak of this insect next summer is indicated by the large numbers of white egg-masses spotted over the trunks and branches of shade trees in many of our eastern towns and cities. The habits of this injurious insect and the most effective methods for its control are discussed in Circular No. 11, recently issued by the Entomological Branch of the Department of Agriculture, written by Messrs. J. M. Swaine and G. E. Sanders.

The species is native to this country and occurs periodically in extensive outbreaks, particluarly in the regions bordering the Great Lakes, the St. Lawrence River and near the Atlantic coast. It is notably a pest of cities and towns, but is injurious everywhere to shade trees in times of abundance; and it is also an important enemy of apple trees, since, in addition to defoliating the trees, the caterpillars feed upon and destroy the young fruit.

The details of the control methods as applied to both shade trees and apple trees are discussed in detail in the circular. Copies of this circular may be had free on application to the Publications Branch, Department of Agriculture, Ottawa, and requests for the circular may be mailed free. All inquiries regarding insect pests should be addressed to the Dominion Entomologist, Department of Agriculture, Ottawa, and no postage is required on such letters.

A TRANSFORMATION

"Mr. A. C. in 1915 sold some poor cows again in 1916 he sold his five poorest; he has fed better, has put in a silo, and has a good sire. From being one of the poorest dairymen in the section he will now rank among the best." So writes a keen observer of dairy progress in Quebec.

From a yield of 3,021 lb. milk in 1915 the above dairyman increased the production of ten cows to 6,246 lb milk and 236 lb. fat in 1917.

How did he know which cows to keep, which cows to sell? The answer is very simple. He kept dairy records weighing the milk of each cow night and morning every tenth day right through the lactation period, so that there was no mistake about it. He also found that it pays to feed well and grade up.

Consider that milk yield a moment; from three thousand up to over six thousand pounds, doubled in three years; what a transformation. That's real encouragement, better returns for labor, more cash, more home comforts, more real use to humanity.

Yes, of course his experience can be duplicatetd. Just write to the Dairy Commissioner, Ottawa, for milk record froms, they are free, and get started weighing right away, as soon as the first cow freshens.

NEPONSET ROOFS

NEPONSET PAROID ROOFING — NEPONSET TWIN SHINGLES

Every Farm Needs Paroid

PAROID should roof every building on the farm—from the big barn to the pig pen and poultry house. It pays in dollars and cents—first, because of the vigorous resistance to rain, wind, heat, cold and fire; second, because of the many years Paroid lasts.

NEPONSET
Paroid
ROOFING
Saves You Real Money

Do all your roofing or roof-repairing this year with Paroid—made in Grey color—two weights; also with Red or Green crushed slate surface.

But be sure the roll roofing you buy IS Paroid! Some people have the idea that any roll roofing is Paroid. If you don't get the genuine article you pay for your mistake.

Look for the Paroid roll as shown. Sold by hardware and lumber dealers.

We recommend Neponset Twin Shingles for Residences.

Happy Farmer Tractor handling 3 bottom 14 inch plows backsetting Timothy Sod

Thirty-One Cents an Acre!

At Brandon the Happy Farmer demonstrated its ability to plow an acre in 45 minutes at a cost of only 31 cents worth of coal oil! Compare this with the cost of plowing an acre with your best team, with feed at high prices, and men's extra time to be counted in. Will it not pay you to use the

Happy Farmer Tractor

Model A—8-16 Horsepower. Model B—12-24 Horsepower.

Here is the ultimate tractor for efficiency and economy combined! It is famous for its simplicity—few parts to get out of order. Any intelligent farm lad can run it. It is heavy enough for the hardest plowing test and for heavy hauling—light enough to use with the drill. And it will go anywhere; it will plow right up to the fence with no unfinished corners. It will turn in its own space and not mire in soft spots.

Model B's engine is not just "adapted" to coal oil. It is designed *specially* for kerosene. It burns it perfectly—all of it—with no smoke nuisance and no carbon trouble. Model B will not only pull the plow and the binder, getting your work done early in critical times, but it will deliver 24 horsepower for all kinds of belt work at low up-keep cost.

If you prefer a lower power tractor, Model A supplies the need.

Write us for full particulars about price, delivery terms, etc. Literature free on request.

Tried, Proven and Endorsed

The Government of Canada, realizing the increasing difficulties which the farmers of Canada are facing through labor shortage, have carefully examined the help problem on the farm with the idea of eliminating extra work and drudgery.

Here is the Government's answer to every farmer and dairyman: "A partial solution of the labor problem is the milking machine."

Empire Milking Machines have been used for over three years on the Government Experimental Farm at Ottawa,—and in view of their past performance, the Dominion Government has now placed an order for six more Empire outfits to be installed on the following Experimental Farms: Fredericton, N. B., Lennoxville, Que., Cap Rouge, Que., Ste. Anne de la Pocatière, Que., Lacombe, Alta., Brandon, Man.

EMPIRE
MILKING MACHINES

Actions Speak Louder Than Words

Empire Milking Machines are a good investment as they enable one man to do the work of three hired men in the same time. A boy can operate an Empire with ease.

Empire Milking Machines can be installed and operated at small cost,—the initial investment soon being paid for in time and labor saved.

The cost of operating an Empire for one year is just a fraction of the cost of boarding the hired man, aside from his wages—in one year, your saving is enormous.

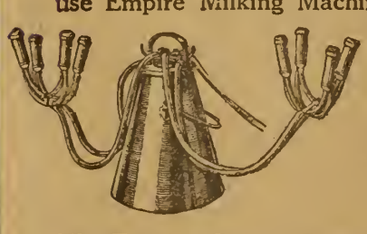
Empire Milking Machines milk in Nature's way. The action of the teat cups is that of the sucking calf, massaging the teats from tip to udder, gently and uniformly—the same way at every milking.

The experience of thousands of farmers and dairymen is: that cows and heifers take readily to being milking by an Empire. The soft, gentle massaging of teat cups sets up a pleasing sensation which causes the cow to give down readily and stand content while being milked. Empire Milking Machines will lengthen the cow's period of lactation.

Empire Milking Machines are easy to care for. Simple in construction, these machines do their work with speed and efficiency and can be operated by man, woman, boy or girl.

We know of no Empire Milking Machine that is not giving absolute satisfaction and doing all we claim it will do.

Dozens of other farmers and dairymen, just like yourself, use Empire Milking Machines and cannot say enough in their praise of the machine and its value to them.



Information saves money so write us today for booklets, testimonials and detailed particulars.

THE MILKING MACHINE

A PARTIAL SOLUTION OF THE LABOUR PROBLEM

They will take the place of that extra hired man so hard to obtain at the present time. *Unlike that hired man they are always there ready for work.* Their work is noted for its uniformity from day to day. Milking machines are now recognised.

AS A GOOD INVESTMENT

One man with a milking machine can milk twenty to twenty-five cows per hour. This number would take three men at hand milking. The real drudgery of the dairy farm is eliminated by the use of the milking machine.

INTRODUCTION The object of this circular is to put before the dairy farmer the value of the mechanical milker under the present conditions of labour on the farm.

There has been in the minds of many dairy farmers a great deal of prejudice against the use of a mechanical milker, but the present is no time to let prejudice stand in the way of increased production.

Every dairy farmer with a herd f 12 or more cows should consider seriously the installation of a milking machine.

The experience of an ever-increasing number of practical farmers, coupled with that of a number of our Experimental Farms and Stations, goes to prove that these machines are decidedly advantageous.

COST OF INSTALLATION The average cost of installation, taking into consideration the five most popular machines on the market, would be about $500 for an outfit to milk four cows at once.

Such an outfit would be large enough for a 25- to 35-cow herd.

For a 20-cow herd a 3-cow outfit would be sufficient. For a 12- to 15-cow herd a 2-cow outfit would be sufficient.

For each reduction of one unit in the installation there will be a reduction of approximately $100 in the cost price.

This briugs the average cost price to $16.60 per cow for the large herd; $20 per cow for the medium-sized herd; and $25 per cow for the small herd.

This in turn goes to show that while the cheapest installation for work done is with the large herd, nevertheless the first cost is not excessive in the case of a small herd.

COST OF OPERATION The annual cost of operation for a 25- to 35-cow outfit, including repairs, power, labour in caring for engine and washing machines, interest on investment, and ten per ceut depreciation on machine, would amount to approximately $225.

The above is approximately one-third of what the farmer is at present paying his hired man, where board is not taken into account.

Divided between 30 cows, this brings the running expenses to two cents per cow per day.

ABOVE COST COMPARED WITH COST OF HAND-MILKING The average hired man will not milk more thau seven cows per hour, which, at 25 cents per hour, costs 7.2 cents per cow per day for hand-milking. One man with a milking machine can milk 20 to 25 cows per hour, which brings the total cost of machine-milking, including the above-mentioned daily running expenses, to 4.5 cents per cow per day.

This is a saving of considerably over one-third and in a large herd would enable the farmer to dispense with a least one, if not two, men, or it would liberate these men for other important lines of increased production.

It also enables one man to milk many more cows than it is physically possible for him to milk by hand.

UNIFORMITY IN MILKING Not only does a machine decrease the cost of milking, but it gives uniformity in milking. All cows are milked in the same manner every day, and every good dairy farmer kuows this is important and that it is hard to obtain with the general run of farm hauds.

RELIABILITY OF SERVICE A machine when properly installed and equipped with a reliable source of power is always there ready for work.

Breakdowns are comparatively rare and usually easily remedied.

Wear and tear is not excessive, considering the nature of the machiue, and provided the latter is given proper attention.

EFFECT ON COWS A machine that is properly adjusted and handled will not injure the cow's teats or udder any more than the average farm hand.

Three years' experience of mechanical milkers on the Central Experimental Farm does not show that the cows dry off any more quickly than when milked by hand.

There is no more, if as much, objection to the milking machine on the part of the cows than there is to hand-milking.

Old cows used to hand-milking object most, and may not let down their milk readily, but heifers take to machine milkiug like ducks to water and require hardly any stripping.

Stripping by hand after taking the machine off is advocated by all users, as well as makers, as a precautionary and economical measure.

EFFECT ON QUALITY OF MILK If the machines are properly handled in the barn, and likewise properly washed in the dairy, the milk produced will be as good, or better, than that produced by hand-milking.

Where extra pains are taken with the machines and the care of the milk a very high grade of milk can be produced.

Careless handling results in bad milk and ultimate failure of the machiue.

IMPORTANCE OF EFFICIENCY IN OPERATION Last, and of far more importance than the cost price or make of the machine, comes the question of the efficiency of the operator.

Handling the machine is a job for the farmer, his sou, or some hired man who has an interest in the success of the machine and the cows.

For best results the operator must be quick and quiet, with an eye for details.

Know the machine and the cows, and adapt the one to suit the other, giving each their proper share of attention at the proper time.

Any of the more prominent makes of milking machines upon the market will do good work provided they are properly handled.

The addresses of the dealers or manufacturers of the various machines can be procured from the farm journals, or upon application to the Animal Husbandry Division, Experimental Farm, Ottawa.

N. B. Farmers and Dairymen in Annual Session

The forty-second annual convention of the New Brunswick Farmers' and Dairymen's Association was held in the City Hall. Fredericton, on March 12, 13. 14 and 15th.

Isaac W. Baird. the President, occupied the chair.

Never in the history of the N.B.F. & D. A. was there such a well attended series of meetings and never did the various delegates get down to work so seriously as they did this year.

Increased food production to help win the war was the dominating factor in nearly all the addresses.

The reports submitted by the various County Vice-Presidents were brim full of assurances re the willingness with which the agriculturists of every County in the province are preparing to do their utmost during the coming season so that there will be enough food and to spare.

The President's address was brimfull of sage council.

The delegates were given a cordial welcome to the city of Fredericton by His Worship Mayor Hanson in a neat and to the point address.

H. H. Smith, the silver tongued orator of the Association, replied in a few well chosen words and then the Convention settled down to listen to a practical address by Hon. J. F. Tweeddale, Minister for Agriculture, who dealt in a forceful manner with present day probems from the agriculturists point of view, in connection with winning the war. The Minister has been very active in endeavoring to get as many farmers and farm laborers granted release from militiary duties to grow the food that can and must be produced here. He has been in conference with the premiers and ministers of agriculture of the respective provinces of Canada at Ottawa and is fully impressed with the fact that labor and increased production are inseparable allies. The question of politics does not enter into conferences of this kind. Every one must put their shoulders to the wheel and produce food to the exclusion of the question of profit. The farmers of New Brunswick must produce to keep our soldiers going. Our soldier boys have and are giving up all that was dear to them in life and their future prospects to safeguard us against such ignominy as the enemy has perpretated in Belgium. Were it not for the grey monitors of the British navy that daily stand guard over the entrance to the Kiel Canal there would have ere this been ravages committed on our fair shores similar to those in long suffering Belgium. The Minister outlined some of the activities of his department and placed himself on record as being open for an interchange of ideas.

Dr. Keirstead, Provincial representative of the Canadian Food Controller followed with one of the most masterful addresses that was ever presented before the N. B. F. & D. A. He pictured conditions as they exist and are liable to be for some time to come. As the eloquent doctor drove his argument home point by point he carried his audience to heights of enthusiasm that omens well for the food production campaign during the coming season.

The reports of the County Vice-Presidents were read and filed for future reference, after which the President named the committees and the meeting adjourned at 11 p. m.

The Wednesday Sessions

"Sheep Raising and Co-operative Marketing of Wool" was the subject of a well prepared address by Thos. Hetherington. B. S. A., Live Stock Superintendent for N. B. Mr. Hetherington had a thorough grasp of his subject and was closely followed with keen interest by the audience. He explained the co-operative marketing of wool plan which is being heralded in every section of the province with a view to secure for the farmers the best known facilities for disposing of the wool clip at the best possible prices. There will be a centre at Moncton and another at Fredericton during the coming summer and wool growers who have their own best interests in view will plan with their neighbors to market their wool through the co-operative associations.

J. Thompson, of the Sheep and Goat Division, Ottawa, also talked co-operative marketing of wool.

A. C. McCulloch, B. S. A., Poultry Superintendent for New Brunswick, delivered an excellent address on Poultry Raising, in the course of which he gave some very practical suggestions which, if followed, will mean a great increase in the poultry products and the money derived therefrom on the farm.

On Wednesday afternoon C.L. Smith of Woodstock, accompanied by several other farmers, were present as a delegation to make announcements re an organization which they have organized in Carleton County along the same lines as the United Farmers of Alberta and kindred associations. Their aim is to make the society province wide in scope and finally to link up with similar organizations from the Atlantic to the Pacific. More co-operation is their aim and their motto is "Equal Opportunities for All."

The delegation was favorably received and before leaving the hall they were tendered a unanimous vote of thanks for the work they are doing.

The remainder of the afternoon was taken up with addresses and discussions on Fertilizer Facts and Falacies by B. Leslie Emslie, Ottawa and a report on Co-Operative Test Plots of Potatoes by J. R. Brownlee, Dominion Plant Disease Inspector, Fredericton.

G. C. Cunningham, B. S. A., Plant Pathologist, was heard for a short time on the question of Potato Diseases and Seed Disinfection. The foregoing addresses were timely and the great number of questions asked evidenced the interest the farmers took in these subjects.

Breeding and Feeding of Dairy Cattle was the subject of one of the best addresses ever delivered before the Farmers' and Dairymen's Association. The subject was ably dealt with by Prof. J. M. Trueman of the N. S. A. C. Prof. Trueman is always sure of a hearty welcome by the New Brunswick farmers who appreciate the practical suggestions he usually has to offer. We believe some of the suggestions offered by Prof. Trueman will long be remembered very advantageously by the delegates.

A. J. Gaudet, of the Cow Testing Association, spoke to his compatriots in French for a short time, after which J. D. McKenna, Manager of the Maritime Farmer, Sussex, spoke in no uncertain tones on the subject of co-operation. Mr. McKenna has been doing good work in securing cheaper feeds for the farmers of the Maritime Provinces. He has not, however, found it altogether easy sailing and he has had to fight the combines that so frequently hamper co-operative movements. He has interviewed the Food Controller's staff and other men in authority with but little success. He persisted in his efforts until finally the importance of the cause he agitated received recognition and as will be noted in an extract from a letter recently sent to Mr. McKenna by the Food Controller, which we published in our last issue, the time is near at hand when the farmers of the Maritime Provinces will have to thank Mr. McKenna for a redress they long looked for but hitherto were unable to obtain with any degree of certainty.

The Thursday Morning Session

Mr. McLane of the Entomological Branch, spoke for a short time Thursday morning. He referred to the losses that insect pests occasion in this province and offered any assistance from his department in suppressing these pests. He advised farmers to notify him when any insect pest put in an appearance in their respective communities so that steps towards control might be taken.

W. R. Reek, Deputy Minister for Agriculture, spoke on the question of Greater Productoin and outlined some of the main ways in which farmers who are short handed on labor may accomplish good results by being long headed. Plan and prepare early so that there will be no delays when the soil is ready to work and sow was the key note of his address.

Prof. Grisdale and a number of farmers in the audience took up the discusson and many practical suggestions were presented.

The Resolutions Committee reported on the following resolutions which were adpoted:—

* * *

Resolved that the Legislature of the province be asked to amend the Act relating to the Protection of Sheep from Dogs so that all parts of the province, not included under the presnet Act, such as towns and cities, be placed under the existing taxation clause and further that all dogs be securely confined or tied from sundown until sunrise.

The foregoing resolution was accompanied by a widely ciruclated and signed petition from residents of the parish of Moncton.

* * *

Resolved tht this Assocition wishes to extend to the Department of Agriculture their hearty appreciation of their work on behalf of the people of New Brunswick. We also wish to express our faith in Mr. Reek as Secretary for Agriculture feeling that he has alredy proven himself to be the right man in the right place.

Further resolved that we, as farmers of New Brunswick, pledge ourselves to co-operate with the Department of Agriculture and to assist them in every possible way in carrying out their all-important work.

Moved by L. M. Anderson.
Seconded by H. J. Allen.

* * *

Whereas an agitation known as Daylight Saving is being promulgated and believing that such a scheme is not in the best interests of the Province in general and the farmers' in particular by making it almost impossible for them to procure adequate labor that will work during the hours when best results can be accomplished on the afrm; therefore resolved that this New Brunswick Farmers' and Dairymen's Asscoiation, at Fredericton assembled place ourselves on record as being opposed to such legislation.

Moved by W. H. Huggard.
Seconded by R. E. Floyd.

* * *

Resolved that this Association believes it to be in the best interests of both producer and consumer of dairy products to immediately upon the conclusion of the war, rescind the present Order-in-Council which allows as a war measure only the importation, manufacture and sale of Oleomargarine in Canada and respectfully petition the Federal Government to again put into force the restrictions against oleomargarine as they appear in the Dairy Industry Act.

Moved by Jas. Bremner, Jr.
Seconded by W. H. Huggard.

* * *

Whereas the Department of Agriculture of New Brunswick has offered to procure tractors for the farmers of this province at a cost of about $800.

And whereas this price is beyond the reach of the ordinary tiller of the soil and not practicable on the average farm,

Therefore resolved that this convention of Farmers and Dairymen urge upon the Government to fall in line with that of Nova Scotia and give a bonus of 25% on all gang plows bought and thereby help the great majority of farmers on the work for greater production.

(Continued on page 378)

Save Canada, Britain and Her Allies

Tremendous Increase in Production Needed

There never was a time in Canada's history when it was so essential in her citizens to become directly interested in the question of food production. Every man, woman and child in Maritime Canda are interested either directly or indirectly in the food production problem. The number of those who are indirectly interested should become directly interested this season to the exten of assisting whenever and wherever the occasion presents itself.

This is no time for idle quibbling. It makes no matter what a man's occupation, creed or political affiliation, his duty is to work with might and main for the common cause. The ridiculing of earnest effort to be of service to the Empire in this "Win the War" movement is nothing short of pro-German. Any attempt to sow dissentions or to foster a lack of confidence in men who are directing affairs of this kind honestly and well, by parties who have a political game to play is a dastardly move. The German nation has been able to defy the world up to the present time because her people are united in their efforts for their comon cause. Internal dissentions have proven disastrous in Russia. We have had disturbances in Canada as well as in other parts of the British Empire that do not help but rather hinder our success.

The call comes to us urgently and insistently to produce so that there will be enough food and to spare when the year' harvests are garnered.

If we grow no more and eat as much there will be privation and again privation, imperilling our cause and weakening our people. There is not enough food in sight or possible of production to let us be free from dangers of famine before 1920. We face a situation that is simply appalling.

The Maritime Provinces are asked to crop at least 400,000 additional acres during 1918. To succeed in this every pair of hands is needed. The man who cannot use the whole of his time to attain this objective should plan to give at least a part of his timo.

In order to attain the foregoing objective Dr. Jas. W. Robertson, Chairman of the Dominion Food Production Committee, in the course of his organization tour in the Maritime Provinces met the members o fthe New Brunswick Legislature and representative delegates from all parts of the Province in the Legislative Assembly Hlll, Fredericton, on Tuesday, March 26th, when he delivered his message to the farmers of New Brunswick.

In introducing Dr. Robertson, Hon. Mr. Tweeddale, minister of agriculture, said:

"I am sure the members of both sides of the house will welcome this opportunity of hearing Dr. Robertson, whose mission here is in consequence of the wide knowledge he has of the conditions resulting from the war.

"No man in Canada is better qualified to deal with the subject, because of the wide knowledge he has of conditions, having personally visited the trenches, and having seen and studied the devastation saused by the ravages of war in the town and villages, as well as in the agricultural districts of France and Flanders.

"Since about a year ago those reponsibe for the successful conduct of the war began to realize that the food situation was one of the most serious problems of the war. We were then asked to put on a campaign to bring the people of the province to a more intelligent knowledge of the existing conditions, and at once organized the province by inviting prominent men from every county to a large convention in this city. A ofrceful appeal for greater production was read from the pulpits by the clefgy of the province. A provincial committee was appointed at that convention, and has been working in harmony. This committee has done godd work and is a standing committtee today, making considerable sacrifice of their valuable time and energy.

"Subsequcntly we learned that while the British government wished to conceal from the enemy that they were weak in the matter of food supply it becamc necesary to make it known, in order to remedy the condition, and word was passed along from the imperial authorities, that the fighting forces in the trenches threatened to lay down their arms as the civil population, their families, were starving.

"Immediatetl the wheat from the elevators of Canada and the United States was rushed to the nearest port of shipment, and as fast as bottoms can be secured, is being sent overseas, so that, before it grows again, there may not be a pound of wheat left ot the surplus. The provincial department of agriculture at once summoned the municipal councils asking them to so-operate, believing that the situation was so serious that all public bodies should assist, that with the other provinces working along the sme lines, the weight of the nation would be thrown into the work.

"It is estimated that five times the surplus produced in Canada and the United States will be required next year to sustain the fighting forces at the front, as well as the civil population cf the Allies overseas.

"Conventions were called at Ottawa asking the premiers and ministers of agriculture from the provinces to meet to get an interchange of ideas, so they would be enabled to determine on an intelligent policy.

"Increased production involved labor supply and, a committee of the convention in making up that upply, ecommended that farmers and farm laborers of the draft under the military service act, should be given leave of absence, so long as they are engaged in farm work. In accordance with that recommendation the government established a leave of absence board with one agricultural representative who are now in session passing upon the claims of those claiming exemption under the order, in the city of St. John.

"It was also suggested at the conference that the Dominion government should make a money appropriation to assist the provinces in their expenditures, in carrying out the work, which was done, and the appropriation was made $25,000 being the amount granted this province. This will be explained by Dr. Robertson, whose business here is to organize the work, acting for and in the interest of the Dominion government."

Robertson's Address

Dr. Robertson spoke as follows:

I thank you for the opportunity of this occasion, I am here as the representative of the dominion minister of agriculture and the Canada food board to co-operate with the provincial authorities in completing definie plans for an immensely greater production of foods in New Brunswick in 1918. This is necessary to help save the situation which is becoming so serious as to threaten disaster to the cause for which we are fighting. Before this representative gathering mine is a simple duty. I do not regard it as a light duty or one easy to discharge. I am not to persuade you or to stir your emotions or attempt to deepen the fervor of your devotion to patriotic causes. I am to serve you and the people of New Brunswick by helping you to understand and again to understanad that the scarcity of suitable foods has made the war situation exceedingly grave on the side of the Allies. The shortage is most severe in Italy and France. In 1917 the yield of wheat in France was only about forty-seven per cent. of the average quantity obtained annually before the war broke out. The same was true of the crop of potatoes. The yield of all food stuffs in France in 1917 was estimated at only sixty-two per cent. of the yield of a normal year before the war. France and Italy are short of wheat and fiour and fats. Great Britain has been sharing her imports with these two allies while the scarcity is still greatest in France and Italy, the allowances of foodstuffs in the United Kingdom have been greaty reduced. Beef and mutton have been cut down to fifty-five per cent. of the pre-war consumption and wheat to about fifty per cent. Bread is kept cheap as a war measure although the quantity is down to the bare sustenance limit.

Bread in Britain Cheap But Scarce

Gerat Britain has provided cheap bread for the people in all her towns. How does she manage to do it? She buys our flour and wheat and pays the prevailing high prices; and yet in England you can buy bread for 4½c. a pound, while in Ottawa you cannot buy it for less than eight. Therefore, says the every ready critic of food control, "We are suffering from profiteering all along the line in Canada." That is not a just conclusion. It does not tally at all with the facts. England buys our wheat an has it ground in mills which she control. She mixes the flour with fifteen per cent. or twenty-five per cent. of rye or corn, or barley; and then sells that diluted flour to the bakers at a price which allows them to sell bread at 4½c. a pound, and requires them to sell it at that price regardless of the cost to the government. The government subsidizes the bread industry from the public revenue as a war measure in order that the proper people may obtain cheap berad. The cost to the British treasury was estimated at $200,000,000 last year.

The Allies Look to Canada

The equirements of the Allies, for 1918, of the five cereals or their products—wheat, barley, oats, rye and Indian corn—amount to 360,000,000 bushels more than they required to import before the war. That quantity is equal to sixty-one per cent. of an increase over the annual average of their requirements of these food commodities before the war. Where are the Allies to obtain it? Canada has been supplying an important proportion of the foods required by the Allies. Recently Canda's share in furnishing food stuffs to the Allies has been as follows: Of wheat, 42 per cent.; oats, 38 per cent.; barley, 14 per cent.; rye 4 per cent.; cheese, 67 per cent.; pork products, 9 per cent.; beef, 2¼ per cent.; butter 1½ per cent.

Lord Rhondda, British food controller, sent the following message recently: "The Allied larder is dangerously empty, but we are carrying on in the resolute belief that we can rely on the people of North America to prevent our food supplies becoming so diminished as to imperil the issue for which we are all fighting." The secretary of the British ministry of food says: "Great Britain relies on the United States and Canada for sixty-five per cent. of her essential food stuffs. Unless we get this food, or nearly all of it, we shall peter out."

There is not enough food on our side to let us be free from anxiety and danger of famine this year or next year, even if peace should be won before the winter comes; and if we all produce and eat as much and waste as much as we used to eat and waste, the privation among our Allies will become still greater—privation which is almost certain to mean starvation for women an dchildren and the weakening of our position in the war. That is the gravity of the food situation.

Why did we not know about that sooner? Well, the men at the heart of things have known of it, but the people would not hear or heed because the abundance all about us was so great. I sometimes think, with my body in Ottawa and my mind behind the lines at the front—If they hear not Moses and the Prophets (men of intelligence, vision and responsibility) neither would they be persuaded although one of our soldiers rose from the dead and said, "You folks at home are putting in peril all that I died to save."

Caues of the Food Shortage

The big harvest hid the danger from our eyes. It was such a big rarvest, not only in Canada but in other countries that there was plenty of food. But by the end of 1916 the real food situation began to be understood.

The causes of the world wide shortage are still cumulative. There was a general shortage in the northern hemisphere in 1916 of the five big cereal crops, wheat, corn, rye, barley and oats. Of these crops, 1,968,000,000 bushels less were produced in 1916 than in 1915, or about two and a half times the total quantity of these crops raised annually in Canada. Even in normal peace times this sortage would have been serious, but its seriousness is greatly accentuated by the war. The sortage was due to several causes. One of these was the weather, over which, of course, there was no human control. The chief cause, however, was the withdrawal of labor from farm production. Altogether a conservative estimate would place the total number of men withdrawn from agriculture for fighting and munition making in the allied countries at some 6,000,00. That has resulted in the prevalence of weeds, which it will take many years of vigorous labor to combat and remove. Moreover, the supply of fertilizers has been greatly reduced; and years will pass before the former productiveness can be restored.

The scarcity of food has been aggravated by losses due to the destruction by submarines. For a long time fifty per cent. of the cargo capacity of most ships crossing the Atlantic was reserved for food stuffs. Many of these ships have been sunk, as have also doubtless many others which were loaded solely with food products. Of the food suplies which were still available after these great losses, it cannot be said that they had been husbanded to the best advantage. The temporary prosperity of munition workers, many of whom are receiving higher wages than ever before, has resulted in extravagant buying and living. Taking all these factors into consideration it is no exaggeration to say that the world at present faces a food situation that is nothing short of appaling. Even if peace should be won this year severe privation from shortage of food and the danger of famine in some of the countries of our Allies are sure to continue until after the harvests of 1919 and 1920 are reaped.

The Responsibility Lies on Us

Since the war began the farmers of the Maritime Provinces have risen to the great occasion nobly. Some of the best of them have sealed their devotion by the supreme sacrifice of service unto death in Belgium and France. Those at home have spared sons and

MILL FEEDS FOR 1918

The Maritime Farmer Endeavours to Get Supply--N. B. Dept. of Agriculture Also Takes Action--To be Handled Through Agricultural Societies

The mill feed situation during the last fall and the winter just closed has been entirely unsatisfactory from a Maritime Province standpoint. The supply has been meagre and one of the difficulties has been to procure feeds without taking a large quantity of flour to each car. However, the Food Controller has issued an order to the effect that it will be illegal for any mill to insist upon wheat flour being taken where sales of feed are being made. This important concession has been won by the ceaseless activity of THE MARITIME FARMER. With this order in force it should be much easier to secure straight feeds for next year' delivery but it must not be forgotten that it is one thing to order feeds and another thing to have the transportation companies deliver them. The outlook in this connection, for the late fall of 1918 and the winter of 1919 is far from promising. Agricultural Societies therefore wishing to procure mill feeds should see that orders are placed with THE MARITIME FARMER not later than June 15.

During the past year THE MARITIME FARMER has handled quite a few cars of bran, middlings and cotton seed meal. The bran was supplied at from $36.00 to $37.50 per ton delivered; middlings at $42.50 to $43.75 per ton delivered; and cotton seed meal, 38½% protein from $49.50 to $51.40 per ton delivered. BY COMPARING THESE PRICES WITH THOSE YOU HAVE BEEN PAYING DURING THE PAST YEAR YOU CAN READILY DETERMINE FOR YOURSELF WHETHER OR NOT IT IS IN YOUR INTEREST TO HAVE THE AGRICULTURAL SOCIETIES IN YOUR DISTRICT TAKE UP THE QUESTION OF BUYING FEEDS CO-OPERATIVELY.

In order to insure a larger supply of mill feeds for the season of 1918-1918 THE MARITIME FARMER has sent a representative to Quebec and Ontario to purchase feeds for delivery from August and September on. The prices arranged for these feeds will be wholesale prices and every effort will be made to get straight cars of middlings and bran. However, it is only fair that members of Agricultural Societies procuring straight cars of feed, should buy their flour from the mills which agree to give them preferential treatment. There are mills in Canada who absolutely refuse to sell to farmers. These millers insist that their goods must pass through the hands of the dealers in order that the farmers may be made to pay from $8.00 to $10.0z per ton more for feeds than they have been paying where the supply has been procured co-operatively. We remember that fair play is bonny play and from millers willing to deal with farmers direct, farmers should buy their flour. Apart from the question of fair play there is the additional inducement of getting flour from $1.00 to $1.50 less than when it is brought through the ordinary channels.

Agricultural Societies interested in this movement should hold meetings at once and arrange to have their members order next year's supply so that the total order may be sent to THE MARITIME FARMER not later than June 15th. If you want any further information for your Society write THE MARITIME FARMER, Susex.

In addition to the Maritime Farmer's effort the department of agriculture, Fredericton, at the suggestion of the provincial convention which met Dr. James Robertson in Fredericton last week, has decided to send a representative to interview the millers and purchase all the available feeds for prompt delivery at New Brunswick points. The fertilizer question will also be looked into by the department of agriculture and all available fertilizer will be secured and delivered to N. B. points at the earliest possible moment.

---

brothers for the army until the farms are stripped almost bare of necessary labor. I honor the men and women who have toiled bravely, early and late, to the last ounce of their strength It has been for a great cause. Now, as ever, he that endureth to the end shall be saved. So we must not now slacke nour efforts. The logical sequence to the work that has been done is to follow it by a further effort for still greater production. We should use all the experience we have thus far gained in planning and carrying forward a campaign for larger acreages and higher yields in 1918 and the years that are to follow. We can better meet the needs of the Allies by the production of food than by any other service. The framers of North America are in a better position than those of any other grain producing section of the globe to contribute to the food needs of the armies in Europe. A given tonnage of shipping can carry over twice as much grain from America as from Argentine and three times as much as from Australia or New Zealand. It is vital at this juncture and will continue vital until the end of the war that shipping be employed on the routes where it can be used to greatest advantage. One of the most effective ways to conserve shipping is to provide as large a proportion as possible of the food requirements of the Allies from Canada. Bear this in mind: When a ship is sent to Australia for foods for the Allies it means one less ship on the Atlantic route. In the time consumed to make one trip from Australia, the ship could make three trips across the Atlantic—equtl to one cargo of foods and two cargoes of men and equipment of the new Ameican army.

Single Plants and Single Bites

The personal effort of individuals is the only way whereby the suply of food can be increased. Under modern conditions one cannot expect the earth to receive a miraculous shower of manna; a Niagara of wheat to fill the empty granaries and elevators is not to be expected; food comes from sin gle plants produced by nature in co-operation with the intelligent labor of individuals. It is necessary to be diligent and fervent in conserving what has been produced, in preventing all waste and in shifting our own consumption from flour, beef and bacon which the armies and civilian populations need from us, to other foods which cannot be sent overseas.

A careful computation of the reduction in the consumption of beef, bacon and flour by means of the compulsory regulations of public eating places and voluntary co-operation of the women shows that the amounts saved are sufficient to provide those foods for an army of 500,000 men. The operation of both methods is being continuously improved.

War Production Campaign for 1918

Now the federal and provincial departments of agriculture are leading and directing the farmers towards an immensely increased production in 1918. A war production campaign is in progerss which will reach every farmer from the Atlantic to the Pacific. In the towns vecant lots will become war gardens. Canada recognizes her responsibility in partnership with the United States to answer the prayer of their needy Allies: Give us our daily bread.

The farmers of eastern Canada are called upon, by the grave emergency which our Allies face, to produce in 1918 2,000,000 of acres additional of cereals and cultivated crops. That amounts to about five acres per farm In the plans for increased production which have been agreed upon between the dominion department of agriculture and the Ontario department of agriculture, 1,000,000 additional acres has been accepted as the objective for Ontario. The deartment of agriculture for the province of Quebec believes the farmers of that province will go a good long way beyond their objective of 600,000 additional to the acreage of last year. The farmers of the three maritime provinces are depended upon to provide 400,000 additional acres of cereals and other cultivated crops. New Brunswick has set 150,000 additional acres as her objective for this year.

Outilne of Plans in New Brunswick

In the plans which have now been ageed upon between the dominion minister of agriculture and the Canada Food Board, on the one hand, and the province of New Brunswick, provision is made for the work of one or more greater production committees of farmers in every municipality. It is proposed that every farmer will be visited personally by a member of one of the greater production committees. The objec is to help him to understand the gravity of the situation and to enlist his earnest determination to do his best notwithstanding the greater difficulties he has to overcome and also because of the greater difficulties

Every Investor Should Send for This Book

EVERY Victory Bond Owner—every Investor, large or small, anyone who is interested in the investment of money in securities, should send for this book. It is being distributed free of charge by the Montreal Stock Exchange for the purpose of assisting and protecting the public in the investment of their savings.

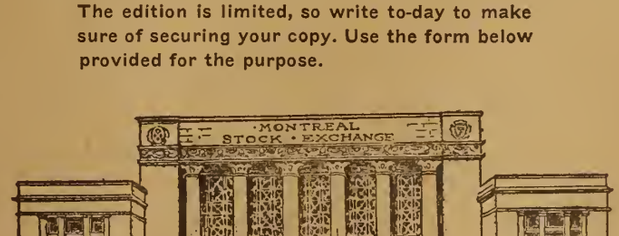
This book clearly defines the different classes of securities and shows how the payment of principal and interest is secured. It shows the broadness of the market and why securities can be converted into cash when required. It tells of the methods and advantages of listing securities; explains the functions of speculation, pointing out its value and its abuses.

It describes the functions of the Montreal Stock Exchange, the facilities it offers, and the service rendered to th public by its members.

It details the methods of how business is done between client and broker.

It is a book of inestimable value to every investor—to anyone who is desirous of investing savings, either large or small amounts, in securities.

The edition is limited, so write to-day to make sure of securing your copy. Use the form below provided for the purpose.



MONTREAL STOCK EXCHANGE

To The Secretary, Montreal Stock Exchange, Room 528, Stock Exchange Building, Montreal.
Please send me, without obligation, your booklet on "Investing."

May 7-28
June 11-25

THE MARITIME FARMER HAD THE CALL

At the recent meeting of the Farmers and Dairymen's Association it was suggested that the agricultural societies of New Brunswick should have an official organ. The idea thrown out was that it would not only be well for every member of the agricultural societies to read a farm paper, but that that paper should be one in which all matters pertaining to agriculture might be published with a reasonable hope that members of agricultural societies would note them. No paper was suggested as meeting these requirements. However, when members of the Farmers and Dairyman's Association were called upon to name a paper the unanimous selection fell to the MARITIME FARMER. During the past year the Maritime Farmer, acting as the purchasing agent for a few agricultural societies managed to save thousands of dollars for them by delivering mill feeds, flour and cotton seed meal at cost. The Maritime Farmer has other things in view that will materially assist members of agricultural societies. We would like to have active secretaries of agricultural societies throughout the province send us from time to time, condensed reports of their activities in the sections they particularly serve. By doing this, one society will be able to suggest something of value to many sister organizations. In that way a great work can be accomplished in this province in stimulating an interest in agriculture and improved farm conditions. The Maritime Farmer is cheerfully placed at the disposal of any agricultural society secretary who cares to tell his confreres just what his society has accomplished for its members. Sometime when you are not busy, Mr. Secretary, drop us a line and we will be glad to publish it for you.

FERTILIZERS SCARCE—A LESSON

A year ago Agricultural Societies in New Brunswick were warned that it would be well to place orders for fertilizers previous to September, 1917, if they were desirous of having their orders filled for use in the spring of 1918. The wisdom of that warning is now patent. Chemical fertilizers are particularly scarce. Not only have some of the American wholesalers practically withdrawn from the New Brunswick field, but the United States Government has refused to permit the exportation of chemicals, and added to this is the very serious shortage in cars and the difficulties the railways are encountering in operating their systems due to the unusual severity of the past winter. No doubt 1918 seemed most remote in April, 1917. Wise farmers have long since had their chemicals in store. The foolish virgins are without fertilizers and at this time without any well founded hope of securing a supply. The lesson to be learned from this experience is that all Agricultural Societies in the province should at once make preparation for a supply of fertilizer in 1918. Meetings should be held at once and arrangements made to order fertilizer for delivery in the fall before the railways are again tied up. The situation promises to be even worse next year.

In the first place, it will be necessary to arrange with the United States government to allow the supply to cross the border. In the next place, the labor problem in the United States next year will be acute and there will be difficulties in handling the freights. The United States railways will be taxed to the utmost to look after their own war business. Taking all these things into consideration, an early effort should be made to get together and look after next years requirements.

The N. B. Agricultural Societies United is prepared to supply agricultural societies belonging to the organization with fertilizers at cost. All interested should write the secretary of the association, Mr. J. D. McKenna, Sussex, N. B.

THE BEST CONVENTION YET.

The annual meeting of the N. B. Farmers and Dairymen's Association for 1918, was in many ways the best convention that body has ever held. There was a disposition to get away from the cut and dried programe of previous years and the farmers themselves were more disposed to "talk things over." There was also manifested a desire to greater united effort on the part of the farmers of New Brunswick. The last few years have done much to demonstrate to farmers the desirability for united action. Present conditions, and the probable outlook after the war would suggest that "desirability" has become "need." There is no doubt that when conditions begin to adjust themselves at the conclusion of peace, the farmers of this country will find it one of the essentials in connection with their profession that they become as one in deciding matters of common interest to agriculturists. The organization of the farmer's forces in the West has been widespread and complete. In the Maritime Provinces we have not made such marked progress, but the idea of union is gaining strength and the next few years should see a wonderful change in the viewpoint of farmers towards their new interests.

EXTENDED ITS USEFULNESS

The Agricultural Societies United at a recent meeting of the directors, decided to ask the Provincial Government to extend the scope of its usefulness so that it might handle in a wholesale way, for the Agricultural Societies of the Province, many articles which are consumed by the farmers. So far the organization has only sold fertilizers, but if the necessary authority is given other important lines will be added to the list of commodities dealt in by the N. B. Agricultural Societies United. The organization has also requested the Department of Agriculture to appoint a field man who will instruct the farmers of New Brunswick in the use of unmixed chemicals. It is proposed to thoroughly organize the province of New Brunswick and to bring into being, an organization which will exercise very considerable influence among the farmers of this province. The step is decidedly one in advance of anything heretofore attempted, and the experience already gained shows that which may be accomplished in supplying farmers with materials at cost and thus effect a saving, amounting to thousands of dollars per year. Every agricultural society in the province should be a member of the N. B. Agricultural Societies United. The annual fee of which is fixed at $5.00 per annum by Order-in-Council, entitles any agricultural society to all the advantages of the organization. With an extended charter, the Agricultural Societies United will be able to give the farmers of the province a better and more valuable service.

A TIP FOR THE DAIRYMAN WITH MODERATE MEANS

The dairyman of modest means who desires to "grow into" the pure-bred business can do nothing better than give earnest consideration to the old cow. Check up the number of dairymen among your acquaintances who have been successful with registered cattle. You will find that a surprising number of them either began with or own a large part of their success to one old cow—a good one in each case, of course.

Unless a man has considerable money to spend he has to begin with a very few animals. Very often there is only the purebred herd sire and one female. When his hopes are pinned to but one animal, the dairyman very naturally takes many pains to get a good one. It is of much importance that he should do so, for he is selecting foundation stock which in time will influence a large part of his herd and perhaps determine his success or failure in handling purebred stock.

There are a number of reasons why an old cow is a safer purchase for foundation purposes than a young one. In the first place there are fewer chances for her to be a gold brick. She has age, so when the buyed obtains her he may not only know her records of production and the performance of her descendants, but also how well she has stood up under the strain of heavy production. From the appearance of a young animal the strength of constitution it will exhibit in later years can hardly be foretold with any greater degree of accuracy than its future productive ability, while in the case of the old cow there need be no guesswork about this matter.

In the important matter of price the old cow again has the advantage of the argument. As a producer of milk and butterfat she may have seen better days, so her owner is willing to let her go for less than a young animal with her main producing years still ahead of her. While the beginner in the purebred business wants a foundation cow of reasonable productiveness, his primary interest lies in her ability to transmit to her offspring the productive ability that she has formerly exhibited. So far as breeding qualities are concerned, the old cow is fully the equal of her younger sister. The younger cow may present her owner with more offspring during her years, it is true, but here enters a larger element of uncertainty regarding their quality. Everything considered, it is found that the dairyman with only a small amount of money to spend can obtain greater value in purchasing the old cow for foundation stock, with less risk in the investment, than in buying the younger but unproven animal.

THE NEW BRUNSWICK FARMERS AND DAIRYMEN IN ANNAL SESSION

(Continued from page 375)

Whereas the Dominion Government is urging upon the farmers the necessity of greality increasing the production of pork for the purpose of feeding our men at the font and our allies, and have declared that it is one of the great factors in winning the war,

And whereas owing to the high price of feed and labor the cost of production has become correspondingly high.

And whereas in former years when increased production was achieved, prices have always fallen, farmers are deterred from increasing their output unless they are assured of a stable market at prices which will allow them a reasonable profit.

Therefore resolved that the Farmers and Dairymen's Association request the Government to guarantee that the price received by the farmer for pork for the next two years shall not be less than 20 cents per pound, thus inducing increased production and giving farmers guarantees similar to those manufacturing munitions.

Further resolved that this resolution be sent to the Hon. Mr. Crerar and Hon. Mr. Tweeddale.

* * *

Whereas, a big majority of the children attending the public schools of this province are sons and daughters of farmers,

And whereas, the instruction being given in said schools is very largely of an abstract character and tends to make said children favor professional occupations, which further tends to increase the population of the towns and cities,

And whereas, if the curriculum of said public schools of this province were to contain some more concrete form of education regarding agricultural matters it would tend to increase the desires of said children toward agricultural pursuits and also to increase the population of the farms.

Therefore resolved that the Farmers and Dairymen's Association of New Brunswick is of the opinion that a largs measure of instruction in said public schools about local conditions and activities in the country relative to agricultural pursuits is desirable, and that the efforts of the pupils, particularly in rural diistricts should be directed in a greater degree by the teacher through practical methods of training so as as to cause the children to acquire a clearer, stronger and more intelligent interest in the greatest of all industriees in the province.

Further resolevd that a copy of this resolution be presented to the Board of Education.

Moved by H. H. Magee.
Seconded by James Porter.

* * *

Whereas, the present law in regard to bulls running at large is left to the will of the County Councillors and is not being enforced,

Therefore resolved that in the best interests of the farmers of the province, the Provincial Government be asked to pass at this session of the Legislature, a law prohibiting the running at large of bulls in the public highways, in any part of the Province of New Brunswick.

Further resolved, that provision be made for the strict enforcement of this law, by fines and penalties as the Government may direct.

Submitted by Agricultural Society No. 122, Newcastle. H. Williston, President, G. G. Stothart, Secretary.
Seconded by John McColum.

* * *

Resolved, that in deference to the large number of French speaking farmers in the Province of New Brunswick and to the large representation of the said class attending this convention, we respectfully ask that at least one session of the future conventions of the Farmer's and Dairymen's Association be addressed by French speakers.

W. O. G. DOUCETT,
G. J. DOUCETT,
T. J. DOUCETT,
J. E. DeGRACE,
J. A. BURNIER.

* * *

Whereas every available pound of flour is needed to sustain the fighting forces at the front,

And whereas the millers of the Dominion are forcing flour on the people by refusing to sell feed without a quantity of flour in each car, regardless of the fact whether it is needed or not,

And whereas this Association of the Farmers and Dairymen of the Province of New Brunswick believe such actions to be pro-German.

Therefore resolved that it be demanded of the Food Controller that legislation be passsed to force the millers to abandon such destructive procedures.

Moved by R. E. Floyd.
Seconded by Frank C. Fawcett.

* * *

The Finance Committee reported a balance of upwards of $125.00 after they had examined the Treasurer's books and vouchers.

On Thursday afternoon the delegates were taken by special train to the Experimental Farm where they inspected the various departments and listened to an address on live stock by Prof. J. M. Mitchell. Mr. Hubbard the Superintendent of the Farm, always gives the farmers a hearty welcome and plans to give them a profitable outing whenever they visit the farm.

J. H. Grisdale, Director of Dominion Experimental Farms and W. W. Hubbard addressed the audiences on Thursday evening on labor saving plans and farm machinery. Prof. Grisdale's suggestions included: Make better use of brain power to combine knowledge and energy for best results. Plan the fields. Have seed ready early. Have implements and harness in good repair. Have the horses and a sufficient number of them in good fit for spring work. Use three and four horse teams if possible. Treat seed for smut. Look well to the drainage of fields. Start work at the first opportunity. Use big efficient machinery. Plan for large fields instead of small patches. Increase effectiveness of man power and horse power by proper planning.

Officers for Ensuing Year

The election of officers on Friday morning resulted as follows:—

President—L. M. Anderson, Sackville.

Vice-President—J. A. Bernier, Edmundston.

Recording Secretary—C. M. Shaw, Hartland.

Corresponding Secretary — A. R. Wetmore, Clifton.

Treasurer—H. H. Smith, Hoyt Station.

County Vice-Presidents

Albert — Albert Mitton, Hopewell Hill.

Carleton—Scott A. Shaw, Hartland.

Charlotte—Stanley Wilson, Rolling Dam.

Gloucester—W. S. D. Doucett, Beresfor.

Kent—Simon Barstarachi, Buctouche

Kings—H. H. Sherwood, Upham.

Madawaska—Elias Doyle, St. Hilain.

Northumberland—W. M. Johnson, Chatham Head.

Quenes—Fred N. Fowler, Chipman.

Restigouche—J. E. Cooke, River Charlo.

St. John—J. M. Donovan, St. John.

Sunbury—M. A. Smith, Hoyt Station

Victoria—Hans P. Hanson, Peterson.

Westmorland—S. Melanson, Memramcook.

York—John Inch, Burtts' Corner.

A discussion on Agricultural Societies was led by M. A. MacLeod, Supt. of Agricultural Societies of the Province, who also read the following extract from a letter just received by Mr. McKenna of the Maritime Farmer, from the Food Controller:—

"As soon as I receive the full data in answer to the charge will lay same before you.

"We have notified the mills that unless this practice of endeavoring to force out the sale of flour with cattle feed is stopped that we will cancel the license of the miller and prevent him operating unless he desists from such practice.

"In addition to individual cases have written the secretary of the Millers Committee, pointing out that they had better use their influence to stop this practice and so save cancellation of licenses. The committee in session today have pledged themselves to do their best to stop same in the future.

"The above is mentioned to you so that you may realize that your effort on behalf of the farmers has brought forth fruit.

"Unfortunately there seems to have been a misunderstanding arisen out of our correspondence. The writer is very anxious that such shall not exist, and if there is anything that I can do to remove same or to further the good work in which I understand you are very active, it will be a great pleasure for me to do so, and I will be glad to hear from you respecting same."

Yours very truly,
CANADA FOOD BOARD,
per Frank H. Keefer,
Counsel and General Adviser.

After the reading of the letter in question the Association passed the following resolution which was ordered to be forwarded to the Food Controller with the resolution already referred to so that he may see the attitude of the farmers of New Brunswick before and after they were guaranteed a fair show re feed supplies.

* * *

Whereas a letter has been received and read publicly, stating that a definite action has been taken by the Food Controller favorable to the feed question respective of the farmers' request

Therefore resolved that we commend the action of the Food Controller in this matter and that a copy of this resolution be forwarded to said Food Controller together with a copy of the resolution passed at a previous session in which his non action was roundly condemned, so that he may know the attitude of the farmers of New Brunswick on the feed question.

On Friday afternoon the delegates visited the Provincial and York County Seed Fairs in the gymnasium of the Normal School, after which the largest convention in history of the Association disbanded for another year.

PRESIDENT BAIRD'S ADDRESS BEFORE THE N. B. F. & D. A.

Fellow Members and Officers of the Farmers' and Dairymen's Association:

On this the 42nd Annual Meeting of our Association, it is my privilege and plesant duty to extend to you a word of welcome. I hope you may find the meetings helpful and inspiring and that you will carry home with you pleasant memories of these days spent in the city of Fredericton. I hope that you may not only enjoy the meetings but that you may profit by them and get a vision of the possibilities of agriculture in New Brunswick.

We are met in convention to deal with matters of vital importance—not only to ourselves but to every man, woman and child within the bounds of our Province. This is a statement that would have been questioned, perhaps laughed at had it been made a few years ago, but I think you are all ready to accept it now. Every eye is directed to the tiller of the soil as the main hope for the present and the years to come. Big things are expected of us. Shall we "measure up?" This is the time of our testing, it is also the time of our opportunity. The hopes of the fathers of this Association, thirty or forty years ago, as to the development of Agriculture in this province have not yet been realized. They did their part. They laid foundations. They cleared land and built roads. They had faith in God and in the farm. They planned for their sons to settle on the land. But another generation arose. The very economy and thrift of the "old folks" often placed the son where he viewed farm life as too slow and tame for him. Black foxes or building lots out west —in some cases small—used up the money received for the Old Homstead. Perhaps this was the exception rather than the rule but we must face the fact that the general trend has been away from the country and the farm to the town.

I believe this applies more strictly to the English speaking people than the French, yet on the whole, in the Province of New Brunswick the last census shows that during the ten preceding years the rural population decreased by 22,262. Perhaps this has something to do with the claim put forward in the Canada year book just published, "That there is more big game to the square mile in New Brunswick at the present time than in any other part of North America."

Why do we speak of these things at the opening of this convention? They are not pleasant—they are not encouraging—but they are true, and they indicate that there has been something wrong in the attitude of the people of New Brunswick in regard to the farming industry, during the present generation.

If a wrong, it is to be righted; it must be faced. We must be convinced that the wrong exists. It seems to have taken several years of war and a Military Service Act to arouse some to the fact tha tthey ought to be farming. Many of us who meet here from year to year have deplored very much the tendency of the young man to avoid settling on a farm in N. B. Personally I may say that 20 years ago I would hardly have said N. B., but my own experience and observation during these years have convinced me that there is no better Province in the Dominion than our own Province of New Brunswick. This is especially true for the young man with small means wanting to start a new home. I have studied closely for a number of years a publication issued by the Department at Ottawa, giving monthly a statement on crops, yields per acre and farm conditions generally in all of the different provinces and I find that N. B. does not suffer by comparison. Our Province is just coming to its own in the way of popular recognition of its resources and advantages. We used to think if we wanted to grow apples we must go to Nova Scotia. I think we are convinced now that if we wean apples all we have to do is to plant apple trees—and take care of them. What has been accomplished during the last few years in apple growing ought to be an inspiration to us in regard to other unused natural advantages right at our doors. Those who have surveyed the Province and studied conditions in reference to the sheep industry, report opportunities for development along that line almost unequalled anywhere.

We have spent considerable time at our meetings for the last few years, dealing with the dog. He isn't dead yet, but he's regulated and we now have time at these meetings to talk sheep and more sheep.

We spoke of this being a testing tiime for us. Is that true? Reference has been made in our meetings of recent ears to the war cloud that was hanging over us and hopes have been expressed, and praeyrs offered that before we should meet again that cloud would have vanished—but instead, I think we may say, the storm is on. A cry comes to us from over the sea for help. It comes through the church and thes ecular press, from relief committees in those stricken lands, from the British Government and our own Government. Money is needed—food is needed. We can no longer sit

(Continued on page 398)

HORTICULTURE

NEW POISON SPRAYS AND NEW VARIETIES OF FRUIT FOR THE FARM ORCHARD

The Ontario Fruit Growers. Assoia tion at its annual convention recently in Toronto, discussed the problems that affect the present state of the fruit industry. and the propects of the coming seasou. The apple crop, according to the report of the President, Mr. F. A. Sheppard, was almost a failure in 1917, and finer fruits from peaches to berries, were in no case over half a crop. and in some districts not over 15 per cent. crop.

One of the great handicaps that fruit growers are to experience this season is the high price of poison sprays.

Prof. Caesar said that arsenate of lead. in 100-pound drums, is likely to cost 20c. to 25c. per pound in paste form, or 40c. to 48c. in powder. This is about three times the price ruling before the war.

A New Spray

Arsenate of lime, or. as it is sometimes called. calcium arsenate, is only 15c to 18c in paste form, and 30c to 35c in powder. The arenate of ilme, Prof. Caesar said. has given good control with biting insects, and is more convenient to use with lime or sulphur than arsenate of lead; but, used with water alone, it will severely burn foil age, while arsenate of lead will not. Prof. Caesar destroyed almost every leaf on a pear tree in this way.

As the condling moth will probably not be very bad this year. Prof. Caesar thougth it might do, in using arsenate of lead, to use 1½ lbs. paste or ¾ lb. powder to 40 gallons in spraying apples and pears for moths. If only one spray is given this year the most important is the one just after blossoms fall; the next in importance is just before bloom.

Regarding dust spray, Prof. Caesar said he had secured good results from this. and good results had also been reported from Nova Scotia, New York and Michigan. In an ordinary year in well pruned orchards this will give good results generally if well applied but under conditions favorable to scab it is not equal to liquid spray.

New Varieties of Fruit

Prof. W. T. Macoun. Experimetal Farm, Ottawa, in giving a resume of his work. in growing and testing new varieties of fruit said, Red June a new early apple tested by him is a good shipper, and Stayman Wine Sap. a "sport" of the original Winesap, is a larger and better than the original apple of that name. Melba and Joyce seedlings of the McIntosh come in August and September respectively and are both good apples. Omaha and Emerald. new plums, created by hybridizing Burbank and Wolfe, are both excellent. The first named, a red plum. comes in August and the latter a red and yellow. in September. Portia and Oleria are two promising new varieties in strawberries.

Potato Crop and Small Orchards

A number of the smaller orchards are being neglected, and this, Mr. D. Johnson. Dominion Fruit Commissioner. said was one reason why he predicted that the coming apple crop would not be a large one. At the same time, he said, he believed well cared-for orchards will give profitable returns this season. because of special efforts being made to educate consumers to the use of fruit and vegetables rather than other lines of food.

Dealing with potaotoes. Mr. Johnson and there was an estimated surplus of 2,000,000 bushels in Prince Edward Island alone. but. owing to the breakdown in transportation, much of this surplus will probably be fed to stock. The surplus in iNew Brunswick. he added. has been largely absorbed in meeting the demand from New York and Boston.

Failure Crop and Low Prices

Past President Dr. A. J. Grant of Thedford said he believed the failure of last year's apple crop was largely owing to trees having been robbed of vigor by scab infection of the leaves in 1916 As a result of neglect in 1916, and previous years, he believed many small orchards would disappear.

An other grower. referring to fruit gfrowing in the Maritime Provinces. said that after three years poor crops of apples the prospect is for a fairly largs crop this year, with low prices. He expressed regret because of the high prices asked for Nova Scotia apples last fall had resulted in considerable quantities of these being still on hand.

Girls on Fruit Farms

Dr. Riddel, Superintendent of the Trades and Labor Board. outlined the good work done by girls on the fruit farms of Ontario last year. They had taken up the work largely on patriotic grounds. but they could not be expected to subsist on this, and he was sure there would be some settlement of the wages problem. He stated that 54 per cent. of the girls earned four to seven dolars per week last year, and had to provide for their own board. He thought the farmers might help in the matter of camps so as to reduce expenses in this direction.

In the course of the discussion which followed Dr. Riddle's address, some of the farmers present declared that it would be impossible to increase the wages of girls this year as it would dislocate the whole of the farm market as everybody would be demanding increases.

Farmers from London. Clarkson. Newcastle an dother disrticts spoke very favorably of the work done by the girls, and stated that the had secured good profits from their help in gathering in the fruit crop.

Pickers and Packers Scarce

With regard to the peach crop outlook. Mr. Hamilton, Grimsby. said that the showing of buds was good, but the organization of the industry was poor and the transportation outlook was bad. He recommended the more extensive use of motor trucks and that the Provincial Government should take over the trunk roads. He looked to the women of Canada to help in the problem of picking and packing. There was not enough care. he states, in the packing of the fruit. He deprecated any suggestion of reciprocity with the United States, and claimed that such a step would ruin the peach industry of Ontario. The prospects in other fruits were said to be reasonably good.

Warm appreciation was expressed for the help that has been given from the school pupils, but it was pointed out that the month of September was more important to the farmer in this regard than the month of August, and a resolution was carried asking the Board of Education to allow the pupils to remain out of school until October.

Appreciation was expressed. also, for the help received by the farmers from the Department of Agriculture.

A FRUIT ACRE ON EVERY FARM MOST VALUABLE

Whatever comparison may be made in connection with the relative positions of the farmer and his city cousin along most lines of living. privileges. and oportunities, there is one thing, at least. in which the farmer has a decided advantage; and that is the possibilities of supplying the home with the luxury of a bountiful store of neecssary. wholesome and luscious home grown fruit; necessary. because it is almost, if not quite impossible, to maintain perfect health, particularly in the case of children, without the natural. corrective. and laxative qualities of nature's best medicine and antidote to many indiscretions of modern living; wholesome because in addition to its other good qualities, fruit furnishes an important and one of the most easily digested articles that can be supplied to the daily ration; luscious, because of its juicy substance and palatability. There re very few peopel of any age who do not now and again enjoy a good apple. peach or pear. and the child who refuses good fruit must either have been deprived of it in his earlier days or be too ill to enjoy anything at all.

Any man who owns a farm and has lived on it for three or four years and

RENNIE'S War Time Production Seeds

THERE must be no "slackers" this year, either among the seeds or the growers. Every man and woman with garden space, must produce to the limit of his or her ability. And that is why Rennie's seeds are so essential—live, vigorous seeds from tested stock, to ensure record crops.

"It is Such a Saving in Labor I Must Have a Power Outfit."

In his sixth order to us, Mr. J. C. Harris, of Ingersoll, Ont., says more for the Spramotor than our most enthusiastic advertisement. A man may buy a thing once and be dissatisfied, but when he comes back for additional purchases, there is only one conclusion to come to, and that is, that article must be all right. We never claim more for the SPRAMOTOR than that it would do the work required of it effectively and economically, and in all things give satisfaction. And letters which we have received and are constantly receiving from farmers all over Canada, signify that our statements have been met with a service that is making staunch friends for the Spramotor wherever it is used. Over 100 Gold Medals and Special Awards to the credit of the Spramotor shows that these expressions of confidence are merited. Suppose you write now while the matter is fresh in your mind, for a copy of our booklet on crop diseases.

is still without an abundance of most kinds of fruit that will grow and mature in his locality, has neglected to take advantage of one of his greatest opportunities and advantages.

The one particularly good thing about providing for a bounteous supply if fruit is the fact that, on the farm, the expense outside of a little labor, which can be given now and then, so not to seriously interfere with the regular farm work, is comparatively trifling. An acre of land properly laid out, planted and cared for will supply an ordinary family with all the fruit they can use from the time the first big luscious strawberries come until the frost compels the last big red Northern Spy or McIntosh to seek shelter in the cool clean cellar, where, almost until the strawberries come again, they may be enjoyed by young and old, fresh from the box or barrel; or, if the need arises, from the fruit jar or the evaporator box.

Lay Plans Now

Now is the time to plan for the fruit graden. Select a plot of good land and manure it well during the winter. If it has been fall-plowed, so much the better; if not, plow as early as possible in the spring and thoroughly work down into a fine mulch. If the ground has not been underdrained, it should be done at once, or at least as soon as possible in the spring, unless the soil drains out naturally. One cannot have a satisfatory orchard on wet land. The farmer frequently needs to get on to this land very early in the spring which cannot be done unless it is thoroughly drained. And then again much damage will be done to young trees, shrubs and plants by frost heaving them out of the ground if good drainage is neglected.

Plant all young fruit trees and plants as early in the spring as the ground is fit; but on no account work or tramp over the soil when it is wet. Fall planting is done in some cases, but it is usually not nearly so satisfactory as the spring, or unless conditions are very favorable many losses will be sustained.

In selecting trees and bushes for planting be sure and get them from a reliable nursery. This is very important both on account of the vitality of the tree as well as having it true to name. One should accept no substitutes. When a list has been made out carefully from varieties that promise to do exceptionally well in a certain locality a substitution that is claimed to be "just as good or better" should ont be permitted, as the results will most likely be disappointing. If an order is signed with an agent of any company, be sure that the words "No substitutiin allowed" appear on it, or otherwise you may find that there is a clause in the contract which grants the company that privilege. Be sure to read over the order in your own hands, before signing any contract. The nubmer and age of each variety shiuld be specified.

In apples, pears, cherries, peaches and plums two year old trees are usually the best. Agents often try to sell older trees at a higher price, but they are really not as good as the younger trees.

In planting, all broken or bruised limbs and roots should be cut off and the top trimmed back to form a well balanced head. Planting is a most imoprtant part of forming an orchard or fruit garden. The hole should be dug large enough and deep enough to allow all roots to be spread out in a natural position so that fine, fresh and moist soill may be used to cover them. The size may be 18 inche to 24 inches square and the depth be greater than needed for the tree, by several inches, which may then be filled up with loose earth according to the requirements of the plant, thus leaving a favorable condition of soil all round for the new root growth. Lumps of earth, grass, manure and rubbish of any kind should not come in contact with the roots as these will sooner or later cause an air pocket and tend to dry out the mass. After the tree has been put in uosition and the roots properly trimmed and spread, a shovelful of fine, moist but not wet earth should bc thrown on top and the tree raised up and down rapidly a few times to work the dirt around the roots. This should be repeated until the dirt is an inch or two above the roots, when it should be tramped down firm to within an inch or two of the surface and then filled up with loose dirt an inch or two above the level of the ground, over which a covering of coarse horse manure should be put to keep the moisture from evaporating. Cultivation of the soil should be continued all summer for several years in order to favor moisture. Some other cultivated crop may be grown in the same ground also for three or four years but should not come too closely in contact with the trees or bushes, all of which should be kept in straight rows so that cultivation may be accomplished as casily as possible.

In selecting varieties for one's own family use, the process is quite different from that of planting for commercial purposes. In the latter case it is considered best to have only two or three standard varieties, at the most; but for private use a large variety may well be chosen, particularly for the purpose of prolonging the season in any line where there is an opportunity to do so. This can easily be accomplished in most fruit that is grown on trees such as apples, peaches, plums, cherries, etc, and to some extent in other fruits, such as strawberries, raspberries, gooseberries, blackberries, etc., but owing to the sort season of the latter classes the difference between early and late varieties is not so marked.

Inasmuch as the climate of different careful to ascertain if they are hardy sections on Ontario varies greatly, no list can be given that will be applicable to all, consequently any person planting out new varieties should be in their particular locality.

Doubling Crops is Doubling Dollars

Doubling crops is more than doubling dollars, it is often trebling dollars and the soil is permanently improved every time you put fertilizer on it. Fertilizers are inexpensive compared with the results. Crops have advanced in price more than Fertilizers have. A Bushel of Corn will buy 50 per cent more Fertilizer now than before the war. You certainly will never increase crop production until you use fertilizer. There is serious shortage of farm products, so *order your Fertilizer now* for this year, when your effort to increase crops is so much needed. Explain your soil to us and state what crops you want to put in and we will advise you what kind of fertilizer and how much you need. Special rates to farmers who club together and order in car lots. Recommend a good reliable agent for us in your district, if you can.

DAIRYIN.G

INFECTIOUS OR CONTAGIOUS ABORTION IN DAIRY CATTLE

In some sections of the country this common and dread disease is responsible for infinitely greater dairy losses than the more discussed and probably better known plague, bovine tuberculosis.

I can think of but two features of this malady that might, in a negative sense, be classed as redeeming: (1) the bacillus or germ from which infection originates is easily destroyed in a 2 per cent. or 3 per cent. solution of any good antiseptic; while (2) animals having aborted two three years in succession seem to become immune and seldom fail (provided by the time they can be induced to conceive at all) to carry their calves full time. Eventually, therefore, the disease wears itself out, or if young stock are raised, is confined largely to them.

Abortion, or premature birth, or "slinking," to use the popular term, may be accounted for in either of two ways—regarded as an accident or an affliction. It may result because of a run down and consequently weakened condition caused by starvation, exposure, suffering, etc.—a slip, a fall or a bodily injury, in any of which instances it could rightly be classed as accidental. However, only a very small per centage of cases come under this heading, by far the greater number being the direct result of infection with the organism known as the bacillus abortus" or the germ of abortion. This is infectious or contagious abortion—an inflammatory condition of the mucou membranes of the uterus and the encosed foetus, occasioned by the presence of active bacilli abortus. It is undoubtedly an infliction, and a sore one.

The germ of abortion, now definitely known and easily recognized is a microscopic, hairlike or rodshaped organism, which is remarkably virulent or active, and for that reason unusually infectious, as under favorable conditions it will remain active for many months. It may be spread from one animal to another by means of the genital organs, (believed to be the most common manner of infection) and through the medium of uterine discharges from infected females. And again by means of the alimentary canal, by the introduction of the germ through the nose or mouth following its exposure in rectal or urinary excretions; and also by means of food or water or their containers, which have become contaminated.

The germ often finds lodgment in the udder and is implanted in calves through milk taken directly from the teats or through infected milk which has not been pasteurized. In such cases of impantation abortion is likely to occur during the fourth or fifth month following the heifer's service.

Various experiments with prepared cultures of the active germ tend to confirm these theories and illustrate the extremely infectious and dangerous nature of the disease. Pregnant cows known to be free from it have been innoculated with the living germ, injected subcutaneously directly into the circulatory system; and also by the introduction of the active organism into the digestive tract by way of the mouth with the result that they lost their calves, active abortion having been produced.

Theoretically the disease is not so very hard to combat and its complete elimination from the infected herd not particularly difficult of accomplishment. Patience and faithful perserverance are about all that is required. As is often the case, howeveh, in practice it somehow does not seem to work out that way, and its eradication by the average dairy farmer appears fraught with untold difficulties, ultimate success being achieved only after a protracted and uncertain struggle of dubious outcome, often ending in failure and discouragement.

Several reasons may be advanced in possible explanation including: (1) A very general lack of proper knowledge concerning the ramifications of the disease. (2) Disinclination, because of lack of help or ambition, to go to all the trouble incident to a war against the contagion, waged to a successful conclusion. (3) Incredulity, carlessness or irregularity in carrying out and faithfully following up the prescribed system of treatment. (4) A false sense of security engendered in the mind of the busy dairy farmer after a lapse of time in which no new cases develop, and a consequent discontinuation of either active or preventive treatment resulting in a fresh outbreak.

Contagious abortion may be handled by means of one, two or three methods, or better still, all three may be employed. The germ may be attacked: (1) directly through the circulatory system by means of hypodermic injections; (2) locally by giving at regular intervals douches with a proper antiseptic solution introduced into the vagina and uterus by means of a funnel and length of rubber tubing; and (3) by the liberal and constant nse of an approved disinfectant, sprayed upon all utensils, floors, stanchions, stalls, bedding, litter and the head and hind parts of the animals themselves. A cow that has alredy aborted should be put by herself and irrigated regularly twice daily until all signs of discharge have disappeared; and after that once every two or three days until she comes in heat. Do not breed her, but continue the antiseptic douches every three days for seven times, or until a period of twenty-one days has elapsed. The idea is that when in heat the neck of of a uterus dilates and the passage is open, so by flushing the parts at that time the antiseptic solution is introduced directly into that organ. The germ is able to pass the mucus stopper at the neck of the uterus—hence the necessity of frequent subsequent douches to prevent reinfection. If the animal appears normal and comes in heat at the expiration of the twenty-one-day period, it is well to breed her—abortion and sterility go hand in hand together. Care should be taken to carefully flush the sheath of the bull with the same solution used for the cows, before, and immediately after, service.

The pure carbolic acid treatment either by means of a two or three dram 3 per cent. solution hypodermically injected, or a teaspoonful mixed with water and stirred into the dry feed, goes very well with the above local treatment. It is best to secure the ervices of a qualified veterinarian and have him lay out an exact course of procedure, and advise as to the nature and strength of all injections and solutions. The Vermont experimental station has made exhaustive experiments with Methylene Blue in the treatment of abortion—the figures facts and conclusions are embodied in a bulletin which is free to anone who will write for it. The treatment seems to be quite generally successful, the drawbacks to its popullarity being the rather heavy expense, and the fact that after being dosed, everything with which the cow comes in contact, manager, water bucket, stanchions, gutters, etc., including herself, becomes colored a bright blue; while her milk will be found to have acquired a decidedly bluish tinge.

Cows that have not aborted should be kept by themselves and as far apart from the affected animals as possible. They should always be sprayed externally, front and rear, at least once a day, and washed out internally every two or three days. Heifers calving for the first time seem to abort at an earlier stage of pregnancy than do older cows, the latter generally losing their calves during the sixth, and more often the seventh month. So long as the discharge from the vagina remains clear an healthy and the clot attached to the lower point of the vulva continues in place, there is not much danger rof impending trouble. When, however, the little clot disappears, the discharge becomes more plentiful and of a dirty or bloody color, the vulva swells, and on the inside presents a blood-shot appearance, (the minute blood vessels having becoome congested) and finally when the milk flow slacks off (in the case of milch cows), and becomes useless, and the udder swells as when a cow is "making bag," then look out, for you may be certan that within a few days that cow will lose her calf.

After abortion has occurred, every care should be taken to disinfect thoroughly; the bedding and litter, also the foetus, should be burned at once, and later discharges looked after and treated similarly. Once contagious abortion has gained a foothold and become firmly established in a herd, it is of course a long and weary job to completely eradicate it. The resulting losses will be great, not only through the destruction of calves, but also because of impaired milk flow, and still further because animals having aborted often become barren and so create another source of loss. Every precaution should be taken to keep free from the disease a clean herd. It is far better to use good bulls and raise their heifer calves than to buy from outside herds—however, if strange animals must be purchased, they should be regarded as suspicious and kept entirely by themselves until they have proved to the contrary; for in dealing with this disease an ounee of prevention is certainly wroth several pounds of cure.

The unfortunate breeder who happens to sell an animal that later on reacts to a tuberculin test, even though the animal may harbor only a

remote tubercular lesion which may never develop actively and cause that animal to become a "spreader" comes in for severe comendation. But what of the one who sells an aborter? The latter may work far more injury in the herd which it enters than would the former, but nothing much is ever thought of or aid of it. There are I believe tests for discovering the presence of the bacillus abortus, as well as for locating germs of tuberculosis—why not employ them? I trust before very long to see the day when immunizing serum treatments such as have done so much to check the spread of hog cholera and other contagious live stock curses, may be developed and perfected and rendered available, in a wholesale war upon abortion and similar dairy calamities.

GOOD FARM BUTTER

The butter made on the farms may be materially improved in quality in most cases if standard methods are employed and greater care is exercised in carrying out the following necessary details:

1 Produce clean milk and cream. Cool the cream immediately after it comes from the separator. Clean and sterilize all utensils.

2. Ripen or sour the cream at from 65 degrees to 75 degrees F. until mildly sour. Always use a thermometer, in order to know that the right temperature is reached.

3. Cool the cream to churning temperature or below, and hold at that temperature ofr at least two hours before churning.

4. Use a churning temperature—usually between 52 degrees and 66 degrees F.—that will require 30 or 40 minutes to obtain butter.

5. Clean and scald the churn, then half fill it with cold water, and revolve until churn is thoroughly cooled, after which empty the water.

6. Pour the cream into the churn, through a strainer.

7. Add butter color—from 20 to 35 drops to a gallon of cream—except late in the spring and early in the summer.

8. Put the cover on tight; revolve the churn several times; stop with bottom up, and remove stopper to permit escape of gas; repeat until no more gas forms.

9. Continue churning until butter granules are formed the size of grains of wheat.

10. Draw off the buttermilk through the hole in the bottom of the churn, using a strainer to catch particles of butter. When the buttermilk has drained out, replace the cork.

11. Prepare twice as much wash water as there is buttermilk, and at about the same temperature. Use the thermometer; do not guess at temperatures. Put one half the water into the churn with the butter.

12. Replace the cover and revolve the churn rapidly a few times, then draw off the water. Repeat the washing with the remainder of the water.

13. The butter should still be in granular form when the washing is completed.

14. Weigh the butter.

15. Place the butter on the worker, and add salt at the rate of three-quarters of an ounce to a pound of butter.

16. Work the butter until the salt is dissolved and evenly distributed. Do not overwork.

17. Pack in any convenient form for home use and make into one pound prints for market, wrapping the butter in white parchment paper and inclosing in a paraffin carton.

18. Clean the churn and all butter-making utensils.

ESTABLISHING A LONG LACTATION

The cow's first lactation period is an important one because in a measure it paves a path which she is inclined to follow in all her successive lactation period and everything should be done to induce a large flow of milk throughout the period, lengthening it as much as possible. Poor cows might be compared to many of our hilly, crooked roads of today, which are the results of ancient trails followed by animals or early settlers who had no intention of mapping out a road. They followed the lines of least resistance through the dense forest and as woods were cut down and settlers took possession, they continued to follow the established path. It is somewhat the ame with a cow. Establish a long lactation period at first and she will maintain it, not only in her own that follows, but she will impart the characteristic to her offspring.

Patented milk distributing device used in the New De Laval (sectional view)

Some big advantages that you can obtain only in the

NEW DE LAVAL CREAM SEPARATOR

GREATER CAPACITY: Without increasing the size or weight of the new bowl, its capacity has been increased.

CLOSER SKIMMING: The improved bowl design, together with the patented milk distributor, gives greater skimming efficiency.

EASIER TO WASH: Simpler bowl construction and discs, caulked only on the upper side, make the bowl easier to wash.

HAS SPEED-INDICATOR: Every New De Laval is equipped with a Bell Speed-Indicator, the "Warning Signal" which insures full capacity, thorough separation, proper speed and uniform cream.

EASIER TO TURN: The low speed of the De Laval bowl, the short crank, its unusually large capacity for the size and weight of the bowl, and its automatic oiling throughout, make it the easiest and least tiring to the operator.

WEARS LONGER: Due to its much lower bowl speed, high grade of materials used, and careful and exacting workmanship, the De Laval outlasts and outwears other makes by far.

ASSURED SERVICE: In almost every locality there is a De Laval representative, able and ready to serve De Laval users.

If you haven't the spare cash right now, that need not stand in the way of your getting a New De Laval at once. We have an arrangement with De Laval agents which makes it possible for any reputable farmer to secure a De Laval on the partial payment plan—a small payment at the time of purchase and the balance in several instalments—so that your De Laval will actually pay for itself while you are using it and getting the benefit from it.

WHEN THE CALF SCOURS

When the calf gets scours it is an indication that something is wrong with the feeding. It has either been overfed, been given milk that is sour or cold, been fed sweet milk one meal and sour the next, or the pails or the troughs are dirty. Indigestion is the cause of scours, so in treating the trouble the first thing to do is to correct the conditions that brought on indigetion. Then give a dose of castor oil in milk and follow with the formalin treatment. This consists in giving one tablespoonful of formalin solution to 15½ ounces of water, in each pint of milk fed. Only half the usual There are other remedies but this has been highly recommended.
amount of milk should be given at a can be increased to normal again.

LIVE STOCK.

STRONG DEMAND FOR GOOD BERKSHIRES

J. R. Semple & Son, Truro, N. S., writes:—

"The demand for good Berkshire pigs has never been stronger. During the fall and early part of the winter we sold boars to the following:—One young boar to A. C. Servant, Yarmouth, N. S.; two to W. B. Mitchel, Halifax. One boar pig to George Oland, Coxheath, N. S., and one to Ralph Secord, Penobsquis, N. B. We shipped a nice bred sow to J. Mac O'-Brien, South Nelson, N. B.

These pigs were all sired by Woodstock Pat 39178. He was Champion Berkshire boar of the Maritime Provinces 1916-1917 shows, and his get seem to be following his example. The 1917 Champion sow was sired by him, and the heaviest prize-winners in the under year classes were sired by him. He is the best breeder, as well as the bst individual that we have ever owned. Some of our spring pigs will be sired by him. And some of his daughters have been bred to Concord Duke 6—47626. Concord Duke 6 is a litter mate to the boar being used at the Central Experimental Farm at Ottawa, Ont. Mr. Rothwell, (the assistant Animal Husbandman at Ottawa), said that their boar was the best for his age that he had ever seen, and Mr. Teasdale (the breeder), said that ours was just as good. We are looking forward to getting some extra good pigs from Woodstock Pat's daughters, and sired by Concord Duke 6.

Concord Duke 6 is out of a litter of fourteen, and all were raised. We expect a number of litters, quite a few of the pigs are already ordered. We still have the 1916 and 1917 Champion sows, besides a number of sows of the same breeding. Although it has been a pretty hard winter on pigs, as well as other stock, ours have come through first-rate and I wish you could see them.

Both the 1st prize yearling sow and the 1st prize 2 year old sow of the 1917 shows, have been bred to Woodstock Pat for April and May litters. We have also kept six of his daughters, all of them are bred to Concord Duke 6 for March, April, May and June litters. The Champion sow of 1917 and a daughter of the 1916 Champion sow, have both farrowed nice litters by Concord Duke 6. They are selling fast. It is no wonder considering their breeding.

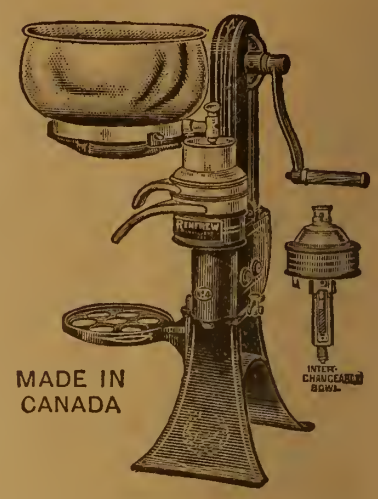
Butter Prices Will Be Maintained

THE Food Controller for Canada states: "I do not expect that the sale of oleomargarine will result in any reduction in the price of butter. The overseas demand is practically unlimited --- For years after the war Europe will require all the butter which Canada can produce for export, and the prices are certain to be high."

High prices for butter make every pound of butter-fat saved a source of extra profit that is a revelation to many farmers and dairymen. The

Renfrew

saves you about one half-pound of valuable butter-fat, per cow, per week, over other machines, even if they are in running condition, and much more if they are not running properly. Multiply this half pound by the number of cows in *your* herd and then calculate what this means to *you* in dollars and cents per year. Will it pay you to continue losing money by using an ordinary machine? The Renfrew gets all but the last three ounces of butter-fat in a ton of milk skimmed.



Which would you rather sell at present prices?
10 Gallons or 7 Gallons
of good firm butter-fat from the Renfrew which gets all but 1-10 pound in every 1,000 lbs. skimmed.
butter fat from other machines which lose a whole pound in 1,000 lbs. of milk skimmed.

Besides quantity, the Renfrew gets *quality*, Good first-class cream means globules of fat unbroken, and better, firmer butter. This high quality of cream is secured by the exclusive curved wing centre-piece of the Renfrew, which distributes the milk to the discs in thin sheets, and prevents the slapping of milk and breaking up of the fat globules, which occurs with the ordinary straight wing machines.

Our illustrated booklet gives Government Dairy Schools proofs of the close skimming. Also read about the Renfrew's exclusive interchangeable-capacity feature, self-oiling system and many other modern advantages. Write for booklet today.

NOTICE.—The Renfrew Separator illustrated here was formerly sold under the name "Standard," which identified it as a high efficiency cream separator. The name "Renfrew" has been used on the same machine for several years for our United States and foreign trade and under that name has become as popular in those markets as under the name "Standard" in Canada. Now the name "Renfrew" has been adopted for Canada so as to link the name more closely with that of our company and so that we can sell the machine under a uniform name throughout the world.

HANDLING THE FLOCK DURING THE LAMBING PERIOD

This circular is intended primarily for boys and girls in lamb clubs and for those who have not had experience with sheep during lambing time. It may, however, contain a few suggestions which experienced sheepmen can use to advantage. Many handle their flocks successfully without providing themselves with all the equipment and supplies listed herein, but everything mentioned has been successfully employed in saving either lambs or their mothers. It is also true that many sheepmen carry their flocks thru the lambing period and experience few if any of the ewe and lamb troubles discussed in this connection; the fact that the troubles are discussed should not discourage anyone who is thinking of raising sheep.

In Preparing for Lambing—

(a) Plan the farm work so that the shepherd can keep a close watch over the flock both day and night.

(b) Keep the ewes that are about due to lamb away from the other kinds of live stock. Large animals may injure them; hogs greedily devour young lambs.

(c) In cold weather provide warm quarters, well bedded and exposed to the sun, but do not overlook ventilation. Give the ewes plenty of room (12 to 16 square feet each, unless closer crowding is necessary in order to keep the quarters warm). Close all openings thru which young lambs might creep and wander away.

(d) Have a few portable lambing pens, 4 feet x 4 feet or 4 feet x 6 feet. (Such a pen is the best place for a ewe and her lamb until the lamb is two or three days old.)

(e) Certain supplies should be on hand, such as:

1. Liquid sheep dip to be used as a disinfectant.
2. Epsom solts, castor oil, and raw linseed oil to be used as physic.
3. Tincture of iron, gentian and ginger to be used as a tonis.
4. Soap to place in water intended for injections to relieve constipation.
5. Tincture of iodine to be used on swollen udders and on navel cords to prevent "navel ill".
6. Swan-bill nipples for feeding milk to young lambs.
7. A metal syringe provided with a large nozzle and also a small one suitable for giving injections to young lambs.
8. A glass graduate for measuring doses of medicine.

Caring for the Ewe

During the Last Few Days Before Lambing, pen the ewe at night where it is intended she shall be until the lamb is a few days old. Avoid crowding and jamming in doorways and around feed racks. Give good, clean, palatable feed, consisting mainly of roughage.

When the Ewe is Giving Birth to the Lamb, do not disturb her so long

18

as everything seems to be going well. If she must have help (which she should have if little or no progress is being made after much laboring), the first thing to do is to learn what position the lamb is in. To be delivered alive, it should be presented fore feet first, with the nose lying snug on the fore feet (this is the normal position for birth), or it may be delivered hind legs first. Before entering the ewe to get the lamb into the proper position, the hand should be disinfected and smeared with vaseline or oil. Care should be used not to tear the parts of the ewe, and it may be inadvisable for a person with a large hand to attempt the operation. Pull steadily on the lamb slightly downward toward the ewe's udder and use most strength in pulling when the ewe labors. Be sure to keep the head coming with the fore feet until the nose is exposed.

After the Lamb is Born, give the ewe close attention for several days. Note whether she casts the placenta (after birth) and whether her bowels are normal. Watch her udder. Milk her if the lamb does not take all of the milk. Do not expose her to cold drafts. Give her all the water she wants but not large quantities at one time and it should not be ice cold. Give her good feed, such as clover hay and oats; allow grain sparingly for two or three days after the lamb is born, unless she is in thin condition.

After the Lamb is a Week Old, the ewe must have plenty of feed until there is an abundance of grass; and abrupt changes in her ration should be avoided.

Do Not Worry if the Ewe Refuses to Eat for the First Three to Six Hours after Lambing, but if she continues to refuse feed, make sure that her bowels are in good condition. Four ounces (one-third pint) of raw linseed oil, or 4 or 5 ounces of Epsom salts dissolved in water, is a good physic. For a very quick-acting physic, 2 ounces (4 tablespoonfuls) of raw linseed oil with 4 ounces of Epsom salts may be used. To aid the appetite, give three times daily a teaspoon each of tincture of gentian and ginger in one-half pint of luke-warm water. If the ewe is in thin flesh, add a teaspoonful of the tincture of iron to each dose.

A Ewe Lacerated Inwardly or Failing to Fully Cast the After-birth after Lambing, should be washed out daily with injections of boiled water that has been allowed to cool, or with a liquid dip diluted 1 part to 100 parts of water.

When the Ewe's Udder is Swollen, keep it milked out and paint it twice a day with tincture of iodine until the swelling begins to go down, and thereafter paint it once a day until it is evident that further treatment is unnecessary. If pus forms, make an opening for drainage and wash the affected part once a day with a good disinfectant. Ewes with swollen udders should be removed to comfortable quarters outside the sheep barn, for their trouble may be caused by an infection that will spread thru the flock. Since their milk is often poisonous, their lambs should be taken away from them and fed by hand until the swelling subsides.. Be sure not to let the lambs nurse from other ewes, for this may spread the disease.

Sore Teats in ewes are most often caused by the formation of poc-like sores, but sometimes by the long, sharp teeth of the lamb. The first symptom of the poc sore is a whitish pimple or blister. As soon as the sores are discovered, they should be opened and washed twice a day with a solution of sheep dip, one part to twenty-five parts of water. If the lamb's teeth make the teats sore, about the only thing to do is to take the lamb away from the ewe. When the teats are very sore, the ewe refuses to let the lamb nurse; hence the shepherd should see to it that she is kept milked out.

Caring for the Lamb

When the Lamb is Born, place it and the ewe in a pen measuring 4 feet x 4 feet, or 4 feet x 6 feet. Little attention need be given the strong lamb, whose mother has milk, except to see that it finds the teat. If its mother has no milk, it is best at first to take a little from a ewe that has more than enough for her lamb. The next best thing to do is to feed whole cow's milk, using about two tablespoons every two or three hours. The milk should be heated to about 90°F. in a bottle placed in warm water. In order to give the milk at proper temperature, the bottle and the water should be in a pail which can be taken to the place where the lamb is to be fed.

A Lamb too Weak to tSand to Nurse should get a fill of its mother's milk as soon as possible. If it is anxious to nurse, back the ewe into a corner and hold the lamb to the teat and increase its anxiety to feed by patting it on the rump. If it refuses to nurse, draw some milk from the ewe and feed the lamb from a bottle until it gains in strength and develops a strong appetite.

One of the Best Ways to Handle a Chilled Lamb is to place all but its head in as warm water as the elbow can bear. As the water cools, put in more warm water to keep up the temperature. When the lamb becomes somewhat lively, take it out of the bath, and rub it briskly with a coarse cloth until it is almost dry. Then feed it, wrap all but its nose in a thick blanket or cloth, and place it in a warm place to sleep. Keep it away from its mother no longer than absolutely necessary. Always wrap a lamb in a cloth when placing it in artificially heated quarters.

When the Ewe Disowns her Lamb, try to get her to claim it. A ewe recognizes her lamb at first wholly by smell. This being the case, it may help to smear on her nose and on the rump of the disowned lamb some milk drawn from the ewe. Another procedure is to tie the ewe in a small pen where it is easy to hold her and force her to let the lamb nurse often and being tied it is difficult for her to get away from it. When the disowned lamb is one of a pair of twins, both lambs should be place in a pen next that occupied by the ewe so that she can see them, and both should always be put with her at the same time. In her anxiety to nurse the lamb she claims, she is likely to let the other one nurse also.

If a ewe with a good supply of milk is left without a lamb, an attempt should be made to have her raise one, an orphan or one not getting enough milk from its mother. If she has just lost a lamb, it is usually easy to get her to take another by immediately removing the skin of the dead lamb and placing it on the stranger intended for her. If this proceeding is not possible, the suggestions given above for getting a ewe to claim her own lamb may be employed.

Common Ailments and Diseases of Young Lambs

"Pinning" is a collection of sticky dung clinging to the wool around the anus. It should be scraped away with a stick or a corn cob.

Constipation is indicated by straining and distress in the attempt to pass feces, or dung. Injections of luke-warm soapy water should be given, and it will help if a tablespoon of castor oil or milk of magnesia (hydroxid of magnesia) is given.

White Scours in lambs are caused by digestive disorders which usually result from mistakes in feeding the ewe, and hence are to be avoided largely by giving the ewe clean, wholesome feed and not changing the ration abruptly. A lamb having white scours should be taken away from the ewe and allowed only a little of the milk. This can best be accomplished by milking the ewe out before letting the lamb nurse Milk of magnesia given as suggested for constipation will help to correct the disorder.

Acute Digestion sometimes seizes young lambs. It is marked by great distress and frothing at the mouth. Castor oil (a tablespoonful) is a good remedy.

For Sore Eyes put a drop or two of a 16-percent solution of argyrol in the eyes once each day. This should be done with an ordinary medicine dropper.

Navel Ill should be avoided by dipping the navel cord in a cup of the tincture of iodine soon after the lamb is born.

For Scabs or Poc-like Sores on the lips and nose, apply a fairly strong solution of sheep dip after the sores have been rubbed open.—By W. C. Coffey.

THE HORSE

YOUNG COLTS WHEN WELL FED REDUCE THE COST OF FARM POWER TO LOWEST LIMITS

There are not a few farmers who act with their hores during the winter months much in the same way that they do with their implements. They are neglected when not in use and have many breakdowns in the busy season. This is especially true of the work horse, and the case of the young colt is omewhat similar. Every farmer knows that a machine with parts badly adjusted, or is of inferior quality of material is never a very satisfactory article. In the same way the young colt that has had careless attention paid to it during the first two or three years of its life will never become the spirited, healthy animal that his breeding gave promise. It is the first two or three years that determine the utility of the colt. The winter treatment is the factory for the motive power in hore flesh at the farm, and neglect of the colt is similar to the carelessness if the manufacturer who sends out his manufactured article in bad shape and poor quality.

Influence of Early Care

How careful the interested dairyman is over the treatment and progress of the heifer calf that he has in view to become capable of producing a high yielding record. She must be able by virtue of her good health to exercise her qualities fully developed. The rearing of the young horse demands the same interest, the breeder must see the end from the beginning and know what results to expect from the treatment given.

The life history of all farm live stock can be written when a study of their early surrondings and treatment is granted, and colts are more susceptible to neglect than any others, and never outlive its evil influences. Spirit in a colt is its natural heirloom and easily retained, but as easily destroyed. To retain this natural quality and encourage its further growth ought to be the aim of every rearer of horses. The most vital period in their fife, where spirit and courage can be crushed, is at weaning time and two succeeding years.

Danger of Lonely Stall

How few consider that confining a colt to a dark, lonely, and badly ventilated stall, is one way of preparing him to become an inefficient labor machine. Many of the ills that come to it in after life, are contracted in the dark and isolated corner. Like an exile from domestication's influence, he quietly suffers to permanent injury to the eyesight, to the hoofs, and the digestive organs, that finally result in a conformation ill able to defend itself against attack disease, or bear up in the strenuous day of labor on the farm. Eyesight in a horse is a very valuable asset and many more horses are partially blind and have eye diseases than many farmers are aware of. And the dark stable is the chief cause.

A Question Worth While

Many a horse has become diseased, nervous or vicious, through incompetence or inhumanity of stable treatment of the colt. If so much depends upon the treatment of the colt the question naturally arises; who does the feeding and the caretaking. Is it the owner himself, or anyone that happens around, giving the colt a variety of attendance and feeds, good, bad or indifferent. The power and longevity of a horse is in exact ratio to the intelligent care and feeding he receives at all times, and the colt stage most necessary of all. In the winter months, feedinig by hand must be done. Who does the feeding? Is he competent? This is a question worth while to the horse industry.

The first lesson in hand-feeding oung colts has to be taken from nature. When the horses roamed the prairie wild and free, speed of limb was their only method of saftey when their natural enemies appeared, and nature biult them with a small food carrying capacity. Therefore they were always ready for the flight. Even the young colt, that is only an hour or so old, is as fleet of foot, if not fleeter, than its mother. One or two sucks seem to satisfy it at one time, but it requires them often. And therein lies the success of the feeder of the young colt after it is weaned. Feed of good quality, fed in small quantities, and fed often, is preparing the horse to become the best economic motive power on the farm. The farmer who allows his colts to get as thin in flesh in winter as it takes in summer grass and freedom to bring them back again to noormal, is mis-spending his time and losing money on the horse enterprise as well as paying a heavy bill for labor.

Feed and Labor

Young horses must be kept growing and improving all the time from the day they arrive to the time they are matured and competent for their heavy work. For this reason it is necessary that the caretaker should keep the foals, yearlings, two-year-olds and three-year olds fully supplied with an adequate amount of nourishing food every day throughout the winter. They must keep on thriving from one month's end to another, without a break or setback through one week or one day's inattention.

If the newly-weaned colt has to rustle in a pen or yard with animals a year or two older, the chances are that however well fed the bunch are, collectively, the young fellow will fare badly in the struggle. Exercise is necessary on every suitable day, but individual and special feeding must be given the colt that had been weaned in the past fall. Oats are preeminently the horse grain, and though expensive meantime they can be very profitablly fed to a young colt in his first year. "Though it is the eye of the master that fattens his cattle," the

STUCCO BOARD

comes lower in cost than sheathing lumber, furring strips and lath, which it replaces. Also, it is simple to work with, saving labor and time.

Made of heavy sheets of sized sulphide fibre board, surfaced on one side with asphalt mastic, it is reinforced on the other side with bevel-edged lath, which holds stucco or plaster firmly. It comes in panels 4' by 4', but if longer lengths are required, same will be run on request.

A happy combination— cheapest and best, simple, solid, permanent, sanitary,

The saving over ordinary stucco construction averages over 25%. Write for samples and full information to 89

BISHOPRIC WALL BOARD CO.
LIMITED
259R Bank Street, Ottawa, Ont.

recognized average allowance for colts measured in oats, is as follows: Up to one year of age, from 2 to 3 pounds from one to two years, 4 to 5 pounds; from two to three years of age, 7 to 8 pounds. The allowance of hay should be all they will eat; a liberal allowance before them all the time. At the colt age they are in their natural stage and the natural appetite of the colt will balance its needs in the matter of hay. But when once they are broken in to harness and work, and have fasting and working spells alternately, then a limited quantity of hay should be given and more grain. If any farmer put in his two-year-old colt in harness for training, the grain ration must be increased to 8 pounds and a limited quantity of hay, and the three-year-old in training as much as 12 pounds.

Liberal feeding must be counterbalanced by an abundance of out-door exericse. In no other way can colts eb ruined so surely and permanently as by liberal feeding and close confinement. Each day from three to ten hours should be spent in the open air, acocrding to the condition of the weather and other circumstances. The more feeding the more exercise is required; a highly fed colt should be out of doors for eight hours a day. A colt will grow rapidly when liberal and nourishing feed is given him, provided he gets the opportunity for plenty of exercise. The skill of the feeder is shown where the balance of feed and exercise is finely adjusted.

Roots and Water

Roots have a cooling and beneficial effect on the dry and concentrated winter feed of the colt, and one or two mangels or turnips will be a beneficial addition to the daily ration.

As to water they hould have all they want at all times. In stinting the young colt his quantity of water too much is taken when he gets a chance, and in the winter time when it is ice cold, this will do irreparable damage to the digestive organs and threfore stunt his growth. Even thirsty colts will sometimes refuse to drink ice cold water in the morning. Make arrangements to have water before them at all times in the manger.

At the approach of springtime teething troubles bother the colt and ice cold water gives pain and hence many a colt is cruelly treated when not accommodated with water of a lower temperature.

And finally a word about the feeder. The man who looks to the comfort of the colts during each winter, feeding and caring for them with intelligient consideration as a unit of efficiency in the horse breeding industry, as well as the best medium in keeping the cost of farm horse power down to its lowest imits.—O. V. T.

THE EXPERT JUDGE AND COMPETENT BUYER OF HORSES

Thestudent seeking an intimate acquaintance with the points and characteristics of the horse, that he may become an expert judge and competent buyer and breeder, will overlook many little matters of considerable interest, unless his attention is directed to them by a trained horseman. Some of these will be set down here, and naturally those relative to the head will first be considered.

Starting with the ears it not only is necessary to remember that these organs should be of good quality and proportionate in size to the body of the horse, but that they are sound. The ear of "quality" is comparatively small, and is covered with fine skin and hair. Long, coarse hair in the ears denote common blood, grossness and phlegmatic temperament. It is most often seen in the heavy draft horse and usually has been removed from the ears of the runner, trotter, carriage or light work horse. If clipping has been done and it is noticed that the hair ("feather") has also been clipped from the fetlocks, depend upon it that the horse is coarse and of poor breeding for an animal of light breed. If the hair in the ears is long and coarse, similar coarse hair will be found under the jaws, upon the legs and under the belly. Such hair is highly objectionable in horses of light breed, and relatively so in heavy draft horses, America nhorsemen objecting to the great profusion of hair characteristic of Shire horses considered of show type in England. Fine hair grows from thin, good quality skin, and that usually overlies bone of dense ivory texture.

Small ears and small eyes commonly go together, and such features are objectionable. They once were common among the French breeds of draft horses, but are being bred away from year by year. The ears should be alert, perfectly under control, and directed at an angle of approximately 45 degrees. Rigid ears denote deafness or paralysis from lockjaw. Restless ears may indicate deficiency of vision, excessive nervousness or actual vice. Ears laid back make the horse "scowl" as it is called, and one i warned to look out for biting and kicking.

When buying a horse remember to handle the ears. If the horse objects, the reason may be a previous attack of "poll evil," disease of the ears, or the fact that a twitch has had to be put upon the ears to make shoeing possibile. The examination also will show if the ears are kept erect by meanrs of a silken thread tied from one base to the other, or kept still by means of a leaden pellet suspended in ear by a thread stuck to the skin with hoemaker's wax. One should also make sure that a split ear has not been temporarily glued together and that there is no discharging fistula at the base of the ear, or excoriation of the skin indicating the use of the twitch.

A white star in the centre of the forehead is regarded as a "beauty spot," but it should be natural, especially in a purebred registered horse, in which it is a mark of identity. An artificial star made by the application of a boiling hot potato, boiling water or a caustic always has a patch of bald skin in its centre.

Coming to the region of the eyes remember that a deep depression above the eye, or supra orbit, as it is

$125.00 Profit in 10 Days—My Free Book Tells How

What Others of My Students Are Doing
(See my free book for more amazing successes)

Mr. S. L. Arrant writes: "Just to test your methods, I bought the worst balky, kicking, fighting horse I could find. Paid $65.00 for him. After handling him only a few hours according to your methods I sold him for $185.00.

Mr. Dell Nicholson, Portland, Mich., writes: I have trained a four year old mare that was given up by everybody. Bought her for $35.00 and now have her so gentle, my little boy handles her. Wouldn't take $200.00 for her.

Dean L. Smith, Findlay, Ohio, writes: By following your instructions have changed a worthless, dangerous balker into a horse worth $225.00.

Everett McBlock, Elkhart, Ill., writes: Have just broken a pony to drive and taught it some tricks. Owner bougbt it for $17.50. Paid me $40 to train it. He just sold it to a show company for $150.00.

Write today for my free book. See for yourself how my system of horse training enabled Chas. H. Mackley of Unadilla, New York, to make $125.00 profit on a single deal. In my free book Mr. Mackley tells how he took a vicious mare that hadn't been harnessed for seven months and in 10 short days had her as gentle an animal as you could wish to drive. He then sold for $175.00 the horse he picked up for $50.00. This is only one of the amazing successes students tell in my book. What others are doing *you* can do.

I Will Teach You How to Master Any Horse

I will teach you by mail my famous methods of breaking and training horses. In a short time I teach you how to break in the wildest colt; how to cure the meanest kicker and balker; how to judge horses at a glance; how to cure every bad habit a horse can have. I will make you the master of any horse.

Big Fees in Horse Training

You can pick up nice money like Mr. Mackley does and you can also command big fees for breaking and training horses for others. My free book shows how.

The Recognized Specific of Diseases of the Horse

A sovereign remedy in powder form which cures, Coughs, Heaves, Colic, etc. It strengthens the work horse as well as the race horse, and enables them to do more and better work. It has been successfully prescribed by many veterinarians notably by Dr. J. D. Duchene, in many critical cases, where results have proved remarkable.

A 50c box will be sufficient for six days' treatment.

DR. ED. MORIN & CO., LIMITED, - - Quebec, Canada

POULTRY.

FEEDING YOUNG CHICKENS

Young chickens should be fed from three to five times daily, depending upon one's experience in feeding. Undoubtedly chickens will grow faster when fed five times than when fed only three times daily, but it should be borne in mind that more harm can be done to the young chickens by over feeding than by under feeding.

Young chickens should be fed not more than barely enough to satisfy their appetites and to keep them exercising, except at the evening or last meal, when they should be given all they will eat. Greater care must be exercised not to feed young chicks that are confined more than those that have free range, as leg weakness is apt to result in those confined.

The First Feed in 24 Hours

The young chicks may be fed any time after they are 36 to 48 hours old, whether they are with a hen or in a brooder. The first feed may contain either moistened hard-boiled eggs, johnny-cake, stale bread, pinhead oatmeal, or rolled oats, which feeds or combination may be used with good results. Mashes mixed with milk are of considerable value in giving the chickens a good start in life. The mixtures should be fed in a crumbly mssh and not in a sloppy condition.

Johnnycake composed of the following ingredients in the proportions named is a very good feed for young chicks: One dozen infertile eggs or one pound of sifted beef scrap to 10 pounds of corn meal; add enough milk to make a pasty mash, and one tablespoonful of baking soda, and bake until done. Dry bread crumbs may be mixed with hard-boiled eggs, making about one-fourth of the mixture eggs, or rolled oats may be used in place of the bread crumbs.

Feed the bread crumbs, rolled oats, or johnnycake mixtures five times daily for the first week, then gradually substitute for one or two feeds of the mixture finely cracked grains of equal parts by weight of cracked wheat, evenly cracked corn, and pinhead oatmeal or hulled oats, to which about 5% of cracked peas or broken rice and 2% of charcoal or rape seed may be added. A commercial chick feed may be substituted if desired. The above ration can be fed until the chicks are two weeks old when they should be placed on grain and dry or wet mash mixture.

Place Dry Mash in Hoppers

After the chicks are 10 days old, good growing mash, composed of two parts by weight of bran, two parts middlings, one part corn meal, one part low grade wheat flour or red dog middlings, and 10% sifter beef scrap, may be placed in a hopper and left before them all the time. The mash may be fed either wet or dry; if wet, only enough moisture (either milk or water) should be added to make the feed crumbly, but in no sense sloppy. When this growing mash or mixture is not used, a hopper containing bran should be accesible to the chickens at all times.

After the chickens are two months old they may be fed four times daily, with good results. After they are three months old, three feedings a day are neough.

Milk Hastens the Growth

As soon as the chickens will eat the whole wheat (usually in about eight weeks), cracked corn and other grains, the small-sized chick feed can be eliminated. In addition to the above feeds the chicken's growth can be hastened if they are given sour milk, skim milk or buttermilk to drink. Growing chickens kept on a good range may be given all their feed in a hopper, mixing two parts by weight of cracked corn with one part of wheat, or equal parts of cracked corn, wheat and oats in one hopper and the dry mash for chickens in another.

The beef scrap may be left out of the dry mash and fed in a separate hopper, so that the chickens can eat all of this feed they desire. If the beef scrap is to be fed separately if is advisable to wait until the chicks are 10 days old, although some poultry men put the beef scrap before the young chickens at the start without bad result.

Chickens confined to small yards should always be supplied with green feed, such as lettuce, sprouted oats, alfalfa or clover, but the best place to raise chickens successfully is on a good range where no extra green feed is required. Where the chickens are kept in small, bare yards fine charcoal, grit and oyster shell should be kept before them all of the time, and cracked or ground bone may be fed. The bone is not necessary for chickens that have a good range.

BREED ONLY WINTER LAYERS

If winter egg production is desired, only winter layers should be bred. It is easy to elect the laying hen. Her comb is bright and red and her pin bones will be well spread apart. Prof. Kemptster suggests that observations be made during the winter so that the poultry keeper will know which of his hens are good layers. These sould be marked so that they may be used for mating next spring.

It is folly to breed from the entire flock. By selecting a few of the best layers, the most progress will be made. Where no selection is made, the poor producer will be used for breeding, because even the loafers will lay in spring. It is also a mistake to breed from the immature and undersized stock. Over-fat, coarse-boned hens or those which crop behind should never be put in the breeding pen. The best place for them is on the table. Pick out the good breeders and note the improvement. They should be placed by themselves with a good vigorous male when breeding time comes. By using a smaller number of males the poultry man can afford better stock.

MAKING THE SMALL FLOCK PAY

The following interesting acocunt of the handling of a flock of hens in a city backyard is contributed by Geo. Robertson, of the Poultry Division Experimental Farm, Ottawa. Though written with the idea of suggesting to city people a profitable means of producing a very necessary foodstuff in these war times, the article will be of interest to poultry keepers in the country as well. Mr. Robertson's letter follows:

A dozen hens in the backyard should supply the avcrage family with new laid eggs more cheaply than eggs can be bought during the winter and as a business proposition such hens pay. Further, to demonstrate this, a small experiment was conducted by the Poultry Division of the Experimental Farm, Ottawa. The details are supplied by Mr. George Robertson, who kept the flock in his own backyard.

The birds were not selected with a view to the greatest production possible, but rather to the securing of such a flock as any amateur might go out and purchase. The flock consisted of twenty-six birds—four of which were three-year-old Brack Leghorn hens, six White Leghorn pullets and one Black Minorca pullet hatched in May and the balance were crossbreds, Black and White Leghorns, hactched in June. They were not put into winter quarters until well on in November and it was December 7 before the first egg was laid.

An old woodshed about eleven by twelve feet was utilized as a poultry house. Inthe south side, fifteen inches from the floor, a line of windows two feet wide was placed and above these

EGGS FOR HATCHING!

Breed Standard bred poultry and more of it. Eggs or stock from every popular variety can be had through our Association.

Eggs from all heavy breeds such as Bramahs, Plymouth Rocks, Wyandottes, etc.. $2.00 for 15 eggs.

Eggs from the lighter breeds such as Leghorns, Minorcas and Black Spanish, etc.. $1.50 for 15 eggs.

an opening about eighteen inches in width was made across the entire front. In this a frame covered with light cotton was hinged. This frame was kept hooked up to the ceiling through the day, except in the severest weather. Hoppers of oyster shell, beef crap and dry mash were kept constantly before the oock. The dry mash consisted of bran, middlings and cornmeal, equal parts, one-half part gluten and one-half part blood bour. A deep straw litter was kept on the floor into which all whole grain fed wa scattered.

In the morning mixed grain, usually cracked corn, wheat and oats, equal parts was given. At the same time warmed water was given. At noon the water was renewed and all the kitchen waste, such as vegetable parings, was fed. Usually at this time a few handfuls of mixed grain were also scattered. In the winter, as it is always dark before the night feed, which consisted of mixed grain, was given, an electric light was turned on for a couple of hours and the fowl allowed to scratch to their heart's content.

MANY USES FOR COLONY HOUSES

Every poultry keeper and farmer can find use for several small houses from six to ten feet square. They are needed particularly in early spring to house the brooders and early broods. They are useful to raise the chicks during the summer and fall. They make excellent quarters in which to confine an fatten the cockerels for breeders.

With a few rods of wire fencing and half a dozen posts a choice pen of breeding stock can be separated from the general flock and their eggs served for hatching. A good type of colony house is made of two piano boxes and covered with roofing paper. Remove the tops and backs and set the boxes on 2 x 6 runners so that one top will fill in the floor and the other can be used at the back. The backs of the boxes will give enough material to build the roof and the door. Put a window each side o fthe door. Cover the building with a good grade of roofing and you will have a house that will last many years.

EGG EATING HABIT NOT HARD TO CONTORL

Occasionally a hen will acquire the egg-eating habit. This is due to one of two causes, either the hen is not being supplied with enough grit, and eats the shell for the grit contained in it, or by some accident an egg has been broken and she has learned that it gives her a good supply of protein. Both causes are due to the mismanagement of the owner. He should supply grit ofr his den and should provide a place where eggs may be laid wthoutdanger of breakage.

Once a hen has acquired this bad habit, the best thing to do is to kill her. Especially valuable hens may be broken of the habit by placing pepper in an egg which they are to eat. Another method of preventing a hen from eating the egg she lays is to make a nest of a piece of burlap suspended from the sides of the nest box and make a hole in the centre of the burlap the size of the egg. When the hen lays her egg it will drop through the hole out of reach.

STEAM OLD FOWL BFORE ROASTNIG

The saying "Tough as an old hen" has made old hen uninviting to most of us. However, old hen may be made most tempting by proper and thoughtful cooking.

Instead of putting the hen in a large quantity of water and boiling the flavor out into liquid, try steaming. If you hove not a regular steamer, make one out of a kettle and colander. Steam the fowl from one to two hours until tender.

It may then be stuffed and roasted, basting with some of the liquor in which it has been steamed, and is very tender and tasty.

After steaming, the fowl may be cut into uieces, the pieces browned in a frying pan, covered with gravy made from the liquor, thickening and seasonings, and allowed to cook until well fiavored. The gravy may be varied by using in it tomatoes, green or red peppers chopped fine, browned onions, celery seed or salt, or mushrooms. In recommendng mushrooms it is assumed that a home-canned or home-dried product be used.

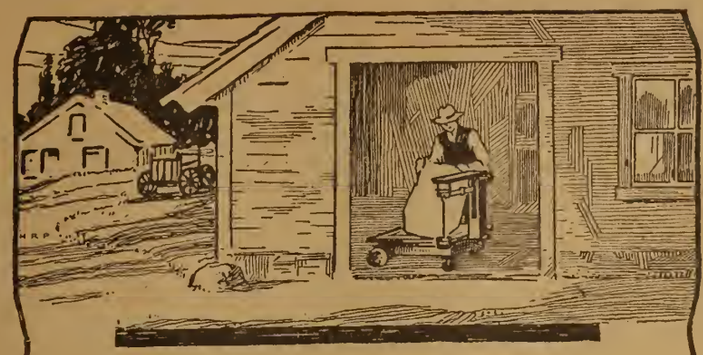
DISTINGUISHING GEESE AND GANDERS

It is a difficult matter to tell the sex of young geese. The gander has a longer neck and a thicker, heavier head than the goose. He also stands a little more erect. The body of the goose is deeper and she is generally more compact and closely built. If a dog or other intruder come near the ganders will put down their heads and hiss, while the geese hold up their heads. The voice of the gander is louder and shriller than that of the goose. An infallible test is to take each individual, turn it over on its back and with the fingers press out the private parts. Those of the gander are longer and slenderer than those of the goose. By examining a pair of older ones in which you know the sex, you can become familiar with the way they appear, and thus can tell the younger individuals.

TO DRAW A FOWL

Place the fowl on its back, and make a slit lengthwise in the skin of the neck from the body to the head; free the neck from the skin, and cut off the neck as close to the body as possible; then cut the skin, leaving a flap at least three inches long hanging to the breast. Loosen the crop and the windpipe, and insert the first finger, keeping it close to the inside surface of the body; work it round, breaknig all the ligaments with which it comes in contact, thus loosening the contents of the carcass. Be careful not to thrust the finger into the centre, for if the gall bladder is broken, the gall will impart a bitter taste to whatever it may touch. Turn the bird, slightly enlarge the opening at the vent, insert the finger and loosen th insides from the carcass at that end. Turn the bird again, and place it on its back; press the breast with the thumbs and push out the gizzard by the hole at the vent; take hold of it and pull steadily, whn the whole of the interior should be brought away entire. If all the insides are removed, little washing will be needed. Wipe it out with a damp cloth, or rinse quickly and wipe dry. If the breast bone protrudes too much, put a cloth over it and beat it down flat, putting something like a pestle inside to pound on.

When the hens are inclined to be lazy, throw a few handfuls of grain over the litter so as to set them to scratching.



The Handy Scales for Farm Use

Here is the handiest weighing outfit ever designed for farm use. Convenience and service are the chief features of the

Fairbanks Farm Scales

The handle at the base of the weighing post permits of ready transportation on its own wheels to any part of the farm buildings. In house or barn or dairy it serves any purpose up to 2000 pounds capacity.
The Fairbanks Portable Farm Scale has a low weighing post, is compact and absolutely accurate. The platform is 34 x 25½ inches and has a clearance of 11 3-8 inches above the ground.
Write our nearest branch for full details of this and other types of scales.

A QUESTION OF HONOR

"Hello, young fellow! Any trout in brook?"

In response to this salutation, Orlando Fudge, a bright farmer's lad of some sixteen summers, held up a string of meadow trout, ranging from one-half to a full pound each.

"Zounds, boy, that is a fine string. I will give you two cartwheels for them."

"Much obliged, sir, but father has all the cartwheels he needs at preent."

"Oh you don't catch on, my boy. I will give you two brand new silver dollars; understand that, hey "

"Reckon that is all they are worth, tranger. Guess you can have them."

The negotiatons completed, Mr. Thompson tucked the fish in his basket and proceeded down stream. He had only gone a few steps, however, when he turned and saw the lad was watching him.

"No harm fishing here young man?"

"Oh, no, fish all you have a mind to sir. Father don't post his brook. Should think he would, though. He is cranky enough about everything else."

Now, there was no disrespect intended in this remark of Orlando. The fact was, everyone that knew old John Fudge had called him cranky until it had become a misnomer in the neighborhood.

"You don't mean it. Well, my boy, here is my card, and when you come to the city, call and see me. By the way, what is your name?"

"Orlando Fudge, sir."

"All right, good by, Orlando."

"Good by, ir."

Orlando took the card and read, "C. F. Thompon, Gen. Mgr. Mainard & Goddard, Department House, City of W————."

"Oh, yes," said he, speaking aloud to himself. "I know where that is. I was in his store last May when I went to the circus. I will go up and see him sometime, for I am going to leave here pretty soon if father"——

At this juncture of his soiiliquu, he thought of his mother, and said : "Well, I guess I'll stay a while longer. I don't want to leave mother," and dismissed the subject from his mind.

Orlando Fudge had never been discontented with his lot, but this first money that he could call his own, awoke in him a new sense of life, and each time that he held the two silver dolalrs in his palm, they grew, and placing them under his pillow that night he dreamed of a world he had never seen, and of experiences he knew nothing of, but longed with the rising sun to investigate.

He had been reared on an isolated back-country farm, located in a valley rich with broad meadows, fertile pastures and fine elms. The house was antiquated and irregular. The windows sagged. The stone chimney was out of all proportion to the structure surrounding it, and crumbling with age. God's eternal sunlight seldom penetrated the shade and clinging vines sufficient to throw its beams into any room. The old house stood back from the public highway, a mile at least from its nearest neighbor, yet Orlando had never yearned for other surroundings, had never thought to be lonesome. All nature had been his playmates. The domestic animals, including his faithful dog, his playmates. His mother, God bless her, one of those sweet souled women that brighten the dark piaces on earth with their smile, christening the hard things of life with their silent tears, forgiving but never quite understood; and a contrary, close-fisted, suspicious, one-sided chap for a father. Such were his daily companions.

A few weeks subsequent to his meeting Mr. Thompson, Orlando Fudge found himself master of ceremonies, so to speak. His father's guardian angel had tired of trying to make him like other people and he had gone—gone the way of the world.

The duties of carrying on the farm devolevd upon him and his mother. A labor of love under adverse circumstances. Business relations took him to the city where he frequently met Mr. Thompson. Returning from one of these trips, he approached his mother on the subject of selling the farm and going to the city to live .

So the stock and crops were sold. The old home posted, "For Sale or Rent." The beautiful trout stream, where Orlando was wont to fish on quiet summer days, was leased to a city club and the fields and haunts of his boyhood knew him no more for a time.

A position was offered him at the Department Store in W———, and a new book, with the index finger pointing at a new chapter in ife's drama, was opened to him. How well he read that book, future developments will tell.

Fear was a composite he knew nothing of as he demonstrated shortly after his iadvent into the new position. Standing at the store door one morning, a few weeks later, he was hailed by Richard Jarvis, a fellow clerk.

"Say, Fudge, isn't that a dandy team. Wonder who owns that pair of blacks? Seldom see such a team as that on a hay wagon, especially on an old farmer's."

At this moment, Orlando glanced at driver and hores and replied: "Why that is Mr. Drake from down our country. I know him well. He always has the best team in town. Who would think they had pulled that load ten miles this morning by the way they drive?"

"Gee, I would like a chance to drive that team, Fudg."

An hour later a cry was heard in the street. "Look out for the runaways!" and coming down the road at breakneck speed were Mr. Drake's blacks, heads up. Rattling the old farm wagon with its empey rigging swaying from side to side, on they came turning neither to right nor left, but dashing madly through the main thoroughfare. Men, women and children frightened by the sight and sound, hurried to the nearest place of afety. Teams of all descriptions turned out of the path. Quick as thought before anyone could grasp the situation, Orlando Fudge rushed into the street, and as the maddened horses flew past, grabbed with both hands the rear railing of the rigging, swinging his body with a tremendous effort over into the empty wagon, and crawling on his hands and knees until he could reach the reins.

"He'll be killed! He'll be killed!" the crowd cried, or held their breath in an anxious suspense. But soon was heard "Brave fellow," for with firm and steady hand he tightened the reins, bringing the frightened horses completely under his control, just in time to turn into an alley between two brick blocks not more than twelve feet apart. No one was hurt and nothing broken.

Before the enthusiastic crowd could gather and offer congratulations, Orlando was back at his post of duty, as unconcerned as though nothing unusual had happened.

The news of his adventure, pluck and coolness had spread very quickly and he soon found himself surrounded by a coterie of admiring friends.

"Well," said Mr. Thompson, a day or two following the runaway, "reckon you can manage a team all right, Fudge . Think I will put you on the two-horse delivery. You can have a helper, but everything will be in your charge for prompt and safe delivery and care of the team. All goods marked C. O. D. you must collect and render account to the bookkeeper at the desk every night; understand?"

"Yes, sir, Mr. Thompson, and I thank you, because I love to be out-of-doors. It has always been my life."

Now, John Sharp, the head clerk, looked upon these proceedings with envious disfavor. The fact was, he had never quite liked this country boy (he could not have told you why) with his plain outspoken ways, and he felt that Mr. Thompson was putting too much confiedence in him. The weeds of jealous discontent were wrangling in his brain, and he felt that he must do something to rid the establishment of the presence of what he considered an enemy.

A few weeks later complaints came in that several customers had received no credit for money paid. Their books and statements did not agree. Investigation showed a shortage of about two hundred dollars. Who had collected the money? Mr. Thompson questioned each clerk closely, with no results towards unravelling the mytery. Finally he consulted with John Sharp. "Well," said John, "I have seen a few books marked '"Pd. O. F.' That must be Orlando Fudge's way of receipting,"

"Why haven't you spoken of this before, John "

"Well, sir, I supposed you had given him permission to do so."

At this reply, Mr. Thompson looked at John, and replied: "I cannot believe that boy has stolen the money."

"But sir, how else can you account for it? I tell you he is a sly dog, and then you know the best of them will bear watching."

At this, Mr. Thompson with a heart full of sorrow, felt that Orlando must be the embezzler. Duty demanded that, if guilty, he should be punished. That night he called him to the office and told him plainly how matters stood. Orlando protested innocence.

"I haven't a cent of your money, Mr. Thompon—not one cent."

"Oh, don't talk that to me, Orlando You must have it, and if you do not make good at once, I shall be obliged to arrest you for false returns."

"All right, sir. You can arrest me, but to pay you is to admit that I took the money, and I shall not own up to theft."

Argument was useless. He would not yield, so he was arrested and locked up, pending trial. His mother, worried and anxious beyond all measure over these serious charges against her boy, came and begged him to let her pay the money, secure his release and return with her to the dear old farm, away from temptation and unjust accusation.

But Orlando said: "No mother; I am innocent of this charge. I will go to prison before I will own to a theft I did not commit."

So with tears streaming down her troubled face, and a heart bursting with love and sympathy, but loyal in her belief of her son's innocence and purity, she left him. She engaged as counsel a Mr. Williams, to defend him. Lawyer Williams felt that in view of the evidence, his chance to win the case was very slim indeed, so he advised Orlando to make a clean breast of it, admit his guilt and throw himself upon the mercy of the court for a light sentence.

"What, confess to something I did not do? Never, sir, never!" And Orlando stood before him, the embodiment of truth and young manhood.

"Well, it is up to you, Orlando. Mr. Thompson says that out of consideration for four mother, if you will confess and pay the shortage, he will go on your bond. Then by and by the prosecuting attorney will "quash" the indictment. Now it is my advice that you do this as the very best way out of your predicament, and for the relief that such a course will bring to your heart-broken mother." Then looking squarely into Orlando's face, he said: "Orlando Fudge as your attorney, I claim the privilege of telling you that you are guilty."

The words had scarcely left his lips ere he was lying flat on the cell floor. Orlando had struck him a telling blow and he had fallen. The jailer heard hts fall, and, rushing in, seized Orlando and placed him in a dungeon for safe keeping.

The whole jail was in an uproar. Mr. Williams soon regained himself, however, and the assistants advised him to try the prisoner for assault as well. But he said:

WAS TROUBLED WITH INDIGESTION

COULD KEEP NOTHING ON STOMACH.

Indigestion is one of the worst forms of stomach trouble. The stomach becomes upset and you have a raw debilitated feeling in it.

It is not necessary for you to be troubled with indigestion if you will only use that old and well-known remedy Burdock Blood Bitters, which will regulate the stomach so that you may eat what you wish without any ill after effects.

Mrs. Wm. C. Smith, Marshville, Ont., writes:—"I cannot speak too highly of Burdock Blood Bitters; it is worth its weight in gold. I was troubled with indigestion, and was so bad I could not keep anything on my stomach. A friend advised me to try B.B.B. which I did, and I never felt better in my life."

Burdock Blood Bitters has been manufactured by The T. Milburn Co., Limited, Toronto, Ont., for over 40 years. You do not experiment when you buy it.

"No. that boy is innocent and I will clear him. I insulted him and he resented it. There is a terrible mistake here somewhere. Had he been guilty, he would have hung his head in shame."

A chorus of voices exclaimed:

"Yes, it looks like it when he knocks down his attorney. Oh, he's a bad 'un, Mr. Williams; a bad 'un."

"You leave that to me," replied Mr. Williams, and going at once to Mr. Thompson's store, he obtained the names of every patron whose books showed money paid and receipted "O. F." He secured a postponement of the case. He summoned everyone who held uch books into court the following morning. Not a word had passed between him and the prisoner.

When Orland was brought to the dock, he expected to be found guilty of both theft and assault. The prosecuting attorney stated the case and said that as the evidence was overwhelming he should ask the court to find the prisoner guilty before the law and that he be sentenced to jail for one year and to pay a fine of three hundred dollars.

As soon as Mr. Williams could answer he threw a thunderbolt into the courtroom by demanding the release of the prisoner. Calling on Mrs. B—— as a witness. he put the question:

To whom did you pay the last credit on your pass book?"

"To John Sharp," was the reply.

"Did you examine the book to see how it was receipted?"

"No, I supposed it was all right, as I have paid hi mbefore."

"Have you ever paid money to the prisoner?"

"Never but once. Then I orIdered the goods sent to me .C O. D."

After examining two or three more witnesses. an dthey all swore that they never paid Orlando Fudge, except for such goods as were sent C. O. D.. Mr. Willamis, addressing the court. said:

"May it please your honor, I have a dozen witnesses here, all ready to tetify that they never paid the prisoner one cent on their books, but that John Sharp collected the money and receipted 'Pd.. O. F.' Shall I proceed "

"No. that is sufficient."

"Then," sad iMr. Williams, "I demand that John Sharp be arrested as the real embezzler."

John Sharp was arrested. He was caught in his unprnicipled trick to undo his companion. His jealousy had worked his destruction. "The way of the trangresor is hard."

John Sharp went to jail. carrying a consciousness of his own downfall.

Orlando Fudge returned to Mr. Thompson's store, a faithful clerk. with no shadow of dishonesty surrounding him. He had been tried and found true, and is today the owner of a large wholesale house and doing a flourishing business. The old farm has been reclaimed. the house remodelled and beautified; the birds never sang sweeter than there on a May morning.

It has become a mecca for Orlando's numerous friends. for he is a man of the world today, respected by all who know him.

Mr. Thompson. Lawyer Williams and Orlando Fudge form a trio of boon companions. often wandering in the fields or trolling the trout brook together; and to the eyes of his aged mother, Orlando is a jewel, brighter and more lumininous than any star that decks the diadem of a king.

DAVID HAROLD JUDD.

Luncheon Dish.

2 c. dried bread crumbs, 1 c. chopped cold potatoes, 1 small minced onion, ¼ tsp. each, salt, pepper, sage.

Mix thoroughly, moisten very lightly with milk. Melt 2 tbsp. drippings in a frying pan and when hot turn in the crumbs and toss lightly with a fork. Cover closely and brown over a slow fire without stirring. Turn out and serve at once.

Oatmeal Muffins.

1 c. cooked oatmeal, ½ c. milk, 2 tbsp. sugar, ½ tsp. salt, 4 tsp. B. P., 1½ c. flour, 1 egg, 2 tbsp. melted butter.

Mix and sift flour, sugar, salt and B. P. Add half the milk and the egg well beaten. Mix the remainder of the milk with the oatmeal and add to dry ingredients. Beat thoroughly and add melted butter. Bake in muffin tins.

Crumb Cake

1 c. brown sugar, 1 tsp. cloves, 4 tbsp. butter, 1 tsp. cinnamon, 1 tsp. soda, 1 c. buttermilk, 1¾ tsp. soda.

Mix butter, flour and sugar together until it crumbs and take out ¼ to sprinkle over cake batter just before putting into oven. Mix the other ingredients together, sprinkle with crumbs and bake in moderate oven.

Potato Scones

Moisten cold mashed potatoes with milk or cream, then work in 1 tsp. B. P. and sufficient flour to make a stiff dough. Roll out, sprinkle with flour, cut into rounds and cover with beaten egg. Dip in flour and bake on hot griddle.

Take Your Time

NEVER buy a cream separator in a hurry. Your reason for buying is not so much to get a cream separator, as to get all the cream from your milk, all the time. It takes time to pick that kind of a machine out of the many on the market.

Send to reputable firms for catalogues, and study them carefully. See which machine requires the fewest and simplest adjustments; which has the best oiling system; which is most sanitary and most easily cleaned· which is so well made that it will undoubtedly do good work for a long time. Go into details, and pick the best two or three of the lot.

Then ask for skimming demonstrations to determine how little cream is left in the skim milk. This is important, because the wrong machine can waste more cream than it is worth, while the right one will put money in your pocket every time you use it.

When you are through you will find that you have bought a **Lily Cream Separator** because the **Lily** will prove to be first on all these counts. We will send catalogues on request, leaving the final decision to your judgment. Write to the nearest branch house.

RHEUMATISM

Needs Strong Medicine Decided Syracuse Man Who Suffered 36 Years Before, at Last He Found A Cure.

WILL SEND FREE TO ALL WHO SUFFER

"You can't cure Rheumatism with liniments, cheap uric acid solvents, starving, sweating or dosing your stomach with drugs that either ruin the digestion or are so weak they do little more than scratch the surface of the disease," says F. H. Delano of Syracuse, N. Y. Rheumatism is deep-seated, hard to shake off for good as everyone who suffers from it knows, and it needs medicine which, while harmless to the stomach, is strong enough to take right hold to do any permanent good.

Mr. Delano who suffered from all the torturing, twisting pains of rheumatism for 36 years, found at last, a strong but harmless medicine compound that cured him. As he took it, all those years of accumulated soreness, pain and stiffness just seemed to melt away and vanish. THIS REMEDY IS WORTH TRYING. If you suffer from rheumatism, let Mr. F. H. Delano send you a generous package of his great medicine FREE. Don't send any money. He wants to give a package free to every one who needs it. Don't suffer another day from rheumatism if this package will end it, but write at once to F. H. Delano, 787-C, Syracuse, N. Y., and get your package right away. Because of the great expense, not more than one free package can be sent to an address.

FOOD VALUES

Dr. Oliver Wendell Holmes, of blessed memory, once wrote: "The practice of medicine consists largely in putting drugs of which we know little into the human stomach of which we know less," This of course, an epigram, and while it is unfortunately to some extent true, that it is very much less true now than when the genial doctor penned it.

While it must be admitted that medicine is far from an exact science, there are certain departments of medical knowledge which approach exactitude. Such are anatomy, chemistry, and to a lesser degree the physology of food assimilation. With a normal digestion the choice of food is usually left to habit. For instance, I have made shredded wheat biscuit a breakfast for so many years that I feel lost without it—apropos of which a friend once sent me the following from Limerick:

"I never ate an old straw hat.
I never mean to eat one;
But if I do 'twill be a real
And not a shredded wheat one."

Now I trust you will pardon me if to make plain the point I wsh to emi phasize. I grow technical and "talk shop for a little.

Scientists measure food values by the heat unit or calorie, of which one-half pint milk contains about 140, one egg 80 and one-fourth pound tenderloin steak about 300. It has also been determined by experiment how many units per day the human system requires to maintain health under differing conditions. A man of average weight, if at rest, needs 2000 calories per day; with moderate labor 2500, and with hard labor 3000 to 4000.

All this is helpful, but certain other facts are needed to estimate the real value of a given diet. Generally speaking, foods contain three ingredents as the source of ther caloric value—proteids, fats and carbohydients. While the proportion dffers largely in different foods, the meat foods are usually taken as representing the proteids, and starchy the carbohydrates. As a rule it is the digestion of proteids that gives most trouble to the consumer—and incidentally the most business for the doctor.

It has long been a cherished belief among both laymen and physicians that the so-called red meats were bad for rheumatism because they "made uric acid in the system." The relation of uric acid to rheumatism has been denied by some recent writers, and may be regarded as unsettled. (Some peoplt you know, insist upon amending the decalog to suit their notions.) But the fact does rtmain that the digestion of proteids is accompanied by the production in the system of what are termed "purin bodies," of which uric acid may be taken as a type.

Now, whether or not these purin bodies produce rheumatism, is not essential for our purpose today. If they don't do that, they do other things enough in disturbing the internal economy to put them in the class of undesirable citizens. Furthermore, while they exist more or less in most proteids, they are much more abundant in the proteids of the red meats than in those of poultry, fish, eggs and milk.

Now, if you will regard the above as a sermon, this is the application: It would make for health with the average person if a large part of the beef and pork consumed was replaced by some of the other meat foods, particularly poultry and fish, to which may be added eggs and milk. With these one can get an ample supply of proteids and get them in a form to be more easily and fully digested with a much smaller amount of the objectionable purin bodies as a by-product.

While this applies in a general way to all healthy persons in whatever employment ,it applies with added force to such as are less active or sedentary in habits, and in whom the digestive processes and metabolism are slower and less complete.

Another important thought in this connection is this: It is well known that in cases of chronic kidney trouble the doctor's first advice is to cut out meat foods. This is because the elimination of waste material from proteid foods falls largely upon the kidneys, and when overworked, like any other organ, they "give out." Many lives would be saved for years of usefulness if people would provide against this condition of kidney failure by cutting down the meat supply, or by substituting in part the more easily digested kinds—poultry, eggs and fish.

Speak Of Them in The Highest Terms

WHY MR. AND MRS. WEST RECOMMEND DODD'S KIDNEY PILLS

They Cured Mr. West's Lumbago and Made Mrs. West Feel Like a New Person. They Are the Best Tonic.

St. James, Man., April 7th, (Special) —That Dodd's Kidney Pills are living up to their great reputation in the West is twice proved by Mr. and Mrs. G. West, well known and highly respected residents of this place. Let Mrs. West tell the story of what the great Canadian kidney remedy has done for her husband and herself.

"My husband suffered from attacks of lumbago," she states, " and the doctor did him no good, but I can truthfully say that since using Dodd's Kidney Pills he is entirely free from lumbago.

"I myself took six boxes of Dodd's Kidney Pills and am just like a new person. I have gained 10 lbs. since using them and my friends compliment me on how well I look.

"I have recommended Dodd's Kidney Pills to some of my lady friiends who were complaining of not feeling well, and they, like myself, speak highly of them."

Dodd's Kidney Pills cure the kidneys. Cured kidneys make pure blood. That is why Dodd's Kidney Pills are the best tonic.

THE PROPER USE OF KITCHEN TOWELS

There is some excuse, and a pretty good excuse for not drying dshes at all, but there is no excuse for drying them on soiled dish towels. Sometimes women who are extremely fastidious about their preparatoin of food and who would not for the world use their fingers in handling food, make a practice of drying dishes on towels that are not perfectly fresh

I KNOW A WOMAN'S SUFFERINGS

I am a woman.

What I have suffered is a far better guide than any MAN'S experience gained secoudnaud.

I know your need for sympathy and health.

And the treatment that gave me health and strength, new interest in life, I want to pass on to you, that you, too, may enjoy the priceless boou of health.

Are you unhappy, unfit for your duties? Write and tell me how you feel and I will send you ten days' FREE trial of a home treatmeut to meet your individual needs, together with references to women in Canada who have passed through your troubles and regained health; or you can secure this FREE treatment for your daughter, sister or mother.

If you suffer from pain in the head, back, or bowels, feeling of weight and dragging down sensations, falling or displacement of internal organs, bladder irritation with frequent urination, obstinate constipation or piles, pain in the sides regularly or irregularly, bloating, dyspepsia, extreme nervousness, depressed spirits, melancholy, desire to cry, fear of somethiug evil about to happen, creepiug feeling up the spine, palpitation, hot flashes, weariness, sallow complexion, with dark circles under the eyes, pain in the left breast or a general feeling that life is not worth living, I invite you to send to-day for my complete ten days' treatment entirely free and postpaid, to prove to yourself that these ailments can be easily and surely overcome at your own home. without the expense of hospital treatment, or the dangers of an operation. Women everywhere are escaping the surgeon's knife by knowing of my simple method of home treatment, and when you have been benefited, my sister, I shall only ask you to pass the good word along to some other sufferer. My home treatment is for all,—young or old.

MRS. M. SUMMERS, Box 309

Read My FREE Offer:

To Mothers of Daughters, I will explain a simple home treatmeut which speedily and effectually dispels green-sickness (chlorosis). irregularities, headaches and lassitude in youug women, and restores them to plumpness and health. Tell me if you are worried about your daughter. Remember it costs you nothing to give my method of home treatment a complete ten day- trial, and if you wish to continue, it costs only a few cents a week to do so, and it does not interfere with one's daily work. Is health worth asking for? Write for the free treatment suited to your needs, and I will send it in plain wrapper by return mail. Cut out this offer, mark the places that tell your feelings, and return to me. Write and ask for the free treatment to-day, as you may not see this offer again. Address:

Pathé

Vocal Records that Stand Supreme

IN the making of Pathe' Vocal Records, by a recording process used only by Pathe', every note, big or little, every delicate nuance, every breath, tone or expression of the artist is faithfully caught and inscribed.

The Pathe groove in which the minute sound waves are recorded is from two to four times as large as in any other record. This big groove enables Pathe' to get 40% more tone colors and detail. Compare these records with other makes in the same class. Study the detail, the tone quality, the true naturalness of the voice, the orchestral accompaniment, always in perfect sympathy, yet note how voice and instrument each stand out clear and distinct right through to the end. The satisfying completeness of a Pathe' vocal record leaves nothing to be desired.

The Pathe' repertoire includes records by the foremost artists of the world, and will prove a revelation to the critical lover of the exceptional in music.

While to hear Pathe' records at their best, they should be played on the Pathephone, yet if you already have a machine of another make, any Pathe' agent can equip it to play Pathe' records—or, better still—will make you a liberal allowance for your machine in part payment of a Pathephone, which plays any record.

H. L. HEWSON & SONS, LTD., Amherst, N. S. 21

They have been used for the previous meal and have since then been about the kitchen, been used possibly to lift up a hot dish and maybe to sop up a little overturned water on the dining room table. And, after all, we use them to dry dishes. It is an interesting case of straining at a gnat and swallowing a camel.

Here are some directions you ought to follow if you would put yourself out of the class of dishcloth misusers:

Wash dish towels whenever soiled with hot water and soap and rinse them thoroughly. This means after every meat at which they have been ued. Two towels is enough to dry dishes for a very small family. If you have ix towels in use then you will have to wash them but once a day Have a special place to keep them when they have become soiled. If you have an ample supply you need not wash them at all, but may send them to the laundry with the other clothes.

When you hang towels to dry fold them lengthwise, with the ends pulled evenly together. They dry just as quickly in this way and it obviates the necessity of having to iron them, and makes them take up less room on the drying bars.

When the cloths have become stained and yellow wash them in ammonia and water.

Never use dishcloths for stove cloths. Have special heavy cloths for that purpose. Do not use soiled dish towels for the purpose of sopping up liquids that spill in preparation of food. Have a moist dishcloth always at hand for this purpose to keep the work table free from soil.

Rye Muffins

1½ c. rye flour, ½ tsp. salt, 1 c. milk, 4 tsp. B. P., 1 egg, ½ c. wheat flour, 1 tbsp. butter, melted.

Mix and sift dry ingredients, add beaten egg and milk and lastly melted butter.

Nut Stuffed Potatoes.

6 potatoes, 1 tbsp. butter, ½ c. ground nuts, salt, 2 tbsp. cream, pepper.

Bake potatoes, when done scoop out inside, being careful not to break skin much, mash potatoes, add nuts, cream and seasonings. Beat with fork until light. Refill skins and brown in oven.

Bran Gems.

1 c. bran, 1 c. milk, 1 tsp. salt, 4 tsp. B. P., ¼ c. sugar, 1 c. white flour, 1 egg, 1 tbsp. shortening, melted.

Mix and sift dry ingredients, add sugar, milk and well beaten egg and melted shortening. Bake in muffin tins.

Oriental Salad

Put dates through food chopper, add a pinch of ground cloves and shape mixture into small balls. Roll in grated cheese until thickly coated. Serve on shredded lettuce and mash with salad dressing.

Boiled Salad Dressing

½ tsp. salt, 1 tsp. mustard, cayenne, 1 tbsp. sugar, 1 egg or yolks of two, 1 tbsp. butter, ½ c. hot water, ¼ c. vinegar, 1½ tbsp. flour.

Mix dry ingredients, add egg slightly beaten, water, and vinegar. Cook until mixture thickens, add butter. This may be thinned with cream.

Make-the-most-of-it-Biscuit.

2 c. flour, ½ tsp. salt, ½ tsp. soda, 2 tbsp. shortening, 1 c. sour milk.

Mix and sift dry ingredients, work in butter, add sour milk, stir very lightly, making a soft dough. Bake in muffin tins 20 min. in hot oven. about 20 min. in quick oven.

Sallies

1 c. molasses, 1 c. shortening, 2 tsp. soda, 1 c. sugar, 1 c. buttermilk, flour, spices.

Cream butter and sugar and molasses, mixed and sifted dry ingredients alternately with milk. Mix as soft as can be handled. Roll out about ½ in. thick and cut with round cutter.

NAME .....

ADDRESS .....

REAL IRISH STEW

First peel and boil six large, or 12 small onions, for a quarter of an hour, and throw away the water; then boil three pounds of peeled potatoes for a quarter of an hour, and throw away the water also. While the potatoes are doing, cut a breast of mutton into thick slices, and your onions into thin slices, and cut your potatoes into thick slices when done. Put into a sauce-pan, first, a layer of onions, next a layer of potatoes, then a layer of meat, and afterwards a little salt and pepper; then again another layer of onions, a layer of potatoes, then a layer of meat, with salt and pepper, and so on, till all is in the stew pan. Put in three quarters of a pint of cold water, cover it quite close, and let it simmer very slowly, for three hours. In order to make this stew in perfection, you must do it over a very gentle fire, in a sweet earthenware pan, closely covered, to keep in steam. Or it may be baked, closely covered, in a slack oven for the same time. Serve it all up in one dish.

HONEY A SUGAR SUBSTITUTE

Honey is much more easily digested than sugar and much more quickly assimilated. It has the peculiarity of retaining moisture, keeping bread and cakes, for instance, fresh and soft for a long time. It is delicious on dry cereals of all kinds, even dry bran. In combination with most fresh fruits and nuts, there is no sweet like honey. Try it with baked apples, baked peaches, sour cherries, boiled or baked quinces, grape-fruit, cocoanut, almonds and Brazil nuts, and you will surely want it a second time. Raisins, spices and spicy seeds blend well with honey.

Honey cakes, as we have said, are noted for their keeping qualities. For this reason, the use of honey is recommended for wedding or black fruit cake, while it gives a richness to flavor and texture to even a plain raisin loaf.

Remember, anything sweetened with honey burns quicker than if sugar is used.

TO SHRINK WOOLENS

To shrink woolens wet a sheet and spread it over the table. Place one thickness of the goods lengthwise of the sheet, and roll sheet and material together. In the morning unroll and press the goods with a hot iron.

The teeth should be brushed at the morning toilet, after each meal, and again carfully at night, just before retiring, because of the presence of decomposing matter which has a longer time during the hours of sleep in which to set up a process of decay.

I have heard men in family prayer confess their wickedness, and pray that God would forgive them the sins that they got from Adam; but I do not know that I ever heard a father in family prayer confess that he had a bad temper. I never heard a mother confess in family prayer that she was irritable and snappish. The angels would not know what to do with a prayer that began: "Lord, Thou knowest that I am a scold."—Sermon: "Peaceableness."—Henry Ward Beecher.

Pain in Shoulders
PAIN IN HEAD
LIVER BOTHERED HER.

Miss A. Windsor, Peterboro, Ont., writes:—"I have been sick for about four years with pains in my head and pains in my shoulders which I always thought were caused by working outside in the sun on the farm.

People told me that it was my liver bothering me, so I bought three vials of Milburn's Laxa-Liver Pills, and found that they were doing me good. I continued taking them until now I am well and strong. I am very thankful to you for my recovery."

Milburn's Laxa-Liver Pills are a specific for all troubles arising from a morbid state of the liver, so keep it active by the use of these easy-acting, non-irritating little pills.

Milburn's Laxa-Liver Pills are 25c. a vial at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

THE BAD HABIT OF FATIGUE.

Oftentimes one can look back and discover what, in the first place, was the real cause of the fatigue which has settled down upon one and become chronic.

Now, there is such a thing as the fatigue habit, just as there are other bad habits—the habits of losing one's temper, of fault-finding, of taking the easiest way, of being curious, et cetera.

If one is sure that fatigue is not due to genuine physical causes—a digestive system that is not working well and taking thorough care of the body waste, or to overstrain from too much work or unfavorable surroundings—then it is well to have a day of reckoning, in order to decide whether the tiredness is the result of an acquired habit.

The acquisition of a bad habit is easy and swift. Once started you get to the bottom of its badness before you know you are there.

Now what do you suppose has most to do with making the descent so swift? It is that great power behind the throne of habit, an IDEA. And what do you suppose an idea is? Well, it is an act making up its mind to be born.

It Starts as an Idea.

Then it is rather important, is it not, to have the right sort of thoughts? All the more so, since, frequently, these ideas do not seem to be particular about asking leave to be born.

There is a vast deal of force in that little thought that pops into one's head, often uninvited, from goodness knows where.

It's power is almost endless, but there is one way of using it of which we seldom think; turning it in upon ourselves, reversing our ideas, telling ourselves that we are not tired, not silly, not weak-kneed.

We hear much about housecleaning, street-cleaning, civic cleaning, but what about a housecleaning time for ideas, thoughts and habits—in short, mental hygiene and sanitation, cataloguing and filing and stock-taking—which will end in the summary ejection of unclean or vicious thoughts, silliness, false ideals or useless and bad habits?

The moments of half-sleeping and waking at night-time and in the morning are the most important in all the twenty-four hours. They are fallow field for whatever crops you will sow and raise, whether of joy or depression, courage or cowardice, wisdom or folly, vigor or fatigue.

You went to bed that first night afraid that you were too tired to sleep. You repeated the fear a second night and followed it at intervals by a fifth, sixth, seventh, eighth time. The cowardice or folly is established.

On that first night the bad HABIT was begun. The mistake repeated, the bad habit became more firmly rooted.

Gradually the fear that you could not sleep, the idea that you were too tired, ceased to be an exception and

PEERLESS LONG SPAN GATES

THE gate pictured below is a companion to the Peerless Perfection farm fencing, strong, durable, with heavy tubular brace, which stiffens it like a steel bridge. It swings true and rigid as an oak door hung by a master mechanic. Lateral and upright wires securely clasped at all intersections and stretched upon a strong rigid frame of tubular steel electrically welded into one solid piece.

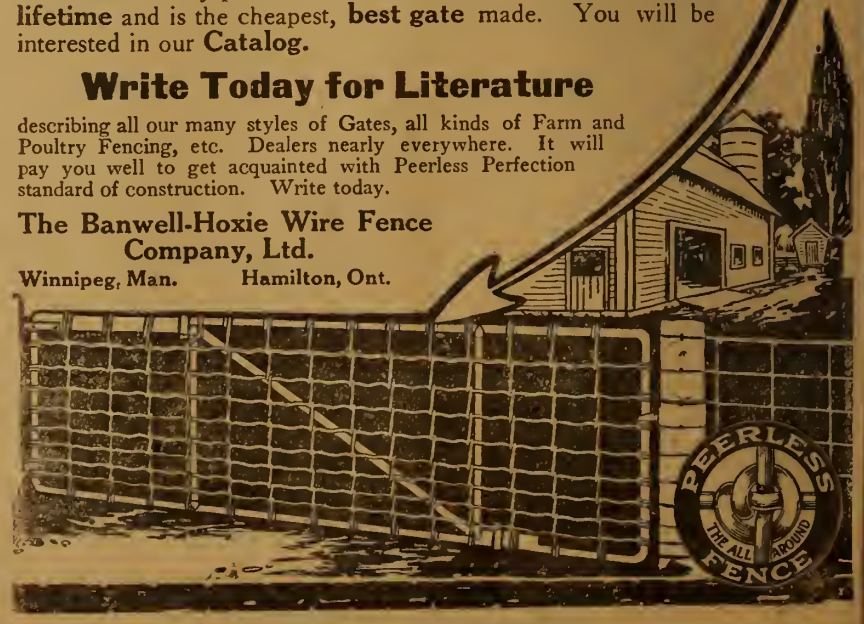
FOR LOOKS, WEAR AND SERVICE

In appearance a Peerless Gate says: **"I am guardian here."** For durability it is of heavy open hearth steel wire, galvanized and **can't rust** at any point. For service it is put together to last a **lifetime** and is the cheapest, **best gate** made. You will be interested in our **Catalog.**

Write Today for Literature

describing all our many styles of Gates, all kinds of Farm and Poultry Fencing, etc. Dealers nearly everywhere. It will pay you well to get acquainted with Peerless Perfection standard of construction. Write today.

The Banwell-Hoxie Wire Fence Company, Ltd.
Winnipeg, Man. **Hamilton, Ont.**



became the rule.

To an astounding extent are we what our thoughts make us. You might sleep forever, but if you slept with the idea of being fatigued, with mathematical certainty would you wake fatigued and not refreshed. Now, without any effort on your part this little tragic-comedy of one act, two acts, three acts,—miserable wakefulness, complaining, exhaustion—r epeats itself, takes place spontaneously every night and becomes a habit.

By this time, too, habit has scrawled not only a line upon your brain, but also lines upon your face. It finds expression in dropping shoulders, listless walk and general weakness of the will. From having been attractive, your faec has ceased to be interesting or winsome any longer, your very personality has lost charm and magnetism for others. What is worse, the fatigue, which was part imagination and part fear, has become genuine enough and you are really tired.

In the words of the comic opera "Here's a pretty howdy-do" for any self-respecting girl or woman. If she is to get back her lost self-control and attractiveness, conditions must be wholly reversed.

Ideas of rest, vigor and cheerfulness must be affirmed and maintained. Gradually, because the best in us is long-suffering and almost ineradicable, the vitality which remains answers the summons and the process of driving out the enemy-chronic and imaginary fatigue—begins. tI cannot begin too soon.

Obstacles will present themselves to the recovery of buoyancy. Down with these. The will has grown weak in the hothouse of long-continued weariness, and trifles will magnify themselves, some of the difficulties seeming insurmountable.

Grapple with them. Don't hesitate. Toss them out head over heels.

Only You can Overcome it.

Remember, it was partly your imagination that brought upon you the miserable habit of tiredness and made you in the end really ill. Its power must now be reversed until it has restored vigor and health and brought happiness with it.

Simply to assure yourself that you are not tired is one of the best first steps to take.

You want to be vigorous, fresh, dynamic. It will mean love, friends, happiness, success, health—it will mean everything for you to be so. Very well, then, walk and move as if you were vigorous, speak as if you were, act as if you were. Forget the devitalizing habit that has possession of you. Never discuss it with anyone. Never speak of it again. If it pops into your mind. throw it out promptly. One's body, made up, among other things, of bundles of nerves and muscles obedient to these nerves, is not stupid. This surprising message of freshness and vigor, this new attitude, will be quickly carried to all the nerve "centrals" throughout the body and repeated and repeated and repeated, until what was "news" at first becomes daily fact. And under the wholesome message, the body straightened up, physical functions get back their strength, lines vanish from the face, and one's organism strives for and achieves new levels of will-power, self-control ,health and joy in life.

Barley Drop Cakes

¼ c. shortening, ½ c. molasses, ½ c. sour milk, 1 c. barley flour, ½ tsp. salt, ½ tsp. cinnamon, ¼ c. sugar, 1 egg, 1 cup wheat flour, 1 tsp. soda, 1 tsp. ginger.

Cream butter and sugar, add beaten egg, molasses and milk, mixed and sifted dry ingredients. Drop on buttered sheet. Bake in quick oven.

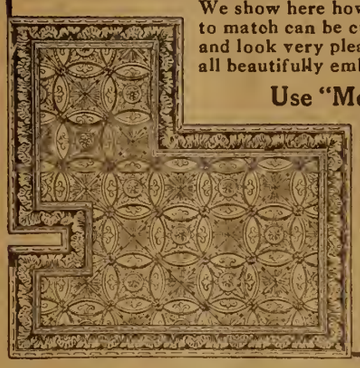
Japanese Salad.

2 c. boiled rice, ½ c. nuts, 1 green pepper, ½ c. celery, 1 tart apple, 1 small onion.

Chop apple, nuts, pepper and onion, mix with rice and salad dressing.

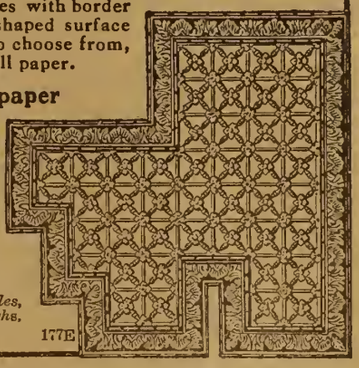
"Metallic" is beautiful for walls and ceilings

Any shaped wall or ceiling can be tastefully covered



We show here how two of our most artistic and popular plates with border to match can be cut and notched if necessary to suit an odd shaped surface and look very pleasing. We have dozens of modern designs to choose from, all beautifully embossed and actually easier to put on than wall paper.

Use "Metallic" instead of lath, plaster and paper



"Metallic" steel plates never sag or crack or get torn off, they can be painted or washed, and they are fire proof, sanitary, economical and once put up are there to stay. Have you any old or broken plaster ceilings, or are you putting up a new home? Let us send you our illustrated folders on "Metallic" the handsomest and most durable of all wall and ceiling coverings. You'll have a splendid choice.

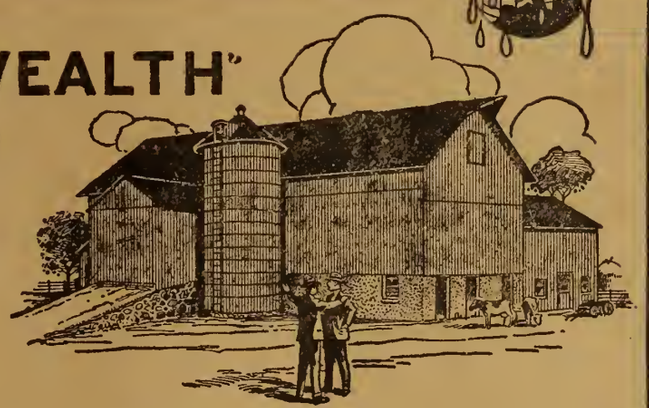
M-S COVER THE EARTH

"COMMONWEALTH" BARN RED



The Paint for Barns, Roofs, Fences, Etc.

S-W COMMONWEALTH BARN RED is a bright, rich Red, that works easily, covers well and dries with a fine, smooth, durable finish. Put up in convenient sized cans, all full Imperial Measure. Why not try it this year to protect your barn against the weather ?

You have a heavy investment in farm machinery, implements, wagons, etc. Increase their life and usefulness by protecting them against rust and decay, by using *SHERWIN-WILLIAMS WAGON AND IMPLEMENT PAINT*. The longer they last the less they cost.

It is economy to use *S-W BUGGY PAINT* on your buggies and carriages, and *S-W AUTO ENAMEL* on your car. They give entire satisfaction and are easy to apply.

Color schemes and suggestions for any part of your building furnished by expert decorators, free upon application and without any obligation.

Send for our book:—"The A.B.C. of Home Painting" written by a practical painter, telling how to paint, varnish or enamel every surface in and around your home.

KINGS COUNTY SEED FAIR

The fifteenth annual Kings County Seed Fair under the auspices of the Sussex and Studholm Agricultural Society was held in the basement of the Agricultural School. Sussex, on Thursday, March 28th.

Despite the unfavorable crop conditions of last summer the seed grain exhibited at the Fair was well up to the standard of former years.

There was a big display of oats. Some samples of which were somewhat off color but otherwise very good in quality.

The bean display was the best ever made at a Sussex Seed Fair.

Wheat and buckwheat exhibits were of excellent quality.

The turnips for seed growing section was well filled. The potato sections were not quite as extenoively filled as they were last year.

Several young men were on hand with exhibits for the first time. The interest they evidenced in the proceedings is a good omen for future seed fairs, and means that some of the older exhibitors must look well to their laurels.

Dark horses won the race in the rough buckwheat and smooth buckwheat classes. These same exhibitors will likely come back with bigger and beter entries next year.

It takes quality goods to win at the Sussex Seed Fair.

See a full list of the prize winners.

C. F. Alward, Havelock and W. H. Moore, Scotch Lake, placed the awards in the absence of S. J. Moore, Maritime Representative of the Seed Division, who was called to Quebec last week on important business in connection with the procuring of seed grain to fill the demand that is so pressing in the Maritime Provinces.

A general meetin gof the Agricultural Society was held in the afternoon at 2.30 o'clock. J. T. Prescott occupied the chair. There was a good representation of the members present. Several subjects were discussed. The Seed Fair judge gave short addresses on the fair in general. R. P. Steeves spoke on the subject of Agricultural Education in our Schools. J. E. McAuley expressed himself on the good work done in his locality last fall by the Government. Clover Huller and urged upon all present to plan and prepare to take advantage of the use of this machine next fall by reserving some clover hay for seed. Mr. McAuley threshed 400 pounds of clover seed last fall and with clover seed selling from 30 to 50 cents per pound it will readily be seen that he was well repaid for his labors.

Owing to the urgency of the calls that are being sent out to our farmers by the Department of Agriculture on the representations of the Food Board is was unanimously decided that the Society members must meet on the last Saturday of each month at 2.30 p. m. to assist in passing the word olong and discuss the various problems that may be presented. The sum of $50.00 was voted to the Allies Relief Fund.

H. R. McMonagle acted as auctioneer and the first prize samples of seed grain were disposed of at good figures to the highest bidders.

The Seed Fair of 1918 was a success in every respect.

DEDICATE AND PREPARE FOR

Greater Food Production

Every One's Duty. Give One Week to Preparation for the Spring Crop Drive

PLAN EARLY! BE READY!

A SPECIAL Proclamation by His Honor the Lieutenant-Governor has been made to all County Councils to convene an extraordinary meeting to discuss ways to increase Food Production.

ALL CLERGYMEN to proclaim from their pulpits on April 14th the terrible truths of the 1918 food situation.

ALL CITIZENS to co-operate loyally in the sacred cause of producing more Food this year.

THE CRISIS IS WITH US—THE TIME OF SOWING IS AT HAND—THE RESPONSIBILITY UPON NEW BRUNSWICK IS GREAT.

SUGGESTIONS.

PLANS—

(1) Arrange definitely crop rotations.
(2) Secure seed early.
(3) Where possible arrange to co-operate with neighbors in the seeding season. Change work.
(4) Prepare to remain on farm every day after seeding commences until the seed is sown—Transact all necessary business now.

EQUIPMENT—

(1) Carefully overhaul all harness.
(2) Put all machines and implements into shape.
(3) Procure the most needed repairs—Secure a few extra.
(4) Have all tools, such as axes, saws, hammers and wrenches, ready and conveniently placed.

SEED—

(1) Reclean seed unless it is satisfactory.
(2) Treat oats for smut.
Add 1 pint Formalin to 36 gallons of water. One gallon of this mixture will treat about two bushels of grain.
(3) Treat potatoes for scab.
(4) Have seed prepared before Spring operations commence.

FERTILIZERS—

(1) Procure them early—The supply is very limited.
(2) Have you used more than necessary in past seasons? Plan to use more green manures.

CROPS—

(1) If your land is suitable for wheat sow a few acres; if not, arrange in order that some cereal will be grown.
(2) Food, not dollars, is the great essential—Use your land so that your country and also that you may feel the best possible use has been made of every acre.

CONSIDER WHAT MAY HAPPEN IF AMERICA FALLS SHORT IN CROP PRODUCTION IN 1918!

NEW BRUNSWICK IS EXPECTED TO DO ITS DUTY IN THIS HOUR OF CRISIS.

J. F. TWEEDDALE,
Minister of Agriculture of New Brunswick.

THE PRIZE WINNERS

Wheat, White or Red Fife—7 entries
1—W. H. Venning; 2—A. W. Raymond, Lower Millstream; 3—Bert Tamlyn, Sussex; 4—W. E. Wallace Penobsquis.

Wheat, any other variety—6 entries
1—W. A. Venning; 2—Bert Tamlyn 3—T. A. Davis, Sussex; 4—H. B. Pa

Who chose the Friction Pulley on your Engine?

90% of the Friction Pulleys sold with Gas Engines are not manufactured by the makers of the engine. When you buy an Engine equipped with Friction Pulley you have your choice of Engine, but someone else choice of Pulley When buying make certain of satisfaction—choose the pulley yourself—specify, or order direct. Bernard's Double Friction Pulley.

Is Gold Dust helping *you*?

IF YOU take dishwashing for granted, then take Gold Dust for granted, too.

Gold Dust doesn't turn dishwashing into a real joy, but it does dissolve grease pleasantly and much quicker than soap.

Dishes washed in water softened with Gold Dust, are spotlessly, brilliantly clean.

Another thing you can take for granted is that Gold Dust, when used for washing dishes, saves many precious minutes every day.

Doesn't this time-saving quality of Gold Dust appeal to you?

Gold Dust saves time, too, in many other ways. Keep the ice-box sweet and sanitary with it; the floors and woodwork cheerfully clean; the bathtub immaculate.

And be sure it really *is* Gold Dust that you use. Your grocer can sell you Gold Dust in large and small packages.

PRESIDENT BAIRD'S ADDRESS BEFORE THE N. B. F. & D. A.

(Continued from page 379)

back and watch the young man to see if he will respond to the call to arms. We have had our opinion and perhaps expressed it, in regard to the duty of the young man in the face of such a call. The young man is now watching us. Some of those who are maimed and scarred and crippled for life are watching us. The call for food and for money new is more urgent and pressing than the call for men was when they enlisted. This call for food is the question of the day. It is a smple imatter to give money—if we have the money and have the heart to give it. But producing more food is not a simple matter—it is a problem and it is a problem for us to solve. If the Farmer does not rise to the occasion, then the plans and the efforts of the Government will be unavailing. Our oppurtunity to sacrifice something has come. We are being "weighed in the balance." If we are to be worthy of the respect of those who have risked their lives for us and of the relatives of those who have died in the fight to preserve our freedom—we must do better. We can produce more—we ought to do it. That settles it—we shall. Does anyone say no?

But while it is a testing time, a time that calls for the opening of our hearts and our purses, I repeat that it is also a time of great opportunity. The dignity and importance of our calling is now recognized as of National value.. perhaps more than that of any other occupation in civil life. Our Government is leading off in many lines in an effort to asstist and co-operate with us in an endeavor to increase production and develop the agricultural resources of our land. I believe that they are hampered in their efforts because the farmers are not asking for more.

At a meeting called last spring in this city with a view to increased production it was very evident that the "Powers that be" wished to hear from the farmers themselves just what they wanted in order that the desired result might be obtained. The farmers were hardly prepared to say what they wanted.

A better opportunity is given during this session of the convention because a letter has been sent (I presume) to all Agricultural Societies suggesting that any matter of vital importance and general interest to that district can be brought before this Association by having a resolution placed in the hands of the resolution committee early in the session.

We ought not to forget, while we are here in session that the findings of this Association usually receive favorable conideration and it therefore becomes us, if we have any requests to make or suggestions to offer to the Department of Agriculutre or Legislature in general, to take advantage of this oportunity.

Perhaps I might make a suggestion in regard to the only other Provincial organization we have. I refer to the N. B. Agricultural Societies United. I think we may call it a child of this Association. So far as I know it is the only regular authorized purchasing agency for the Agricultural Societies. At present the Act of incorporation only covers, "Fertilizer ingredients." It has however, this clause, "and when authorized by order-in-Council of the Lieutenant-Governor-Council to undertake to carry on any other work or business which may be of advantage to the farming industry." I hope you may see fit to take some action on this matter as I believe that organization ought to be doing a lot more co-operative purchasing than it is at present. It has done good work for the Agricultural Societies that have taken advantage of the privileges it offered and has done more in the Society to which I belong to increase the membership and develop the spirit of co-operative purchasing than any of us would have believed possible before we tried it.

What about the past year? In regard to dairying, crops, prices, etc., I have no doubt the reports of the County Vice-Presidents will fully cover these subjects so that we may make only a few observations. I think on the whole we were somewhat disappointed at harvest time. Neither the grain or potatoes were as good as they promised to be earlier in the season, in many cases quite a serious failure. Why? Mainly unfavorable climatic conditions, but not altogether that. Most of us depend too much on Providence for a good crop. We leave too much for Providence to do. We forget that growing crops is a partnership business. That God is the great, silent, senior member of the firm. That He has established laws to be observed if success is to be expected. Some years we violatet those laws and yet have good crops. Judgment against an evil work is not always executed speedily. But this year He has taught us a lesson and I hope we have all learned it.

This is what I have learned. If I want to be reasonably sure of a good crop I must have my land drained—no use to plant potatoes where a lake will form after a big shower. I must have my land prepared in the fall so that the crop may take advantage of the best growing time which is early in the eason. I must plant good seed. I must culeivate, cultivate, cultivate and spay, spray, spray and Providence will do the rest. What about this year Can we get a vision here of a bumper crop next fall? I hope we can. I have great faith in the power of inspiration. We are asked to grow wheat enough to "bread" New Brunswick. Shall we do it? We are asked to give up "Business as usual" and

The Country Store

IN the evening, when the day's work is done, men like to stroll over to the village store to discuss the war, politics, or whatever may be of local interest.

It is under these circumstances that the health of the family is referred to and experiences are interchanged in regard to medicines that have proven particularly effective.

After Dr. Chase had introduced his medicines to the druggists he found that many who wrote to him for treatment lived many miles from doctor or druggist, and had to depend on the country store for their medicines. Thus it came about that Dr. Chase's medicines were placed in general stores, and you can now obtain them wherever medicines are sold.

Instead of trying to imagine what the man in the picture is saying about Dr. Chase's Kidney-Liver Pills, we shall publish a letter from Mr. James Carr, who attributes his good health and that of his large family to the use of Dr. Chase's Kidney-Liver Pills.

18 Miles From Drug Store.

Mr. James Carr, Maynooth, Ont., writes: "About nineteen years ago I received an envelope containing two of Dr. Chase's Kidney-Liver Pills. I was doctoring at the time with two doctors and, as they did me no good, I used the pills, and by the time I had finished one box I was cured of the pain in the back and shoulders.

"We have great confidence in Dr. Chase's medicines. I have a family of ten children and have never had a doctor in the house for any of them. We live eighteen miles from a drug store, and find that these pills cure nearly all the ordinary ills by regulating the liver, kidneys and bowels. That we are all well and sound I attribute to their use, and I have recommended them to hundreds and given away many a box because I believe there is no medicine so good."

After long experience with Dr. Chase's Medicines we have found that people who try them are soon convinced of their exceptional merits.

We have published thousands of letters to give you an idea of the benefits others have obtained by their use, but if you are still skeptical we shall be glad to send you our

Free Combination Package

One 25-cent box Dr. Chase's Kidney-Liver Pills.
One sample box Dr. Chase's Ointment.

You will kindly mention the name of this paper and enclose a 2-cent stamp to pay postage to Edmanson, Bates & Co., Ltd., Dr. Chase Bldg., Toronto. 4

concentrate our efforts on the things that are necessary to life and necessary for the success of our armies. Shall we do it? Let us resolve that with the help of God and of our Government we shall grow such a crop this year as New Brunswick has never seen before.

The words of the old chorus "Victory depends on you" sums up pretty well the message that is being addressed to the farmer. It comes from a source that we can hardly doubt its sincerity. It ought to put us on our mettle to do our best.

But I must not take up more of your time. Just a word in closing about the experimental farm. We are to visit it on Thursday afternoon. I believe Mr. Hubbard would have undertaken to feed us there again, even after his experience with us on Labor Day, but in planning for the trip our Executive ruled that we had better have all the time free to see and hear what is benig done there. I regard the Farm and the experiments carried on their for our benefit as one of the best things the Dominion Government has done for this Province. That, along with the rapidly increasing work of our own Department of Agriculture, puts us in a position for progress that justifies us in having bright hopes for the future.

What about these meetings? Many of you are asking. Will we get any practical good out of them? Will we learn anything? Let me tell you something. The best authority on teaching that I know of has said this: "Teaching includes the mutual efforts of two persons to the same ned, the teacher must endeavor to cause the pupil to learn a particular fact or truth which he wants him to know, the learner must endeavor to learn that particular fact or truth." The Executive of this Association, assisted by the Department of Agriculture, have endeavored to get the best possible "Teachers" experts in their lines, for these meetings, and if ou don't forget that "The learner must endeavor to lear" you'll learn something.

ISAAC W. BAIRD.
Chipman, N. B.

The Census and Statistics Office has published readily its annual estimates of farm values in 1917 as compiled from the reports of correspondents at the end of January, 1918. The estimates comprise (1) the average values of farm land (2) the average wages paid for farm help and (3) the average values of farm live stock and of wool.

Average Values of Farm Land

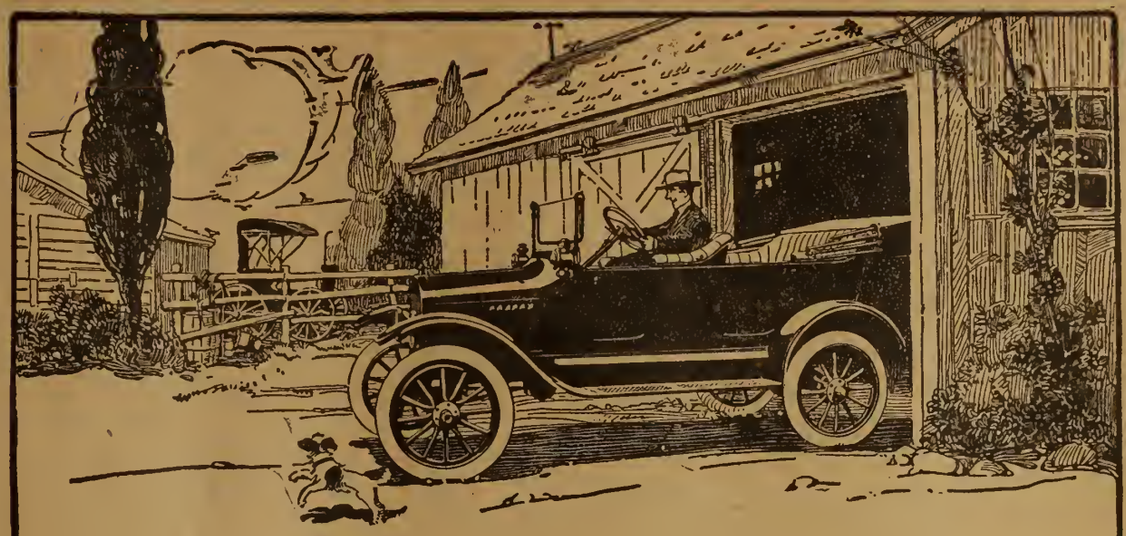
According to the returns received, the average value of farm land for the whole of Canada, including land improved and unimproved, together with dwelling houses, barns, stables and other farm buildings, is approximately $44 per acre as compared with $41 in 1916. The average values by provinces are as follows: Prince Edward Island, $43 7; Nova Scotia, $33.6; New Brunswick, $28.8; Quebec, $53; Ontario, $55.3; Manitoba, $31; Saskatchewan, $26; Alberta, $26.7; British Columbia, $149. In the last named province the higher wages is due to orcharding and fruit growing.

Average Wages of Farm Help

The average wages paid for farm help during the year 1917 have increased substantially since 1916 and have again reached the highest level on record. In many cases they are double what they were before the war. For the whole of Canada the wages per month of farm help during the summer, including board, average $63.63 for male and $34.31 for female help, as compared with $43.23 and $22.46 in 1916. For the year 1917, including board, the wages averaged $610.60 for males and $364 for females as compared with $397 and $228 in 1916. The average value of board per month is returned as $19.44 for males and $14.79 for females as compared with $17 for males and $13 for females in 1916. By provinces, the average wages per month for males and females respectively, in the summer season, including board, were as follows: Prince Edward Island, $39.74 and $22.63; Nova Scotia, $53.75 and $26.43; New Brunswick, $57.19 and $28.14; Quebec, $59.09 and $28.98; Ontario $59 and $31.96; Manitoba, $67.97 and $40.28; Saskatchewan, $73.21 and $41.09; Alberta, $76.09 and $44.44; British Columbia, $78.12 and $48.30,

Average Values of Farm Live Stock and of Wool.

On the whole there is but little change reported in the value per head of horses; in some of the provinces the value has remained stationary or has even declined. For cattle, sheep and swine, however, values are substantially higher than last year and are higher than in any previous year for which records have been collected. For Canada, the average value of horses, three years old and over is $167 as compared with $160 in 1916, milch cows are $84 as against $70; cattle between one year old and three years average $52 against $43; sheep are $14.93 against $10.48 last year and swine are $17.33 against $11.98 per cwt. The average value of wool is 59 cents per lb. unwashed and 75 cents per lb. washed. Correspondents were requested to ascertain as nearly as possible the average value per head of each description of farm animal, and for calculation of total values these averages have been applied to the total number of farm animals as returned in June last. The results are as follows: Horses $429,123,000 as compared with $418,686,000 in 1916; milch cows, $274,081,000 as against $198,896,000, other cattle $270,595,000 as against $204,477,000, sheep $35,576,000 as against $20,927,000 and swine $92,886,000 as against $60,700,000. The total value of farm live stock in Canada is estimated to be $1,102,261,000, as compared with $903,686,000, the estimate for 1916 as finally revised by the Census returns for the Prairie Provinces. In 1917, for the first time, the total value of farm live stock exceeds one billion dollars.



Replace Your Buggy With a Ford

MORE than 100,000 Fords are owned by people in Canada in preference to the old horse-drawn buggy and other makes of cars.

Your neighbors, and farmers in every section of the Dominion are abandoning their old buggies—selling their driving horses and buying Fords.

Ford cars are utility cars. They are built to endure the strain of constant daily use over rough roads.

These are the tests every farmer gives his car. The Ford meets them in a satisfactory manner. It is the farmer's car, so why not replace *your* horse and buggy with a Ford?

SAVE CANADA. BRITAIN AND HER ALLIES

(Continued from page 377)

he has to face in respect to seeds, fertilizers and labor because of the war. War means hardship and service by all and acrifice to the uttermost by some. Otherwise we cannot win. The following is a part of the contents of a card to be left with each farmer:

FAMINE THREATENS OUR ALLIES

The Farmers of Canada are Called Upon to Save the Situation

This Farm is Dedicated to the Greatest Possible Production of Foods in 1918

To this end I will reconsider my plans for crops this season, and will endeavor to sow the largest acreage I can manage of wheat, barley, oats, buckwheat, rye, peas, beans, foddders, potatoes, roots and other food producing crops; and I pray that the blessing of God may rest upon our labors.

Date.....

Name .....

Address .....

County .....

Issued by the Department of Agriculture of the Province of New Brunswick in co-operation with the Dominion Department of Agriculture.

These departments earnestly request every farmer to co-operate heartily in the means adopted and with the local greater production or other committees that may be organized for the purpose of promoting agricultural production and to do his part to increase his acreage of cultivated crops and by not less thain one acre and, in the case of the better equipped farms, by from five to ten or more acres.

The lieutenant-governor will be advised to proclaim the second week of April a week dedicated to preparation for increased production. During that week the people of the province will be asked to consider and again consider how each one can help. The farmers will be requested to reconsider the areas for crops in 1918 in order that as many aditional acres as possible may be sown or planted. Seeds will be got ready. Machinery, tools and harness will be put in order. Spare parts will be provided to avoid delays in the busy season. A lost half day may affect harvest.

A committee for greater production will be organized in every parish or in as many parishes as it may be practicable to overtake this spring. The members of these committees will be practical farmers who have the confidence of the communities. It is expected that some member of the committee will personally visit every farmer in the parish to explain to him the gravity of the situation, to leave with him a card such as I have described, an dto enlist his earnest determination to do his very best this year.

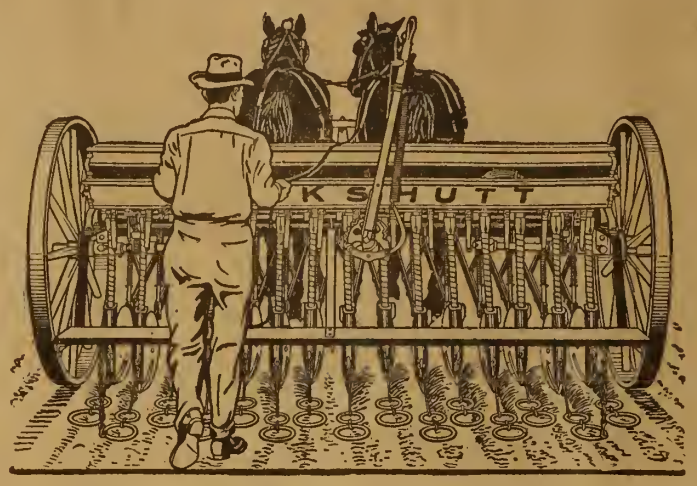
The plans for greater production provide for giving the farmers all the help which is practicable under war conditions. Further action is being taken to ensure that every farmer will be able to purchase suitable seeds; and to purchase as large supplies of ftrtilizers as can be procured for use in the province. Merchants who do their business in such a way as to enable the farmers to purchase these essentials at the lowest possible price are thereby doing real patriotic service. Such ervice has values far exceeding the amounts represented by a few dolalrs more or less profit.

Assistance will be given in the organization of means to secure and place on farams all available supplementary labor for hoeing, haying and harvesting. This will include the enrollment, placing and supervision of boys in their teens from the schools and colleges as soldiers of the soil. Each will receive a dominion national service badge.

Illustration will be made of economical ways of feeding hogs during the summer. Provision has been made for the further extension and supervision of the cultivation of vacant lots and gardens in the cities and towns. By these and other means the farmers will be assisted to do all that can be done this year and coming years to help to avert the calamity of famine which threatens our Allies and the neutral nations in Europe.

No one has the right to stand apart, or stand aloof, and merely urge a duty upon farmers. They are willing to do their best, even to the very uttermost. What they need, what they want and what they are entitled to receive, are information and guidance and assistance toward the formation of their own greater production committees in ever municipality. They also need assistance which will enable them to obtain seeds and fertilizers as far as these are obtainable and supplementary labor for hoeing, haying

Rapid but Scientific Fertilizing



With high priced commercial fertilizer you must be sure that every ounce is properly made use of

And not only used exactly where you want it and in the exact quantity you want, but done with the least possible work and attention on your part. There's where the Cockshutt Combination Seed and Fertilizer Drill comes in—big. Moreover it is a machine that will stand up under the hardest work for years and years to come and will not fail you at a critical moment. It's practically a repair-free Drill.

Cockshutt Seed and Fertilizer Disc Drill

The frame is high-carbon steel which gives immense rstength with lightness; cannot sag in the centre. Cochshutt axles always run true. Its seed and fertilizer regulators are almost human—the machine will sow any quantity of either per acre you desire to the fraction of a pint. You can sow seed and fertilizer together or either one separately. Both wheels are drivers, you sow on corners as well as in the field. When discs are raised out of ground the whole machine is thrown out of work. It is one of the neatest, easiest worked machines you have ever seen. Built in 5 sizes with either 6 or 7 inch spaces.

THE NEAREST FROST & WOOD AGENT WILL BE VERY GLAD TO EXPLAIN THE COCKSHUTT DRILL VERY THOROUGHLY WHETHER YOU WISH TO BUY NOW OR NOT. WRITE HIM OR OUR NEAREST BRANCH FOR OUR CATALOGUE.

THE CANADA STARCH CO. LIMITED, MONTREAL. 8

Forty-nine bushels to the acre

Grown in Ontario

The splendid wheat yield pictured here was grown in Western Ontario last summer on well prepared soil enriched with 300 pounds of fertilizer.

Greater Crop Yields

Greater crop yields in Canada are of world-wide importance. European yields on old soils far exceed Canadian yields on new soils—except when improved methods produce crops like that pictured here.

Announcement: The Canadian Fertilizer Association have established a Bureau which will encourage and assist Canadian farmers to achieve greater results in soil tillage, fertility maintenance and crop production. This Soil and Crop Improvement Bureau, under the direction of Henry G. Bell, (a native of Ontario and a graduate of Ont. Agr. Coll. later Prof. of Agronomy Univ. of Me.) co-operates with all organizations working for the improvement of Canadian farming. Farmers are urged to take full advantage of this valuable information service which is free to all.

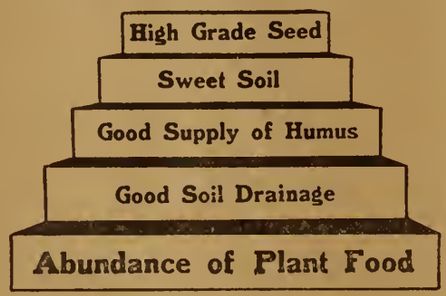
Fertilizer

If the labor problem limits areas under crop you can increase yields 50 to 75 per cent. by careful soil preparation, seed selection and judicious use of fertilizers, and thus use the labor to best effect.

Fertilizers carry exactly the same plant food coustituents as are carried by manure, but in more concentrated form.

Dr. C. A. Zavitz reported in 1917 the following *results.* Complete fertilizer used with winter wheat gave an increase of 5.2 bushels per acre at a cost of 82 cents per bushel (pre-war prices) when applied in the autumn; *and an increase of 8.3 bushels per acre at a cost of 51 cents per bushel when applied in the spring.*

STEPS TO BIGGER CROPS



What to do Now

Top-dress fall wheat with fertilizers. It is your last opportunity to increase 1918 fall wheat yields.

Prepare to fertilize spring crops.

Use fertilizers this spring and profit by high crop prices.

Manure

Manure spread thin yearly (4 or 5 tons per acre) pays better than manure applied in equal quantity at one application every four or five years.

Eight tons manure (protected from rain and snow) strengthened by 320 lbs. acid phosphate to the acre increased wheat yields at Ohio Experimental Station 5.38 bushels per acre.

Similar fertilization increased corn yields 11.54 bushels per acre.

If you do not have enough manure to apply this quantity per acre, use complete fertilizers rather than acid phosphate.

Send postal card today for Bulletin, "How to Increase Ontario Crop Yields"

Soil and Crop Improvement Bureau

and harvesting seasons. Everything that can be done is being undertaken to meet these needs. When the farmers understand the gravity of the situation they will meet it so far as flesh and blood and unfaltering spirit can do so.

All this is war service, and because it is war service it must be done with diligence, intelligence and determination. It is not romantic or dramatic; it does not appeal to the emotions, but because it is necessary war work, it requires all the more intensity and continuity of determination on the part of those doing it. By the bessing of God a sustaining army of 400,000 farmers in Eastern Canada can save the situation. I pray that the Almighty may give the farmers and their families health and strength of body mind and soul for their heavy, heavy tasks, and that He may crown their labors by the blessing of a saving harvest."

After the address in the Legislative Assembly Hall, Dr. Robertson met the members of the Provincial Increased Production Committee and the delegates from all parts of the province in one of the committee rooms of the Assembly building where a general discussion took place.

Among the matters to which some of the delegates took exception were the taking of men from the farms for military service, the difficulty in securing feed grains from the millers, the porposed daylight saving act, the recruiting of men from the rural districts for work in cities an din the west and alleged discrimination against transportation of farm supplies in favor of automobiles and other non-essentials.

The lack of labor, seed and fertilizer were mentioned among the difficulties in the way of greatly increased production.

To the foregoing complaints, Dr. Robertson replied:

"If you had seen the way the men in the trenches overcome apparently insurrmountable obstacles, your own difficulties would seem smaller."

After a general discussion hearty support for the campaign was pledged by the deegates.

THE LOCAL FLOUR MARKET

There was no important change in the condition of the market for flour. A steady trade continues to be done in spring wheat flour for domestic and outside account, but the orders are principally for small lots to meet actual wants. Car lots of Government standard grades for shipment to country points was quoted at $11.10 per barrel in bags, f.o.b. cars, Montreal, and to city bakers at $11.20 delivered. The tone of the market for winter wheat flour remains firm, with a small business passing in broken lots at $11.40 to $11.50 per barrel in bags, ex-store. Rye flour is still scarce on spot, for which the enquiry is fairly good and prices rule firm at $7.20 per bag. The demand for corn flour is steady at $6.50 per bag.

SHORTHORNS For Profits

Shorthorn steers dressed the highest percentage at the Chicago International in 1917. Shorthorn steers are preferred by the largest buyers of feeders on the Chicago market. Shorthorn steers show greatest weight for age.

SHEEP RAISING IN BIBLICAL TIMES

The late Dr. Benjamin T. Kneeland, who was surgeon of the First New York Dragoons during the Civil War in the United States was sent with his regiment to a military camp, where the sanitary conditions in general were good, and the tents were moved frequently, the bedding aired regularly, the grounds kept clean, water supply good, and well cared for, and to all appearances everything was being done to promote the health of the soldiers. In spite of all precautions, the latrines, where was dumped all the refuse from the camp, gave forth a very displeasing and unhealthful odor. Lime and other disinfectants were freely used, but the odor persisted. Dr. Kneeland called for a detail of men and immediately had them spread a thin covering of fresh earth in the latrines. This was repeated each day. The odor soon disappeared, and the Surgeon-General, on making his rounds of inspection, mentioned that he missed the odor that had always characterized Uncle Sam's Military Camps. Dr. Kneeland explained the reason and Col. Gibbs, commander of the regiment, who was present, spoke out saying that it was a fine idea, and asked Dr. Kneeland if it was original with him. The doctor explained that it was not, that it was old and that he had gotten it from an old book. Col. Gibbs was a widely read man, and prided himself on his knowledge of things in general, and of medicine in particular. He said he would like to know what book it was. A very old book indeed Dr. Kneeland assured him, and one that he (the doctor) supposed Col. Gibbs had read, at least if he hadn't he ought to; and with that he stepped into his tent and brought out a copy of the Holy Bible. Turning to the sanitary laws of Moses he showed the Colonel his authority for the use of earth as a de-odorizer and disinfectant. Soon after this the use of earth in covering latrines became almost universal throughout the military camps.

When medical men of modern times are able to learn something relative to their own profession from so old a Book, it is not beyond the range of possibility that flock-masters may have overlooked the many references that it contains relative to the sheep industry in those days, and the amount of good advice which it offers.

The first mention of sheep in the Bible is found in Genesis 4:2, "and Abel was the keep of sheep." The 29th chapter tells of the watering of the flocks, and the second chapter of Exodus shows how the shepherds fairly fought to get a chance to water their sheep, yet in this country we sometimes find men who think the morning and evening dew, the juice of the grasses, and the snow in winter is all that is needed as drink for the sheep. In fact once in a while is found a writer who will offer such advice. It is true that water is not so plentiful in those lands, and the climate is hotter and drier than in Canada, but there is no more reason why sheep should not be watered than any other class of farm animal.

Numbers 32:24 gives an explicit command to the people to build folds for their sheep, and according to the 36th verse, they did so. All through the Bible mention is made of the folds prepared for the sheep. In modrn days are found farmers who arrange quarters for the rest of the farm stock and give the sheep any place that happens to be left, and never think of building a special place for them.

The sheep folds of Bible days were built in such a way as to prevent wolves from getting into either the fold proper or even into the yard of the fold. Would it not be equally wise to build dog-proof fences around the sheep yards in Canada to keep the dogs and the coyotes away from the flock?

Throughout the Bible is found mention of the shepherds' table being supplied with lambs and mutton, yet how many farmers of to-day use either for food? Why not have fresh mutton or lamb on the home table? Farmers' families enjoy good things to eat as well as other people, and there is no class of people who can better afford to eat fresh lamb than the farmer. He will kill a hog, and in rare cases a beef, but seldom a sheep or lamb. It is an economical and healthful meat food, and there is no good reason why farmers should not enjoy it.

There are some men who engage in the sheep business, and as soon as they lose one or two of their flock from some cause or other, immediately go out of the business. To such men, the story of Job's flocks should be of value. Job had seven thousand sheep and lost them all (Job 1: 3, 16), yet later we find Job in the sheep business, and possessed of fourteen thousands. (Job 42: 12).

The twin bearing sheep was sought in the olden days, and here too the modern farmer may get some good advice. How many farmers persistently breed twin bearing sheep, and from a ram that comes of twin bearing stock? How often do sheep men sell off the well matured lambs and when extra breeding ewe are necessary, keep those that wyould bring the least amount of money on the market which are the poorest and scrubbiest ones of the flock, paying no attention to the twin bearing and rapid growing qualities of the breeding stock, and in the purchase of a ram does not price count more than desirable qualities?

Searching for the lost sheep implies something more, that surely is plain to all. "If a man have an hundred sheep and one of them is gone astray." How can the shepherd know if one

CHEVROLET

MODEL F-A

Baby Grand Touring Car

A New, Efficient and Powerful Model which materially reduces motoring cost.

Now that the motor car is a necessity to crowd more into the busy day there is a demand for a sturdy, roomy, powerful car, economical to buy and economical to run—a car that is comfortable and will give good service day in and day out.

This new Chevrolet model fills this demand and is offered at a price far below that warranted by its value, and represents more CAR for your money than any new model on the market. See this model before you buy.

be gone astray if he does not count his sheep unless it be one that for some special reason he would miss, and when a sheep's lost it is seldom one that he has any particular reason for missing. Every flockmaster hould aim to make it his business to count his sheep every day to see that none are lost.

John 10 tells of the sheep knowing the voice of the shepherd. This would not be possible did they not often hear him speak. This is a piece of advice that every flockmaster would do well to heed. Talk to your sheep that they may know your voice, and be not afraid. Again, "and when he putteth forth his own sheep, he goeth before them, and the sheep follow him." There are several good reasons why it is better to lead your sheep than to drive them, and sheep will follow a good shepherd. Good flockmasters lead their sheep. Do you lead yours or drive them? The good shepherd knows his sheep and his sheep know him. Would you know one of your flock if you found it in another flock? Many, no doubt, will think this impossible. Not so. Sheep do not look any more alike than persons, when you once get to know them.

David, who was a shepherd lad, and knew well the habits of the sheep, speaks in the twenty-third psalm of "still waters." Sheep do not like the swift running wataer to drink from and flockmasters should plan that their flock has an opportunity to drink where the water is "still" or smooth. Most sheep men know this yet some may not.

"And gently lead those that are with young" should impress upon all that ewes that are heavy with lamb should be handled carefully and not allowed to be excited or chased.

The ancient Israelites had shearing houses as will be found by reading 2 Kings 10: 12, and this might be a suggestion to those who use straw littered floor for sheagirring purposes. A clean place to shear will keep the fleece cleaner and assure a higher price for the wool.

There is nothing new in all this, in fact it would be strange indeed if there were, for farmers in Canada are Christian men, who have read this wonderful book and obtained from it all that is here contained, yet it is more than possible that they never before had it all tigether in one article.—By A. K. LeMarr, in Thornbury Review-Herald.

WINTERING YOUNG HORSES OUTSIDE

(Experimental Farms Note.)

With the prevailing high cost of building material and labor, many farmers are deterred from going very extensively into live stock raising under the impression that a heavy outlay for buildings is necessary.

Such is not the case. While work horses and milking cows require warm stabling, sheep and poultry, in order to be profitable, must be kept away from warm quarters; brood sows do excellently in small individual cabins; young cattle thrive when running outside with only a shed for shelter. Even dry cows and idle work horses can be wintered under cheap shelter.

The reason these classes of live stock do so well wintered outside is that they get what is hard to obtain when kept inside, namely fresh air and exercise, and are, as a result, in good health and fit for profitable breeding operations.

Wintering Young Horses at Cap Rouge

During five years, fifteen different young horses were wintered outside, at Cap Rouge Experimental Station with only single board sheds as shelters. Though the temperature went down as low as thirty-one degrees F. below zero, not a single one has ever been known to shiver. Moreover, as a rule they commence to shed their hair earlier in the spring than others kept in the barn. During an outbreak of influenza, all the animals inside were sick whilst not one of those in the open was affected.

Shelters

Any shed which is free of draughts, and with an opening to the south, will answer the purose. If it is placed on a slight elevation, so that water may not run in, there is no need of a floor, ground floors are best. Shingles or paper may be used for the roof, which must be perfectly rain-proof, for metal will get the place too warm during the summer. As only one thickness of lumber forms the sides, it should be grooved and tongued.

Feed Requirements Outside

The main objection to keeping stock in cold shelters during winter has been that more feed is required. That the contention is correct cannot be disputed, if the conditions were always perfect in warm stables. But, as a matter of fact, there are very few well ventilated barns in the country and it is a question whether there is not as much loss of feed through bad digestion, due t o the foul air breathed inside such buildings, as through the extra amount given outside.

DUNLOP TIRES

What "Dunlop" Means

PEOPLE never speak of over-production in Quality, yet we might "trim down" "Traction" or "Special" and conscientiously sell them to you as good tires. But we could not still call them "Dunlop." That word in tire value means more than merely making a tire. It means a reputation for superior tire-making that embraces nearly a quarter of a century—a reputation which was obtained only by endless energy, and is maintained only by ceaseless vigilance.

A. 93

"SPECIAL" - "TRACTION"

Every planting season you stake land, fertilizer, time, work, and the cost of the seed on the good faith of your Seedsmen.

Every season for Forty-five years EWING'S SEEDS have justified this good faith.

They are clean and fresh—they show a very high percentage of germination—and are true to name and type. They include all the best of the new varieties, as well as the old favorites.

Write early for our new Illustrated Catalogue, and if your dealer hasn't Ewing's Seeds, order from us direct.

FARM HELP AVAILABLE

25000 Older Canadian Boys Have Volunteered

TO HELP THE FARMERS

Last year 7,000 Older Boys demonstrated to the farmers of Canada that they could help take the place of the regular farm help that has gone overseas.

They proved their willingness and ability to adapt themselves to farm work.

This year many farmers are asking for boys.

Already 25,000 boys between 15 and 19 years of age in Ontario and western Canada have offered their services as SOLDIERS OF THE SOIL. The enrollment week for New Brunswick takes place April 28th to May 4th. The plan is to have the boys fill in the enrollment forms which will be turned over to the Department of Agriculture.

The farmers are asked to write to the Minister of Agriculture stating what help they require and for what period.

Arrangements as to wages will be agreed upon by the farmer and the boy.

J. F. TWEEDDALE,
Minister for Agriculture.
Fredericton, N. B.

S. O. S.

Apropo the Soldiers of the Soil movement outlined above, Mr. Reek, Deputy Minisiter of Agriculture for New Brunswick recently issued the following letter to every Agricultural Society Secretary in the Province.

"It is needless for me to mention to you the great need for production, because every man in Canada is aware of the very serious conditions in the allied countries.

"Labor is one of the greatest obstacles to overcome and in order to give some assistance, boys from 15 to 19 years of age are being enlisted to work on farms throughout the summer months. It is not anticipated they will take the place of men, but by a tlitle training they will undoubtedly assist in the work. The wages are to be arranged by the farmer and a travelling supervisor in order that the boy may receive just what he is worth and no more; the forms to be filled ask what wages the farmer expects to pay but this is only approximate.

Will you kindly bring this before your Society immediately, and if any farmers wish to avail themselves of this help fill in the forms and return to me. Please do not hesitate because there is only one month to make arrangements."

FARMER'S APPLICATION FOR BOY TO THE PROVINCIAL EMPLOYMENT BUREAU

.....191

I desire to secure a boy for farm work commencing.....191
The wages I expect to pay will be.....with board.
I will require the services of the boy until .....

"Harnessing the Air" to Save Butterfat

The air is a great wizard. Properly employed, (as in a Sharples Suction-feed Separator) it will save North America more than eighty million pounds of butter which fixed-feed separators *waste* because 95% of them are turned below speed much of the time.

The Sharples Suction-feed principle really harnesses the air and makes it work for you. By means of the suction-feed, just enough milk enters the tubular bowl as can be *perfectly separated*. As your speed varies so does the suction-feed. Thus, Sharples saves the cream waste that results when fixed-feed separators are turned under speed.

SHARPLES SUCTION-FEED CREAM SEPARATOR

Skims Clean at Any Speed

While *air* is free to everybody, yet the suction-feed principle is exclusive with Sharples and fully protected. Bear that in mind when you investigate a separator and insist on knowing if it will *skim clean at any speed*. Get *proof*.

There are *no* discs in a Sharples tubular bowl which adds further to its superiority. The one-piece bowl is easy to clean, easy to turn—even for a boy. Write nearest office for catalog, addressing Dept. 79

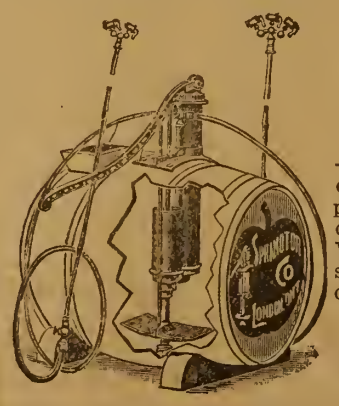
The Most Modern Weapon

For Protecting Your Field and Orchard Crops

from being destroyed, (or their market value lessened) is the SPRAMOTOR. It will enable you to combat the potato beetle and blight quickly and effectively—in the orchard—to produce 75% No. 1 fruit and have cleaner, healthier trees—free from scale and bark-louse.



Spramotor
Isn't a SPRAMOTOR unless we made it

We make a complete line of sprayers—one for every need from the small hand outfit to the large 250 gallon gasoline power sprayers. They are all Spramotors, and range in price from $7 to $400. Write us for requirements or at least send for our catalogue and Free booklet on Crop Disease. Get your copy to-day.

Made in Canada. No duty to pay.

Hay, Loose, 90c to $1.00 per 100 lbs.

MONTREAL

DAIRY PRODUCE TRADE

The receipts of butter today were 96 packages, as compared with 127 for the same day last week, and 434 for the corresponding date a year ago. There was no actual change in the condition of the market for creamery butter today, but the undertone was strong and the feeling in some quarters of the trade was that prices may possibly advance in the near future on account of the very limited quantities of finest goods available on spot. A buyer today bid 49c per lb. f.o.b. point of shipment for a lot of finest new-milk creamery and did not get it, which would indicate that it was sold at a higher figure. A steady trade continues to be done in oleomargarine in a wholesale jobbing way and prices are unchanged at 32c to 34c per lb. as to quality.

We quote prices as follows:

Finest Sept. and Oct. creamery	49c to 49½c
Fine Sept. and Oct. creamery	48c to 48½c
Finest dairy	42c to 43c
Fine dairy	40½c to 41½c

The receipts of cheese today were 113 boxes, as against 98 for the same day last week, and 39 for the corresponding date a year ago. The market today was without any new feature to note. A fair amount of business continues to be done for the season of the year for both export and domestic account and sales of small lots of 20-lb. cheese and twins were made at 23c per lb.

The Commission is paying the following prices:

No. 1 cheese	21¾c
No. 2 cheese	21¼c
No. 3 cheese	20¾c

PEDLAR'S
PERFECT METAL
CEILINGS
AND WALLS

Why spend money on paper every spring? Why go to all the bother and expense of redecorating? Far better as an artistic interior finish are Pedlar's Perfect Metal Ceilings and Walls. They are made from sheet metal, modelled into many artistic designs. Once in place they cannot crack or fall away. They will never burn. They make rooms so pretty and cosy and snug. There are special designs for all rooms—kitchen, dining-room, parlor, bedroom, halls, etc. And they are so easy to put on. All you need is a hammer and some nails—then go ahead. Simplicity itself! Fix your house up this way and it will last your lifetime. No more soiled paper, or broken plaster. All walls always in good condition and giving a great increase in protection from fire.

THE EXPERT JUDGE AND COMPETENT BUYER OF HORSES

(Continued from page 387)

technically termed, is most marked in the old horse and practically absent in the young one, the part being filled with fat. To make an old horse appear younger, the "gyp" horse dealer fills the cavity with air, a trick called "puffing the glims." The finger detects this at once, as a cracking sound is emitted on handling, and in addition one will notice that the hair on the temple of an old horse has turned grey, while the lower jawbone feels sharp and thin, and the wearing of the grinding tables of the teeth also tells the story of advanced years.

In a dark place the pupils of sound eyes dilated, so lead the horse into the light and notice if contraction of the pupils occurs. If it does not, the eyes are unsound. In blindness from paralysis of the retina and optic nerves (amourosis, or "gass eye") the pupils are permanently dilated and the eyes consequently appear unusally bright and prominent, although the horse is "stone blnd." Such a horse can look squarely at the sun without blinking or contraction of the pupils, whereas a horse that is almost entirely blind sees a glimmer of light when turned to the sun, shows it by looking upward, whereupon the tricky dealer remarks to the unwary buyer: "See what strong eyes he has. He can look right into the sun."

Books and articles on the examination of horses for soundness advise that the soundness of the eye should be tested by a threatened blow of the hand. If the horse can see he flinches on noticing the approach of the hand, otherwise there is no winking of the eyelids. This test is useless if not very gently done. A blind horse will wink if he feels a column of cold air strike the eye, or if the fingers touch one of the long hairs projecting from the skin under the eye. Look for these long hairs. They are called "tentacles," have special nerve endings, so are sensitive and when touched communicate the message of impending danger to the brain, and the eyelids instantly close They serve the same purpose as the long hairs or feelers projecting from each side of the muzzle of the cat, and in the horse also are found in that region.

A. S. ALEXANDER, M.D.C.

AGRICULTURAL SOCIETIES UNTED SEEK WIDER POWERS

Has Asked the Government to Extend Scope so that Feeds and other Commodities May be Handled Wholesale

The New Brunswick Agricultural Societies United has asked the New Brunswick government for additional powers in respect to carrying on its business in this province. Under the order-in-council under which the organization was established, only fertilizers can be handled. The act, however, enables the governor-in-council to extend the usefulness of the institution and it is felt that the time has arrived when greater powers should be asked for. The work done by the N. B. Agricultural Societies United, has been of great benefit to the farmers of the province. Thousands of dollars have been saved through the co-operative purchases of fertilizers. The demand is now that other lines be added to the fertilizer side of the business and when the authority is secured, the work will be undertaken. It is well to again repeat that all agricultural societies in the province who are interested, should get their fertilizer orders for 1919 under way at once. It is certain that the supply for 1918 will be far short of the demand. Next year conditions will be worse, if anything, and those who want chemical fertilizers should take action NOW.

THE CORN CROP IN QUEEBC

Nearly every farmer knows what his corn crop means to him in his live stock work. First, it makes, when put into the silo, one of the cheapest and most palatable of feeds as well as one that makes a good balanced ration with clover, hay, roots, and a small amount of grain, for milk production as well as beef. It is also very serviceable to feed to sheep, idle horses and colts, in limited quantities. Second, it is one of the best crops to work into your farm rotation, for the frequent cultivations that are necessary to get the best results with corn, clean the soil well of weeds and leave it in the best possible shape for the following crop, which is generally grain of some kind seeded down with ten to twelve pounds of clover and ten pounds timothy added per acre.

At the Experimental Station, Lennoxville, Que., it has been found that corn does the best on a clover sod. Manure is spread in winter on the corn ground as drawn from the stables, so as to save labour, at the rate of about fifteen tons of manure per acre.

In spring this manure is ploughed under with the green sod, turning quite a shallow furrow, say five inches. The manure and green sod, when turned under and packed properly, commence to decay, warm up the soil and give the yuon gcorn roots the best chance possible. The ploughing of the corn ground may be left until nearly ready to plant, for the soil is then generally in better shape to work. The plough si followed with the double disc harrow so as to pack the furrows, save evaporation and also to get a good seed bed before the soil gets baked, as it will if left exposed to the sun long after ploughing before being worked.

By all means be sure to have as perfect a seed bed as possible before planting, for that is half of the battle. When you have this be sure to have the best seed possible with good germinating qualities and of the variety best adapted to your district.

At Lennoxville, in the Flint varieties, Compton Early and Longfellow, and in Dents, Wisconsin No. 7 and Early Leaming have been found to be about the best.

Corn should be planted thirty-six to forty inches apart in rows according to the variety, but if weeds and couch grass are present it might be preferable to plant in hills three feet apart each way, in order to allow for cultivation both ways. When planting in rows, try to arrange to have the rows run north to south in order to let in the most sun possible, which is needed so much in this district for this crop. Frequent cultivation and the hoe around the plants are very essential.

As to the mode of harvesting and conserving this important crop, the silo is strongly recommended, but if shocked up in quite large shocks and tied with binder twine near the top, and left in the field until required, the corn makes very good feed when run through the cutter, though not nearly so much relished as is the ensilage.

A NEW PLAN FOR COW TESTING

The time has come when a change of pla nfor the cow testing work seems to be imperative. The Dairy Record Centres have served their purpose, but a more comprehensive scheme, whereby the whole country will be covered instead of limited areas, now seems to be necessary. This is all the more important in view of the desirability of increasing production as much as possible, and there is no simpler or easier way of increasing dairy production than to improve the yield of the dairy herds.

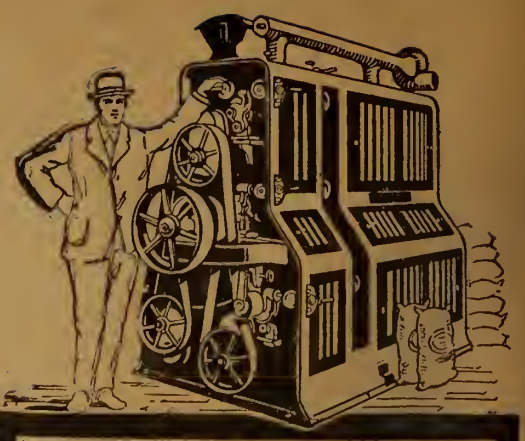
The Dairy Record Centres will cease to exist and the position of Dairy Recorder will be abolished after May 1, 1918. In place of such organization the Department will enlist the services of cheesemakers, buttermakers and other qualified persons to test samples of milk, paying sufficient to make it worth while for anyone to give some attention to it.

By transferring the work of the Dairy Recorders to a larger number of persons who are already employed, some 3 men will be released for other work.

The average yield of milk per cow has increased 30 per cent. in recent years, but there is still room for improvement.

By this new plan we hope to reach a large number of milk producers who have not so far been keeping records and thus give a further impetus to herd improvement.

J. A. RUDDICK,



Be the Miller in Your Town

Thousands of new acres of wheat mean increased production this year. Governments — Federal and Provincial—are behind this great movement for bigger production.

Your community will grow wheat. Be the man who will turn it into flour.

A Marvel Mill

offers you this opportunity. *A Marvel Mill makes a better barrel of flour cheaper.* It will mill any grade or any grain. It helps relieve waste and shortage.

It Makes Real Profit for You

Here is an opportunity to establish yourself in a substantial, money-making business and serve your country's greatest need. One man can operate a Marvel Mill — no expensive buildings needed. If you have as little as $3000 to invest you should get all the facts of this proposition at once. Write today.

Palmer's Summer Packs

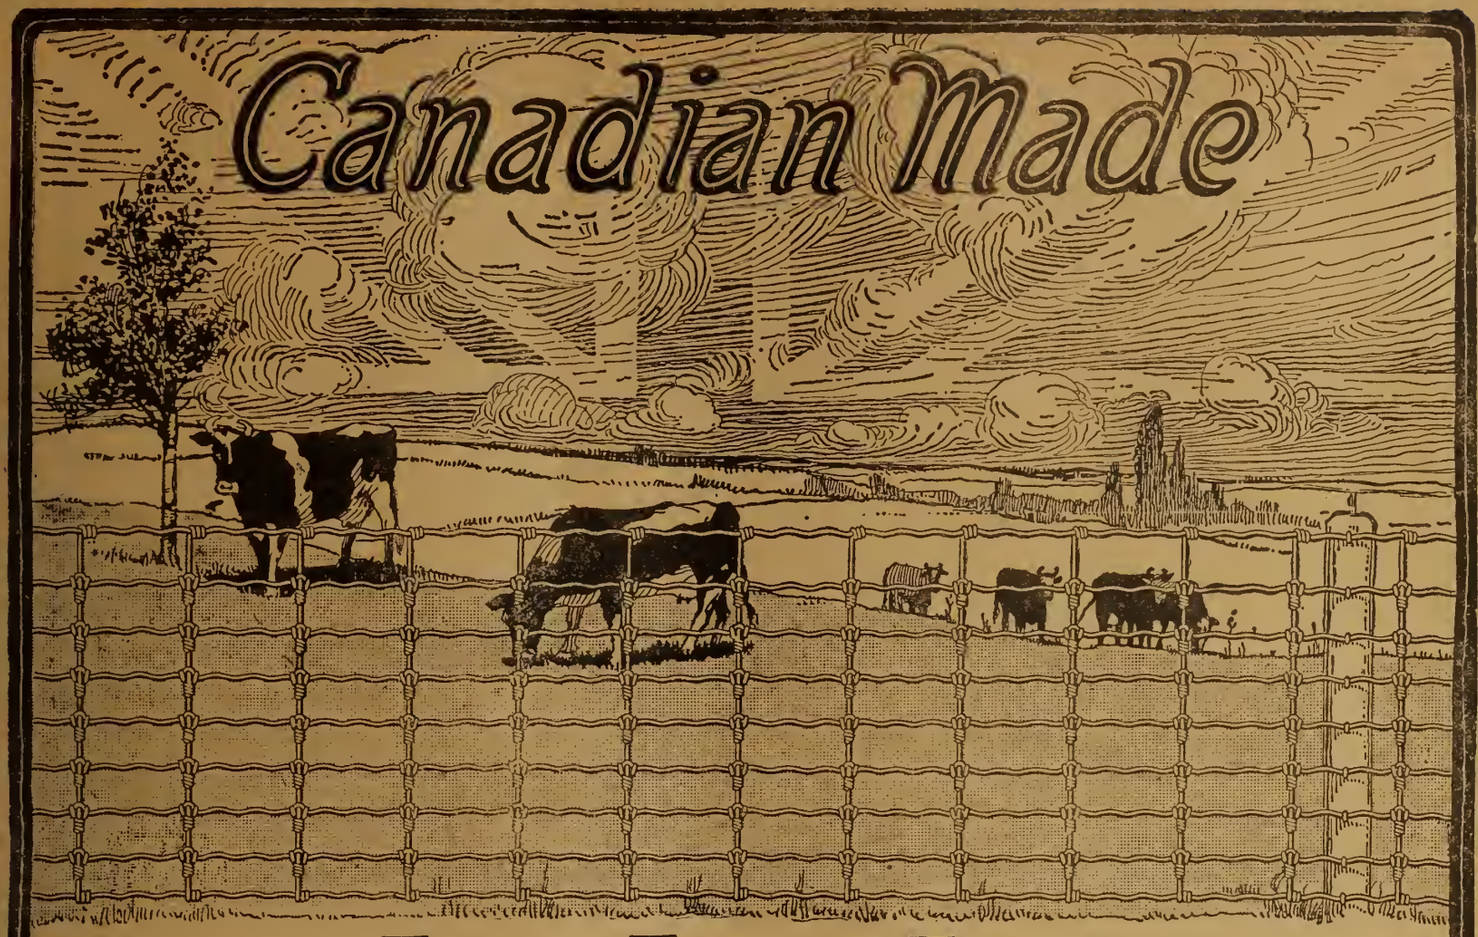
JOHN PALMER CO. Ltd MOOSE HEAD BRAND FREDERICTON N.B.

are sometimes called plough shoes or harvest shoes because they are especially designed for wear in the ploughing and harvesting seasons.

You will not be troubled with tired, aching feet after doing a hard day's work in Palmer's Summer Packs, because they are light in weight, durable, roomy, comfortable and waterproof.

Ask your dealer for a pair of these. "Moose Head Brand" shown above is stamped on every pair.

JOHN PALMER CO., LTD.
FREDERICTON, N.B., CANADA. 34



Frost Fence First

Here stands a FROST fence—one of the thousands defying the stress of weather and strain of usage on Canadian farms.

In every Province of the wide Dominion you will find FROST fences giving service that makes their owners proud.

FROST fence stands up bravely and triumphantly against all kinds of Canadian weather because all varieties of Canadian climate are taken into consideration when making FROST fence.

Unlike common fence, ordinary commercial wire is not used for FROST fence. We make the wire for FROST fence in our own wire mills. The steel has the right temper and the wires the smooth, careful galvanizing that is required to withstand extremes of Canadian temperature, fog, snow, hail and rain.

The laterals have the special FROST wave, that makes the fence exceptionally elastic and enables it to withstand strains that would rip and snap an ordinary fence.

The FROST lock is unlike any other. Look at it. There is nothing cheap or flimsy about it. Plenty of wire, and to spare, is used to wrap it around the stay and lateral so that it cannot work loose.

SERVICEABILITY is put into every inch of FROST fence. It is FIRST in quality as well as FIRST in sales. It is FIRST choice with those who want the longest service and the neatest, strongest fence they can get for their money.

A style for every purpose. If you do not know a nearby dealer, write us direct. 102

FROST STEEL AND WIRE COMPANY, LIMITED, Hamilton, Canada

GREAT SHEEP DRIVE IN NOVA SCOTIA

Not many years ago almost every farmer in Nova Scotia had a few sheep but we find today very few farmers have any. Fifteen meetings during the last week in February and the first week in March were held in Cumberland County. Both Provincial and Federal officials took part at these meetings. This is an ideal county for sheep raising and it is expected that there will be a large increase this year in numbers kept. Many farmers wish to buy sheep at the present time, but there are very few for sale in this district.

The principle reason for the decrease has been the dog nuisance. Therefore, if this drive is going to be successful there must be a hard and fast law to protect the sheep industry from dogs. The law to shoot the dog caught worrying sheep is useless as 90% of the farmers would rather do away with their sheep than have trouble with their neighbors. The new dog law in Pennsylvania which went into effect on January 15th could well be applied to Canada. It provides that every owner of a dog 6 months old or more must obtain a license from his County officials costing $1 to $2 for male dogs and from $2 to $4 for females. A metal tag accompanies each license and must be worn by the dog at all times. Furthermore all dogs shall between sunset and sunrise be confined within an enclosure firmly secured by a collar which will retain them on the premises. Under an effective law such as this farmers will be encouraged to go into the sheep indutry for it is, at present prices, exceedingly profitable.

Some years ago this was not the case for under the method of marketing the lambs and wool poor returns were obtained. The increased returns are due to the general upward trend of prices and to co-operative selling in wool and lambs. Wool experts have been employed since 1913 by the Federal Department of Agriculture to demonstrate the best method of preparing wool for sale. There has been great improvement in the condition in which wool is offered for sale so that it finds a wider market and buyers are eager to purchase it which was not so a few years ago. Canadian wool was formerly a drug on the market, but it finds a ready sale now on markets where it was unknown before. The same is true of co-operative sales of lambs where it has been tried.

When we consider the great need of having our boys overseas well clothed and that we are only raising enough wool to give each of them a pair of pants per year, it is evident they would soon be out of business if they had to depend upon the wool grown in Canada. To clothe them we have to omport approximately 26,000,000 pounds of wool which could be easily raised in this country. It would mean approximately $15,000,000 to the sheep farmers instead of being sent abroad.

Hints re Wool

Don't tubwash your wool; the user does not want it and he can take better care of the washing than you can.

Don't keep the wool in the cellar be fore marketing for you are sure to lose money by having it damp. Dampness causes the wool to be discolored.

Don't leave the tags on the fleece for they will be taken off when it is graded and more wool with them than you would take by clipping before shearing.

Don't tie the fleece with sisal twine; use paper twine only. This can be had on application to the Secretary or Manager of the Canadian Co-operative Wool Growers, Ltd., 128 Simcoe St., Toronto, Ont.

Don't sell your wool to the peddler. If you have not got a grading station near you, send it to the nearest co-operative Wool Association where it will be graded. Remember that the

larger quantity the better the price. 100,000 puonds is worth more per pound than 1.000 lbs. to the wool buyer.

Don't have our boys overseas wearing clothes made of paper and cotton as the Germans have. staying at home and raising wool is doing your bit. Don't depend on yourscf to handle your lamb and wool crop, become a shareholder in the Canadian Co-operative Wool Growers Ltd., and get the assistance of your fellow sheep raiser; it means protection of your markets in the future.

THE ADVANTAGE OF TILE DRAINAGE

(Experimental Farms Note.)

At the Experimental Station, Ste. Anne de la Pocatiere, Que., an experiment on drainage has been conducted the results of which should be of great interest to farmers. as they teach an eloquent lesson in favor of good soil drainage, a practice which should be encouraged as much possible in these days when maximum production is the duty of every farmer.

A certain area of level land was taken for the experiment and divided into two fields, A and B, absolutely similar in every way. Field A was under-drained by means of three-inch tile placed at a depth of four feet and thirty feet apart. Field B was not tile drained but had perfect surface drainage. These two fields were cultivated and treated exactly alike; rotation. cultural methods, manure, choice and quality of seed. etc., being the same in each case.

Close observation has shown that larger yields were obtained on the tile drained area each year than on that which was only surfaced rained. The difference was rather small the year following the laying of the tile, was larger the following year and became quite marked the third year. It was most marked among crops like corn which require more warmth. In 1917 the crop of corn on the drained field was more than twice as great as that on the undrained field. the exact difference be ing 108 per cent. wheat yielding 72 per cent more and hay 20 per cent. It might, however, be noted that the fact that the eason of 1917 was exceptionally late and damp gave a special advantage to the drained area and the results might not be so marked in a normal year.

The difference in crop yields, however. is not the only point in favor of tile drainage, there are other good effects also. After three years the experiment has proved that the soil on the tile drained area has become much more porous and more mellow than the soil which was only surface dra.ned. It can be cultivated more easily and can be worked and sown earlier in the spring. It will be readily seen that this is of great importance in Eastern Quebec where the springs are often late and the growing season relatively short. Beside this, while the soil on the undrained area dried and cracked. allowing the crops to make hardly any growth during the dry weather in July. the drained land did not show the least cracking, and the plants continued their development uninterruptedly. This difference is easily explained; the drained soil was left permeable to air and moisture, the air circulated freely and the moisture rose by capillary action without difficulty through the subsoil to the roots, while the undrained soil hardened and split, and the roots withered for lack of air and moisture.

PASTURE FOR HOGS.

The feed situation confronting the swine grower during the coming summer is not altogether a bright one. Standard hog-feeds are not likely to be plentiful, with high prices ruling. Shorts and middlings, while fixed as to price, show no likelihood of a surplus. Corn, for some months practically unprocurable, and in any case too high in price to be considered,—may be available, but whether in reliable constant quantities remains to be seen. Barley will be high priced also and difficulty available in many localities. Oats, under ruling and probable future prices, should be used only for the milking sow and for weaned and growing pigs. Only in small quantities should this feed enter into the fattening ration. It has been shown that with breeding stock, whether during winter or summer maintenance, cheap home grown feeds may be largely utilized as an economy and that from such feeding practice best results may be obtained in health and production. It has been, further, clearly demonstrated, that home grown feeds for summer feeding may economically replace a considerable percentage of meal even at pre-war prices.

At the Experimental Farm, Brandon, it was shown by experiment during the summer of 1916 that oats, barley and wheat all stood pasturing well. These were sown on May 17 and pastured from July 5th until early in August. Rape, which was slightly injured by pasturing too early, supplied much needed pasturage when the cereal seedings had been eaten off. Vetches although slow of growth, were readily eaten and stood pasturing well. Sweet clover, was also late in maturing and eaten only when no other feed was available.

It might be stated that beyond a comparison of these crops from the standpoint of palatability, recuperative power, and ability to withstand trampling and pasturing generally, no data was available to show the cost of production one crop against the other.

With these pasture crops a self-feeder was used to supply a supplemental grain ration. Such practice indicated that no more than where hand feeding was employed and that economical gains were made at a cost of 5 cents per pound for grain and pasture, employing feed prices then cur-

CANADA

Military Service Act

Important Announcement to All

EXEMPTED MEN

and to the Public Generally

IN dealing with the very large number of claims for exemption brought forward for consideration in connection with Class 1 under the Military Service Act, it has occurred, as was inevitable, that as a result of false statements and difficulties put in the way of investigation, some individuals have secured exemption whose proper place is in the Army.

It is not the intention of the Government to allow these men to evade permanently their obligation to bear their part in the military defence of the Country and of the ideals for which we are fighting. To do so would defeat the purpose of the Act, and cause grave injustice to men in the second class necessarily called out to fill their places.

Exemptions Granted on False Grounds

It is, therefore, proposed to scrutinize carefully all exemptions granted to date in order to separate those which have been granted on false or insufficient grounds from those that are well founded.

With this object in view the various Registrars under the Military Service Act have been instructed to issue a series of questionnaires to exempted men. These questionnaires must be filled up correctly and returned promptly under penalty of forfeiture of exemption for failure to do so.

Exempted Men Who Have Changed Address

It is therefore important in their own interest that all exempted men who have changed their address since their exemption was granted and who have not already notified the Registrar of such change should notify him at once. Under the Regulations it is the duty of exempted men to keep the Registrar advised of any change of address, and failure to receive the questionnaire by reason of neglect of this duty must be treated as equivalent to failure to return the questionnaire after receipt.

Citizens Urged to Assist

In many instances information has been furnished by members of the public which has led to the cancellation of exemptions obtained by false or misleading statements. Further co-operation of this character is invited. The Government regard it as the Duty of all loyal citizens, not only to the Country, but to the men at the front, to assist in this way in securing reinforcements on a just and legal basis. Correspondence of this character will be treated as strictly confidential and will receive the fullest investigation.

CHARLES J. DOHERTY,
Minister of Justice.

Correspondence should be addressed to the Registrars under the Military Service Act.

W. A. Ewing, K .C. Registrar under the Military Service Act, St. John, N. B.

E. Hart Nichols, Esq., Registrar under the Military Service Act, Halifax, N. S. 402

rent. The method in general reduced the labour of feeding to the minimum.

At the Experimental Station, Lacombe, where swine feeding enters largely into live stock operations, rape and alfalfa have proven most desirable crops. As a result of the average of three tests, rape has shown a slight superiority over alfalfa requiring 3.8 pounds meal fed supplementally as against 3.83 pounds in the case of alfalfa. Rape carried 1786.1 pounds of pork per acre as against 1518.9 pounds with alfalfa.

The findings at Lacombe would warrant the recommendation of alfalfa for early pasture with a block of rape to supply green food for hogs when they attain considerable size. Where alfalfa may be successfully grown, the swine grower would be well advised in retaining a small block for swine feeding purposes. Failing alfalfa, clover will give almost equally good results. With neither of the legumes available, results at Lacombe indicate that a cereal pasture second only to the legumes, is to be obtained by the use of a heavy seeding (3 bushels per acre) of oats and barley, or wheat, oats and barley.

Any one of the pastures above mentioned should be followed by rape seeded early in June, preferably in drills 27 inches apart.

At Lacombe the results of the use of self-feeders versus hand-feeding on pasture, while not sufficiently verified by repeated experiment, would indicate that where hogs are fed to a finish the self-feeding method shows most economical gains. It has been proven where corn is the principal grain used, self-feeding is more economical than hand-feeding. That this is also the case where mixed grains, wheat by-products and feeding concentrates are used, is indicated by the results at Ottawa, Lacombe, Brandon and elsewhere on the Experimental Farms System.

At the Experimental Station at Lethbridge excellent results have been obtained from alfalfa and peas, the hogs being allowed access to both crops at the same time. Here of course alfalfa is one of the most dependable crops grown, conditions being in all respects suited to its culture.

While much evidence is, therefore, at hand, to show that alfalfa possibly holds first place as a hog pasture, it must be remembered thmat in many sections of Canada this crop cannot be grown at all, in many others that it is unreliable in the extreme, and that even under more or less favorable soil and climatic conditions for one reason or another it cannot always be relied upon. For reliability and wide cultural possibilities and from the standpoint of palatability, producing power and resistance to pasturing, red clover should receive emphasis equal to, if not greater than, that given alfalfa.

In conclusion, high priced grain and meal for hogs must be replaced, as far as possible, during the coming summer. Pastures, as discussed, form a home grown, palatable, easily available food, that is harvested without labour. The self-feeder combines well with pasturing, and for growing and finishing hogs is peculiarly worthy of attention during present labour scarcity.

PACKING AND SHIPPING APPLES

When labour is as scarce as it is at present, the employment of the inexperienced is unavoidable. Hence "Notes to Beginners", given in Bulletin No. 2 of the Fruit Commissioners Series entitled "Modern Methods of Packing Apples," become of prime importance. These notes run:

1. Learn to size your fruit accurately and the placing in the box is a simple matter.

2. All apples are placed in the box in the same relative position. It cannot be impressed too strongly upon beginners that all sizes and shapes of apples can be properly and conveniently packed in the standard Canadian apple box.

3. Successful packing can only be done with apples of a uniform size in each box. There is no possibility of using an apple larger than the size being packed, and then attempting to straighten the row by using a small apple next to it.

4. Cleanliness cannot be too strongly insisted upon in every feature of box packing. Fingermarks upon boxes, or careless rubbing in of moisture and dust, are all too common. The most scrupulous attention should be given to the fruit and all specimens rejected that are not absolutely free from contamination of any sort.

5. Should there be any dust or spray material upon the apples when picked, it is much easier to take it off at that time. If the apples are allowed to stand, they acquire a certain gumminess that renders it difficult to make them look clean.

6. Packers should keep their nails well trimmed, otherwise injury is frequently caused by puncturing the fruit handled, resulting in decay. In the Western States packers are required to wear white canvas gloves.

These notes are a small part of a bulletin comprising 62 pages, with many illustrations, that is designed to profit the packer and shipper, help the dealer and please the consumer, and that can be had free for the mere act of writing to the Publications Branch, Department of Agriculture, Ottawa.

ECONOMY

is one of the "built in" advantages that make this home-size Electric Lighting Plant supreme.

"Permanency for continuous long service.
"Current capacity for both light and power.
"Efficient for general utility purposes.
"Saves time and trouble.
"Reduces fire hazards to a minimum.

SIMPLICITY

was the keynote of the Northern Electric Engineers when designing it. The Engine, Generator, Switchboard and Storage Batteries are conveniently arranged into a compact single unit plant, eliminating all unnecessary frills and complication—a child can look after it.

"A TURN-OF-A-SWITCH STARTS IT"

Northern Electric Farm Lighting Plant

WOULD you not like electricity in your home? Then why not stop right here to investigate the Northern Electric Farm Lighting Plant, that has taken the pick of skillful Engineers years to produce? It is constructed with the same care, the same exactness for permanence as are the great plants that supply electrical current to big cities. This is the kind of value we are offering—a strictly modern plant which carries a fair and square guarantee.

NOW, here are the Cheerful, Labor-Saving, Economical Features of Electricity:

CHEERFUL, because it is a happy light: good for the eyes, clean, safe, convenient and brilliant.

LABOR-SAVING, because you have no lamps to carry nor wicks to trim. It furnishes cheap electric power for a toaster, iron, washing-machine, warming pad, coffee percolator, vacuum sweeper, and in many other ways helps the women-folks in their work by supplying sufficient power to do light domestic chores. It enables you at the same time to utilize the power of your engine to pump water, saw wood, run separator, grinder, etc., etc.

ECONOMICAL, because it does all this at a small cost of but a few cents a day. It obviates the use of both matches and coal oil lamps, thus reducing the danger of fire to a minimum.

THE NORTHERN ELECTRIC FARM LIGHTING PLANT
will provide electric light and power in ample capacity for

THE FARM,
COUNTRY HOME
COUNTRY STORE
COUNTRY CHURCH
TOWN HALL
TOWN GARAGE
COUNTRY HOTEL
TOWN LODGE-ROOM
RAILROAD AND MINING CAMP
RAILROAD STATION
SUMMER CAMP

Suppose you make yourself, your wife, and your sons and daughters a present of this city COMFORT. It brings contentment to the young folks, and keeps them on the farm. Remember, you can make your home the most desirable of all farm homes at a comparatively small outlay.

The Northern Electric Farm Lighting Plant comprises the Generator, Switchboard and Storage Batteries, but if you prefer, we supply a convenient and compact single unit plant which includes a thoroughly reliable engine, burning either gasolene or kerosene.

Just write your name and address on the coupon provided and mail to our house nearest you for free descriptive literature.

CONVENIENCE AT MEALS - EASY IRONING - RUNNING WATER - RUNS VACUUM CLEANER - LIGHT IN GARAGE - MAKES CHORES EASY - RUNS SEPARATOR - LIGHTS BARN

The Frost "Tight Lock"

Unlike Any Other

Right at the beginning, please remember that FROST fence is unlike any other woven fence.

FROST fence is exclusive in design. Its lock is different. Its wire is different. Its galvanizing is different. The weaving of the fence is different. It's the combination of all these that makes

Frost Fence First

The Frost "Waved" Laterals

The FROST lock is unique in construction. It doesn't look like any other fence lock—and most fence locks are similar as peas in a pod.

The FROST lock will stand strains that will loosen and often pull other locks to pieces. Look at it yourself and see how much more substantial and secure the FROST lock is.

Then look at that special FROST "wave" in the laterals. This long and deep wave gives a wonderful degree of spring and reserve power to FROST fence. It puts real backbone in the fence.

The stays on the FROST fence are straight and stiff and the spacing is accurate. Our special looms weave FROST fence more slowly and consequently the fence looks neater and better in the rolls, and stretches up straight and true when putting it up. It is a fence the farmer is proud to show to his neighbors.

By making FROST fence complete in our own mills we are able to produce a fence that will outlast all others. We put the quality in the wire, in the galvanizing and in the weaving that puts FROST fence in a different class as compared with the ordinary woven fences made of common commercial wire. You can see the difference by comparing FROST fence with others.

You can prove it to the hilt by seeing FROST fences that have been defying wear and tear on Canadian farms for years. There must be some FROST fences in your locality, for we have dealers in almost every part of the wide Dominion. If you don't know the name of a nearby one, write us.

A style for every purpose.

ECONOMY IN LEATHER

War demands leather—leather for soldiers' shoes, lather for harness, leather for equipment of many kinds. In this country there is no such surplus that we can afford to waste any of it; and it is wasting leather not to care for and preserve it properly. In the army and out, we all wear shoes. If we manage them rightly, they will last longer, we will not need so many new ones, and there will be more left for others. The following suggestions from the Leather and Paper Laboratory of the United States Department of Agriculture can be utilized by everyone who walks.

To Save Shoes

Shoes should be oiled or greased whenever the leather begins to get hard or dry. They should be brushed thoroughly, and then all the dirt and mud that remains washed off with warm water, the excess water being taken off with a dry cloth. While the shoes are still wet and warm, apply the oil or grease with a swab of wool or flannel. It is best to have the oil or grease about as warm as the hand can bear, and it should be rubbed well into the leather, preferably with the palm. If necessary, the oil can be applied to dry leather, but it penetrates better when the latter is wet. After treatment, the shoes should be left to dry in a place that is warm, not hot.

Castor oil is satisfactory for shoes that are to be polished; for plainer footgear, neat's foot, fish oil, or oleine may be substituted. If it is desired to make the shoes and boots more waterproof, beef tallow may be added to any of these substances at the rate of half a pound of tallow to a pint of oil. The edge of the sole and the welt should be greased thoroughly. Toc much grease cannot be applid to tnese parts.

A simple method of making the soles more durable, pliable, and water resistant is to swab them occasionally with linseed oil, setting them aside to dry overnight.

Many of the common shoe polishes are harmful to leather. All those which contain sulphuric, hydrochloric, or oxalic acids, turpentine, benzine, or other volatile solvents, have a tendency to hardn the leather and make it more liable to crack.

It is poor economy, too, to wear a shoe with the heel badly worn on one side. This throws the shoe out of shape and may soon result in its ruin. It is also likely to cause temporary injury to the foot.

To Preserve Harness

Harness leather, like shoes, cannot be neglected without injury that lessens its durability. It should be washed and oiled frequently. The washing should be done in tepid water with a neutral soap and a sponge or stiff brush. After rinsing in clean tepid water, then harness is hung up to drain a little while before oiling.

For driving harness, neat's-foot of castor oil is best, but for heavy harness there may be some tallow in the oil. The applications should be light for driving and liberal for heavy harness. The oil, warm to the hand, is rubbed thoroughly into the leather while it is still wet from the washing. Excess oil which the leather is unable to take up should be removed with a clean, dry cloth.

SWAT THE FLY BEFORE IT IS BORN

The most important thing to control the fly nuisance is to swat the fly before it is born. Clean the stables and yards and keep the garbage cans covered. The following are very convenient and effective fly poisons:

Bicromte of potash, one dram in 2 ounces of water. Add a little sugar. This mixtue is not dangerous to human life.

One teaspoonful of formalin in ¼ pint of water. This must be kept away from children and house pets.

To quickly clear a room where there are many flies, burn pyrthrum powder and sweep up the flies.

Thorough Tillage for Greater Production

Tillage, or stirring of the soil, is one of the simplest and commonest of farm operations. Possibly that is why it is so little understood. No one knows just when man began to assist nature by the use of tools to improve the soil. We know, however, that the early implements used for the purpose were crude and that the soil was little more than scratched by their use. The first real impetus given modern tillage had its orogin with Jethro Tull who, in 1733, in his book, "New Horse Hoe ing Husbandry," set forth his ideas regarding the value of simple tillage for the purpose of 'fining' the land. Tull and his disciples believed that plants absorbed the fine particles of earth by means of their roots, and that the finer the soil was pulverized the greater the ease with which the plants could feed and thus grow larger and more productive.

Many farmers know that a well-till ed field will produce a larger crop than one poorly tilled, but cannot tell why. It is now known by those who have given attention to and studied the subject that plants do not absorb the earthy particles, but use only the soluble substances such as are dissolved by the water in the soil. Hence, we stir the land to assist the soil water and air to more readily do their work.

The Seed Bed.—The primary object of stirring tbe soil is to prepare it to receive the seed. In the wild, seeds fall on untilled land, and Nature is satisfied if one seed in a thousand which she periodically sows brings forth fruit. Man requires a larger increase. He can secure it by placing the seed in tilled land and making the condition of the soil bavoroble for the germination of the seeds and the growth of the plants.

Seeds require heat and moisture for germination. The sun and air supply the warmth. The moisture comes from the soil. A small seed sown among the coarse lumps of a poorly tilled field cannot obtain the necessary moisture. The soil should be fine enough to pack closely around the seed and touch it on all sides. This contact will moisten the seed, and assist and hasten germination. Cultivation of a crop after it is sown can never fully make up for lack of it previous to sowing. Farmers, too often, content themselves with ploughing and then harrowing the soil once or twice before seeding, when three or four harrowings and once or twice over with the roller or clod crusher would have paid. The number of times which it will pay to harrow will depend upon the texture of the soil; a sandy loam will not require as much work to prepare it properly for the seed as a clay loam. Get the soil into a good state of tilth, and a better harvest will be the reward.

Tillage Increases Available Plant Food.—The tiny rootlets of a young plant aro delicate and must quickly find noourishment. They will be better able to reach out and secure food in a well pulverized soil. The tillage necessary to fine the soil admits air, promotes weathering, hastens the chemical changes which make available the elements of fertility, and encourages the development and activities of the beneficial bacteria in the soil.

Conservation of Moistrue.—Crops that can be tilled during their period of growth should receive special attention, for they are usually those which reuqire much moisture. Corn and roots are in this class. The surface of the soil should be kept loose and no moisture-losing crust alloweed to form. The surface or dust mulch prevents soil moisture from being lost by keeping it from coming into contact with the moving air, just as a blanket placed over a heap of moist earth would help to keep it moist. Tillage does its work in many other ways, but perhaps enough has been said to give a fair idea of its objects and principles.

The Plough.—Aside from crumbling the soil, the chief objects of ploughing are to destroy wild plants so that cultivated ones may take their place; and to bury trash, manure, stubble and potato vines. A plough that does not accomplish these things is faulty. All refuse should be completely covered so that it will not be brought to the surface by the harrow. To bury weeds clover or other tall green manure crops, a chain should be used, one end attached to the plough beam, the other to the double tree thus allowing the loop to pull the tall palnts down into the furrow to be covered. The jointer or skim-coulter is little used in the Maritime Provinces. Many farmers do not even know what it is. When manure, stubble or grass is to be turned under, it is a very useful attachment. It skims a shallow furrow slice and deposits it in the bottom of the furrow where it is covered by the main furrow slice and will rot more readily. When stubble or grass is ploughed without a jointer, there is likely to be a line of it between the furrows which interfere with the harrow or begins to grow and cause trouble. This is a common sight in the Maritime Provinces, but could, and should be over come by the use of the jointer. The implement dealers could perform a distinct service to agriculture by encouraging the general use of jointers on ploughs. There should be one on every farm.

It is well to have various types of ploughs for the various kinds of land to be ploughed. This costs more, but greater efficiency results. A sod plough will not do good work in soft stubble, nor will a stubble plough perform well in a stiff sod.

Depth to Plough.—The depth to plough depends on conditions. As a rule, the heavier the soil the deeper it should be ploughed, and generally, fall ploughing should be deeper than spring ploughing. Most field crops feed more deeply than is commonly realized. Therefore, the deeper the soil is ploughed, within certain limits, the greater will be the feeding ground provided for the roots. There has been a tendency in some quarters during recent years towards shallow ploughing. It is desirable under certain conditions, but should not be carried too far, or bad results will follow. The depth of ploughing is a question which every farmer must study for himself. If he wonders what would result from shallower or deeper ploughing than he commonly practices let him plow one ridge shallower, or deeper, and carefully observe the effect on the crop. In this he must not be influenced by the result of one year's trial; the experiment should be repeated year after year and on various types of soil on his farm, always taking into consideration seasonal conditions.

The Disc Harrow.—One of the best tillage tools yet devised is the disc harrow. tI is especially useful in pulverizing the soil in the spring after fall ploughing. To put a piece of fall ploughing in best shape by the use of the single disc it should be 'lapped half.' The tendem disc, one in-throw and one out-throw, which is now coming into more general use, is an excellent tool and performs the work of two single discs and does it better providing plenty of horse-power is available. One man handles it where two would be required if two single discs were used, and important consideration when labor is scarce.

Smoothing Harrows.—When the soil has been pulverided with the disc and it is desired to leave it smooth, or when mellow soil has just been ploughed, the smoothing or spike harrow may be advantageously employed on account of its lighter draught and the wider area covered. It is also a very efficient weed killer when used on corn and potatoes after they have been planted. It may be used before and after the plants come up. If corn is to be harrowed, it should be planted slightiy thicker than usual; and, if planted in drills, it should be harrowed crosswise of the rows. If potatoes are planted shallow, they are likely to be pulled out of the rows. Judgment must be exercised in harrowing crops after they are planted or sown. A light harrowing of grain crops after they are three or four inches high is often beneficial. This canot be done, however, if the crop has been seeded with clover and grasses. A light harrow should always be used on crops. The light tilting harrow is particularly suitable for this purpose as it can be set with teeth sloping backwards so as do little injury. Weeds are most easily killed when they are very small or have just germinated, hence harrowing and early and close cultivation are necessary if the fields are to be kept scrupulously clean.

The Roller.—The roller is useful to crush clods and to compress the furrow slice after ploughing sod. When manure or green crops have been ploughed under, a roller is needed to compress the soil and eliminate the air spaces under the furrow slice, which would have a tendency to dry out the top soil. The roller is sometimes used after the drill to make the soil smooth. This is not a good practice, as an unnecessary loss of soil moisture is likely to occur. The roller should be followed by the smoothing harrow to leave a surface mulch. A light roller may be used to advantage at times on a drilled field two or three weeks after the drilling to break the crust which may have formed and to level the ridges left by the drill. The rolling of heavy coils when they are wet should be avoided. The soil may be too closely packed and the air excluded, which would interfere with germination.

After-Harvest Summer Cultivation—By this is meant the ploughing and cultivating of land immediatetly after the crop has been taken off or after it has been pastured up to the middle of summer. The usual method is to skim plough very shallow, roll and disc, or otherwise cultivate in the expectation of ploughing again two or three inches deeper in the fall. This has been found to be useful in the suppression of weeds, in the conservation of moisture and in the increasing of crop yields. When a field has become badly infested with weeds, the shallow ploughing and packing in the warm weather rots the sod and the subsequent tilling causes the seeds in the soil to germinate and also kills the young plants. Moisture is retained under the surface mulch formed, which helps to rot the sod and other litter. When the fall ploughing is done, this surface soil and rotted sod is placed where the roots of the next crop can best make use of it and the two or three inches of soil turned up by the deeper ploughing makes an excellent seed bed. Actual tests have shown that good profits have been made in cleaning land and in increased yields, even when allowance has been made for the extra labor. Less time is required in the spring to fit the land for crop on a field so treated.

Drainage.—Many suppose that land drainage is concerned only with carrying off excess water from very wet soils, but it does more than this. It improves soils that are shallow or in poor texture, or slightly wet. By carrying away excess water, it permits of earlier work on the land in springtime. By lowering the water-table, the air and rainwater penetrate to a greater depth, thus making a shallow soil deeper and affording a larger feeding ground for the roots of plants. The texture is improved by the weathering and the chemical and bacterial action consequent upon the admission of the air and rainwater. A drained soil will hold moisture better and withstand drought much better than undrained soil, because the roots have penetrated more deeply and can draw upon the supply below the surface. Very little of the land in the Maritime Provinces is under-drained. Much of it would be vastly improved thereby. Dig a few holes and study the sub-soil. If drainage is decided upon, be sure that a suitable outlet is available. Complete information regarding drainage may be secured upon application to your local Department of Agriculture.

Feed Situation in 1918 Will be Acute

Agricultural Societies Desiring Mill Feeds in Car Lots Should Get Busy and Prepare Orders at Once

The Maritime Farmer recently sent a representative to Ontario and Quebec to investigate the feed situation for 1918. The outlook is not at all promising. In the first place there will be a big reduction of bran and middlings consequent to the new flour regulations which compel millers to use a higher percentage of wheat in the production of flour. Then there is a regulation which provides that all feeds ground west of the Great Lakes shall be sold in the prairie provinces. The result is that much feed which formerly came to the Maritime Provinces is being fed in Manitoba, Saskatchewan and Alberta. Besides shortage of feeds there has been a marked falling off in the supply of corn. This is largely accounted for by the lack of cars to handle the big United States crop of 1917. However, considerable corn is now moving on the rails and this will be used in the manufacture of standard feed to be made up in the mill feeds, corn, oil cake and other ingrefients.

The Maritime Farmer representative visited mills at Chatham, London, Peterborough, Toronto and Montreal and found them all over-sold and farmers vainly endeavoring to get small uantities of feed. Farmers drove miles to get three or four bags of mill feeds and seemed to be satisfied if they could only get sufficient to keep the stock decently fed.

The Maritime Farmer arranged with two of the largest mills in Canada to take any surplus bran or middlings that might be available. This feed will be supplied through Agricultural Societies at cost. The prices will be fixed by the Food Controller but to ensure delivery it is necessary that the orders be placed not later than June 15th, and earlier than that if possible. The early bird will get the feed worm in 1918.

Bran and middlings in the barns and store houses will be worth their weight in gold next fall. The Maritime Farmer desires to assist farmers in getting their stock but the outlook for 1918 is far more serious than that of 1917 and farmers who have been trying to buy feeds will realize what that means. In many sections of the Maritime Provinces co-operative buying saved farmers as much as $250 a car. The Maritime Farmer is giving this feed service to Agricultural Societies, the members of which are subscribers to the Maritime Farmer.

If you are interested in the proposition write the Maritime Farmer at once. Do not delay until next fall.

It is only fair that farmers buying feeds in car lots should also buy their flour from mills that supply them at wholesale prices. It is absolutely unfair to expect the mills to supply straight feeds and then give orders for flour to mills which refuse to deal at all with the farmers direct.

If you are wise you will not lose a minute in having your Society line up and gets its feed orders ready for 1918.

The Maritime Farmer can supply order forms suitable for getting orders at 65 cents a hundred.

The Dawn of a New Era in N. B. Cheese Making

On Friday, April 5th, a meeting was held in the Agricultural School, Sussex that omens well for the future of the cheese making industry in New Brunswick. The meeting was in the nature of a get-to-gether conference of milk producers, cheese factory directors, cheese makers, brokers, cheese buyers and sellers and experts who know what is what in cheese making.

It is a well known fact that cheese making has not reached the stage of perfection in New Brunswick that has been obtained in other provinces, and consequently the home demand for this excellent food commodity has been filled in the main from outside sources.

H. N. Flewelling, B. S. A., presided. Among those present were W.R. Reek, Deputy Minister of Agriculture; Geo. Barr, of the Dairy Division, Ottawa; H. W. Coleman, the new Dairy Superintendent for the province; Harvey Mitchell, one of the foremost cheese experts in Canada; G. B. Pippey of the Nova Scotia Dairy Division; R. B. Colwell, Cheese Broker of Halifax, N. S.; C. W. DeForest, T. B. Schofield, D. W. Puddington, A. C. Cross and J. A. Gundy, St. John; and H. W. Robertson, Moncton.

Some good cheese has been made in New Brunswick, several factories have a reputation for making a first class product, other factories have not such an enviable reputation. Too often the good product of the more careful factories has to bear the drag of the stigma and unenviable reputation of the careless.

The outcome of the recent meeting will be that merit will be recognized where merit is due. The careful makers will be able to dispose of their product at the highest ruling prices and the careless will find it increasingly difficult to find a market that will take their goods at any price. The chees edealers of the Maritime Provinces are ready and willing to give the Maritime made cheese the preference providing the quality is all right.

There was no shielding or glossing over of conditions as they exist. We heard a cheese broker say last summer to a group of cheese makers. "I will give you several cents per pound more for your cheese than you are now getting if you put up as good a quality as they do at P————, and I will guarantee you a steady market."

Several factories resolved to aim for a higher standard in their products and the result was quite noticeable. They made a start on the right road and they are determined to continue in the path of improvement.

The first speaker was Mr. Barr, who is one of the foremost cheese experts in Canada. Last summer he visited a number of factories in this province and found that steps should be taken at once to improve the grade of cheese made. In the course of his address he used four cheese for demonstration purposes; one to represent the imported product from Ontario; one to represent what was done in some of the factories in New Brunswick last summer through a little special effort; and the others to represent the result of carlessness and inefficiency or lack of knowledge of the consequences of improper handling of a product that is highly perishable when not properly made.

The cheese before the meeting were cut and sampled by those present with the result that everyone admitted that the Ontario cheese was quite superior. The other two were cut but sampling was declined be cause they were unfit for human consumption, and it was clearly explained that there was no just cause why every cheese should not be equal to the Ontario cheese shown.

The loss in profit to the producer was easily seen, and at this time the loss in food made it appear criminal. Mr. Barr pointed out that it was a severe handicap to retailers when endeavoring to cut the inferior article, as consumers would discriminate very decidedly, first because of appearance, and secondly because of flavor.

Letters were read from firms who found it impossible to be represented at the meeting, stating that the quality of the New Brunswick cheese had gone so low that they would be forced to refuse them, even though it would cost three or four cents a pound more to import the cheese from Ontario. Thus the New Brunswick farmer was losing a fair profit by following the present methods.

Harvey Mitchell, of the Dominion Dairy Division, pointed out that the best New Brunswick cheese exhibited at the meeting was made in a factory last year where an effort had been made to produce a better article which resulted in the satisfaction of the producer and the consumers. He alos explained, spported by the makers present, that every competent maker was aware, that when the cheese was a day or two old, it would show signs whether or not it waas superior or inferior.

The delegation of the merchants present were unanimous in the point that they were finding it more and more difficult to dispose of cheese made in this province because of its lack of quality and uniformity.

Several stated distinctly that they did not intend to handle and further quantities unless suitable supervision would be given to guarantee a standard product.

It has been suggested that in the proper carrying out of th eproper propaganda, that a cheese board should be established in order that satisfaction might be given to all concerned.

It is hoped that as a result of the bringing to gether of these varied interests that the New Brunswick cheese will before long compare very favorably with the best cheese made in Canada, and that the New Brunswick consumers will have the satisfaction of spending their money in their own province, knowing that they are securing an article equal in value to that which is today being imported; and as a result every producer will also know that under the gradual improvement which should take place he will receive a greater return for his labor.

The provincial department of agriculture was pledged by Mr. Reek to give the necessary technical instructions to bring about this improvement.

After considerable discussion it was decided that if the factory men were willing, a grading system be inaugurated and that all cheese would be sold upon its merits. The dealers stated that if such could be done they would purchase only graded cheese from this province, the grading to be done by the Dominion department of agriculture.

A meeting of all the factorymen will be requested and the dairy superintendent of the province will be present to discuss the situation with them.

H. W. Coleman, the new Dairy Superintendent, expressed his willingness to do all that lay in his power to assist in this movement.

The new Dairy Superintendent for the province, H. W. Coleman, of the Dominion Dairy Division, has been engaged to fill the vacancy caused by the untimely death of C. W. McDougall. Mr. Coleman comes highly recommended from the Dominion Dairy Division, with which he has been connected for the last eight years. Previous to this he was a very successful cheese maker, and is a graduate of the Guelph Dairy Svhool. He also holds an associate diploma of the GuelphAgrricuitural College. Mr. Coleman has long been known as a keen student of agriculture and also of men in general, and it is anticipated that under his direction the dairy industry of this province should be greatly benefited.

Reduce Cost and Increase Production on Farms by Use of Modern Appliances

The addresses delivered at the recent Farmers' and Dairymen's Asoiciation by W. R. Reek, Secretary for Agriculture and Prof. Grisdale, Director of Experimental Farms, urged the necessity of using more power and larger machines to cope with the shortage of man power on the farm.

At the present season there seems to be no other way of reducing the cost of production on the farm, than by bringing the man power up to the highest point of usefulness in adopting the most efficient tools, implements, machinery, devices, &c., and operating them as far as possible, by wind, gasoline, steam or electric power. Owing to the shortage of men for farm work, production will be greatly diminished, unless one man is enabled by the use of better equipment, and the more general adoption of the above mentioned powers to accomplish very much greater results. Even some of the seemingly insignificant things about the place may be used to facilitate and render much of the work easier and more agreeable; all of which tends to accelerate matters and enlarge the total crop yield and income of the farm.

Working out this idea on a practical basis, there is no doubt that there are many farms where larger and more expeditious implements should be used. On many large farms, the need of some good economical power could be pushed to extreme length, has been felt for many years. This has apparently been supplied in the recent introduction of the Light Farm Tractor, capable of drawing a gang of plows or other expeditious implements of cultivation. This machine will not tire like the teams and can be operated twenty-four hours a day if necessary, which under certain conditions is a great advantage. In addition to its value as a field machine, it can also be used for work around the buildings, cutting ensilage, chopping grain, sawing wood or any other work requiring light or medium sized power.

Again the larger, heavier and faster horse-power machine should be more generally used than they are. One

man can drive three or four horses about as well as two, and thereby multiply the amount of work he is able to accomplish in a given time. On most hundred acre farms at least four horses are kept. Where there are two men and large implements one can use all the horses allowing the other to do the chores and other work, thus keeping all departments of the farm up to an economical working basis at the same time securing a maximum amount of work from the teams, without having a lot of drudgery to do when the day's work should be over Where there is only one man the advantage will be still greater for he can even then do the work of an ordinary day in one half and have the other half clear for other jobs. Large implements will not only be found of advantage in the spring for plowing, seeding, etc., but the same principle can be carried out largely all the way through the season, with mowers, binders, loaders, rakes and other articles. The manure spreader with three horses on it is one of the greatest labor savers of any machine on the farm. This special purpose appliance is always ready to do its full share of the farm work at a minimum of cost and as an economic source doing certain work it has no superior on the farm. In these days of strenuous exertion where everything possible should be made to increase the output of the field, no farm having any considerable quantity should be without a spreader.

The hay loader and side rake has not come into general use; but no doubt should be found on many more farms than they are. Many for some reason, are still prejudiced against them; but there are others who would not think of parting with them at double or triple their cost. That they are an economical and expeditious means of loading hay cannot be gainsaid. The trouble in most cases with the objectors is that they don't like to hustle; but with s steady team and windrows not too heavy, even these can get on a load with much less exertion than by the hand-pitching method.

Where the hay-loader is used the side rake is almost a necessity to put the windrows in good shape and also in having them follow the mower round the field, making it possible always to work the hay as it is cured. This implement can generally be used to replace the tedder in stirring and turning the hay.

Where a large acreage of corn is raised the double cultivator is a most useful implement. It will do a good job if used properly and not only cut the time of operation in two but at the same time be a much easier task for the workman; and while hand-hoeing cannot be entirely eliminated it can be very greatly reduced

In some parts of Western Ontario the farm truck, with level platform, is becoming very popular in some sections at least. This is made by putting two 3"x6" or 2"x10" sleepers on the bolsters, spiking and fastening good ends on with iron straps going around them and fastening to the sides with bolts. The platform is then made by laying inch boards crosswise and nailing them to the sleepers. A two by three inch strip running all around and bolted to the ends of the platform boards will complete the job all but ladders in front and behind which should be moveable.

Where two farm wagons are kept, and there should be where there are four horses and two men, this makes one of the handiest outfits on the farm. It can be used for drawing almost any kind of farm produce, going to mill, drawing hay, grain, ensilage, and any kind of truck without any changing. And if needed for drawing gravel or such work, the platform can be lifted off, which it will seldom need to be.

In addition to the more pretentious articles on the farm for economizing in labor, many of the so-called little things may be made to play an important part. For instance, a stone-boat can be made by any handy man in half a day for an outlay of one to three dollars that will save many a lift in hauling articles about the farm. Ploughs, harrows and other things caan be so easily loaded that the wagon will not be needed when the boat is available.

A good working outfit of carpenter's tools is indispensable for the farm. No one can afford to run off to town for every little repair that is needed to tools and other farm equipment, and if the boys are supplied with a reasonable outfit they will soon become quite proficient in their use, and not only save many a trip to town, but be able to make many articles of value for the farm equipment.

Another useful little device not commonly found on the farm is a wagon jack. This can be easily made at home some rainy day and will be found much more satisfactory than hunting around the place for an old rail to lift the whole weight by main strength.

For keeping the tools sharp and in good working order few things will be found more useful than the bicycle grindstone. With this inexpensive little implement all kinds of tools, mowing machine sections, etc., can be ground by one man and more satisfactorily than having a boy or lazy man to turn it. On a farm where much hay cutting is done all old sections should be replaced with new ones previous to starting the haying. It will only cost from one to two dollars to put all new sections on a mower knife, and it will pay big dividends if the sections are much worn. The binder is better equipped with sickle sections. Although not quite so keen as fresh-ground smooth section, on the whole it will do better work and need not be taken out of the machine from the beginning until the end of harvest.

A good horse clipper is a fine thing on the farm. It may be either a hand or a geared machine to run with a crank or electricity. When the weather turns in hot in the spring, the teams cannot do much unless their old hair is off. To remove this with the clipper is only the work of an hour or two and it will make a wonderful difference in the amount of work a team can do. Curry combs, burshes and stable fixtures will also expedite matters in caring for the horses and keeping them in good condition for their work. These should be kept in good shape and renewed at least every year, preferably in the fall when the hair gets long. The sharp teeth will be smoothed to some extent by the time the hair is off in the spring. An old rusty curry comb is little better than a chip for celaning a horse. With proper tools one can do this in ten minutes better than could otherwise be done in half an hour with poor tools.

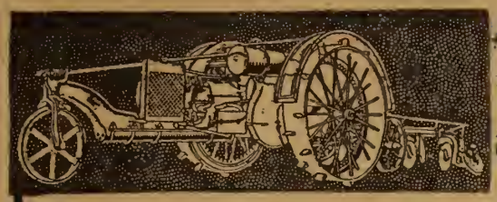
There are many other plans and devices that can be made to conserve economical ends and every farmer should keep his eyes open, and his heart ready to respond to every suggestion along this line and the possibilities of thus reducing the cost of production will increase with the passing days.

PROSPECTIVE WOOL PRICES

Beginning in the year 1914 and continuing on until the year 1917, wool prices have been advancing by leaps and bounds. Take for instance in the year 1914, wool growers received 20 cents per pound and upward, the price depending on how and when the wool was marketed. In 1915 wool marketed co-operatively by the Sussex & Studholm Agricultural Society averaged about 35 cnts per pound. In 1916 a still further advance was registered and finally in 1917 wool marketed early sold for as high as 62 cents and later on in the season reached the 72 cent mark for unwashed wool. This 72 cents for unwashed wool, based on a 25% shrinkage for washed wool, is equivalent to 96 cents for unwashed wool.

Now due to the successive increases of the last few years as outlined above, the wool growers anticipated another big increase in price this year. Undoubtedly prices would have advanced again but the United States War Purchasing Commission, to prevent speculators from cornering the available wool supply, have reserved the right to take all the wool they require at last year's prices, as quoted on the Boston market less 5%. This move on the part of the United States Government was made solely for the purpose of controlling speculators. American prices regulate Canadian prices for the simple reason that two-thirds of the wool grown in Canada is marketed in the United States because the Canadian mills have not the facilities for manufacturing all of the Canadian grades.

How will this effect the New Brunswick wool grower? It all depends on whether the United States Purchasing Commission exercise their prerogative, if so prices will remain steady and there will not be any abnormal advance over last year's prices, but immediately an attempt is made to corner the market or speculate in any way, undoubtedly the Purchasing Commission will act, and from all appearances at present it seems that there will be no material advance over last year's prices.



Turns in its Tracks

Big Results at Low Cost

THE HAPPY FARMER Model B abundantly makes good this claim because it does everything other tractors do, and does it on cheap coal oil.

It pulls plows, drills or harrows, pulls the binder, draws loads to market, or does road grading; it helps saw wood, fill the silos—does every kind of pulling and belt work on coal oil without carbon trouble or smoke nuisance.

If you want early plowing, seeding and harvesting in critical times, make sure of them by using the

Happy Farmer Tractor

Model A—8-16 horse power
Model B—12-24 horse power

Model B's motor is not merely adapted, it is designed specially for kerosene: it is the most perfect kerosene burning motor made.

The Happy Farmer makes good on the heaviest plowing, yet it is light enough for use with the drill. It's great how it gets around in close corners and in small fields. It plows right up close to the fence with every corner finished right. It turns on its own tracks.

With more than 2,000 lbs. draw bar pull, and weighing only 3,700 lbs., model B does not pack the soil in cultivating or seeding. This combination of power with light weight means economy and a less expensive machine all around.

If you prefer a less powerful machine for smaller farm, Model A will meet your requirements.

MAKE YOUR WILL PROPERLY DRAWN TO AVOID TROUBLE

When a man is in good health and his life seems assured for many years to come, he is likely to think, that however much will-making considerations may apply to others, for him at least they have no attraction, and thus a matter that in nearly every case is vital to someone is thrown into the dice box, so to speak, and those to whom right, equity and justice could have been assured, are often forced to become the victims of a game of chance through no fault of their own, and no doubt through the intentions of no one else, but rather through the neglect of such business principles as would not be left for a single moment without the thought and consideration that they deserve in any other line of business conduct. Where the making of a will has been neglected, there is always added cost in the settlement of an estate through following out a course of law, and this is the least of the evil results that often occur.

The law has made certain legislation that embodies some of the features that should be in all wills; but the law or any other force can not make general rules that would be applicable in all cases. Law is therefore not always equity and cannot be, because it can only deal with general principles, which in specific cases are not just.

Any man who has the intelligence and capacity to accumulate property should be in a better position to know how, where and to whom his bequest should be made than anyone else. The injustice of "no will" is likely to fall heaviest where it can least easily be borne. With a man of large wealth it does not matter so much. The laws of the province will insure relatives quite a fair division of his estate after the legal fees are taken out. But the man who has only a modest fortune to dispose of should see that it goes into proper channels. A faithful and loving wife should in many instances have the use of all the estate during her life; in other cases there are aged parents to be provided for, and again children, brothers or sisters who need especial care. These matters can be adjusted only by the provident man who makes his will. No man has a right to presume on life. No sane man will question this fact; then why take chances in the things that cannot be remedied after this chapter is closed? The making of a will is one of these.

Farmers, perhaps, more than other classes of men, are prone to procrastinate along business lines that require a pen and ink to accomplish. The reason is not far to seek. They work on other lines largely and as a rule would rather wield the hay fork with which they are more familiar. While this is good and necessary, a change to the pen frequently enough to keep on familiar terms would serve a good and useful purpose.

Many people have the impression that a high priced lawyer is necessary to a properly made will. This is a mistake. If one can write a legible hand (and most farmers excel lawyers in this matter), knows to whom he wishes to leave his belongings, and can express his intentions in simple, direct words, he is in a position to make a will that will stand the test in any supreme court in the land. In addition to these facts, he will need only to observe a few simple rules, such as the appointment of one or more executors, to subscribe his name in the presence of two witnesses and declare it to be his will in their presence. The witnesses should be persons familiar with conditions, and the will should be placed in the care of some responsible person. The executor should not sign as witness. After the will is made and before it is signed and witnessed, the owner should read it over carefully, and if it is not according to his wishes destroy it and make another. It is better to do this than to make erasures and trust to the consequences, which are often serious.

In making a will it is always good policy to make sure that the law is not being overridden. For instance, the wife can claim certain amounts or interests in an estate and she cannot be deprived of this. Will forms can be secured from various places where they are on sale that aid greatly in the making of a will, as they are printed with headings and other matter to guide one. Forms can be procured that furnish instructions for filling in properly and such other information as will enable the accomplishment of the object in view. In addition to this the Bax will form gives a sample will made to correspond to the form, which makes it almost impossible with ordinary care to go astray. However, if a person is not sure of his ground, it will be better to pay a few dollars than run the risk of litigation.

DEBT ON FARM VERY OFTEN GOOD FOR YOUNG MAN

The farmer has no reason to feel ashamed if he happens to have a mortgage on his farm or carry a debt in some other way. If he exercised good judgment in buying the farm, he probably never did a better thing than when he gave obligations for the deferred payments. We believe that most young men make a mistake if they do not go in debt on starting in life. Nothing will so stimulate them to work hard and be economical as the consciousness of knowing that some time during the year they must meet a due note. If a young man buys a farm and has half the purchase money made to pay on it he might sell half the farm and get out of debt, but this would rarely be advisable. The farm may not be too large. He will make another mistake if in his rush to get out of debt he sacrifices fertility. In order to build the farm up he may have to spend all he makes on it for five years or more and therefore will reduce his indebtedness little, if any, but this should not discourage him. As he increases the fertility of his farm he is increasing his assets, though they may be invisible, just to that extent. A young farmer who owed a big debt on a farm recently said to the writer that he would tile drain it as soon as he got it paid for. He felt that he did not want to go in debt any more. Was this good policy? It is a very conservative estimate that tile drains laid in wet lands will pay a dividend of 50 per cent. or more. He doubtless, is not paying more than six per cent. Instead of paying off a note of $500 and thereby saving the six per cent., would it not be wise to invest that money when it will pay 50 per cent? If he did this at the end of the first year he would have made the interest ($30) on a $500-note and cleared $220 besides, and the next year the land would go on making just as large dividends. The permanent improvement made here would constitute an invisible asset but his creditors could see that he had it and he would strengthen his credit to that extent.

IMPORTANCE OF GOOD SEED

There never was a time when good seed was of such importance as today. First, it is important from the standpoint of dollars and cents caused by the scarcity and high price of labor and the real money value of the seed if used for food purposes, but away and beyond these it is important for the reason that today the gaunt spectre of almost certain famine, on a large scale, in more than one portion of the world, looms up as an ever present nightmare, and, therefore, it is not only the duty, but the privilege of each to, as far as possible, help ward off this pending calamity. We, therefore, urge, with all the power and persuasion we can command, every farmer to be exceedingly careful about the seed he uses this coming Spring.

Increased production is essential. There are a number of ways by which this can be accomplished, but by far the easiest and most profitable is by the use of strong, vigorous seed of high germinating quality. This ensures the largest possible returns with the least labor. To spend a lot of valuable time in preparing the seed bed and then to sow weak seed is, to put it mildly, a waste of energy and to state it boldly, in the light of the present day events, a crime. Weak, frosted seed has real food value, so should be used for that purpose, and not scattered on the land when it will blight your hops, as all it can do is make spindly growth if it has some vitality, and rot without sending forth a blade or root if badly frosted.

* * *

Convenient and efficient systems of watering the cattle, either in the stables or yards save much unpleasant labor and help to keep the cows up to maximum production. Individual watering basins by the side of each cow are a good thing, but they should not be used as an excuse for keeping the cows inside all the time, as they need daily exercise in the yard. It is better to water the cows in the barn in the winter and turn them out for daily exercise. When a cow is kept in a warm barn for twenty-four hours and then turned into the yard to drink from the water-trough, her system requiring a good deal of water, she is apt to drink so much cold water that it will cause a chill that will prove injurious in its effects.

* * *

Preparedness! means that every farm implement and machine be in good working order when the time ocmes to put in the big war crops.

* * *

"He that wasteth today will be hungry tomorrow."

The man who grows more food adds to the wealth of the world; the man who grows dollars may be adding only to his own wealth.

RATS AND MICE

Destroyers of Grain and Food

The brown rat is the worst pest with which man is afflicted. Both this rat and the house mouse came to North America from abroad; possessing habits adaptable to almost any kind of environment, and feeding upon all kinds of animal and vegetable matter they have increased and spread over a vast area. In Canada they have not yet spread over the greater portion of the prairie provinces, but in their gradual migration from the east they have now spread over southern Manitoba, and as the west becomes more settled their destructive hordes will certainly extend further afield, menacing especially the grain interests.

Destruction of Food.—Their destructive powers are well known. No kind of grain is spared, whether growing or stacked in the field, stored in the granary or elevator, transported by rail or water; everywhere they take an enormous toll of this chief source of our food supplies, the conservation of which is a paramount necessity at the present time. Never have the destructive powers of mice been so strikingly demonstratetd as in Australia during 1917. Owing to the lack of transportation, vast quantities of grain destined for export have accumulated in New South Wales and Victoria. A plague of mice developed, and the destruction of grain has been enormous. We are informed that in some places the ravages of the mice were so great that huge stacks of grain were reduced to what resembled mere heaps of debris in a few months. The Wheat Board of New South Wales organized a campaign of destruction; in one place the catch for two nights totalled seven tons of mice. While this outbreak was exceptioial it serves to show the destructive powers of these small creatures, in the mass.

The brown rat invades houses, stores, warehouses, and markets, and besides destroying fabrics of all kinds and leather goods, it attacks all kinds of food: meats, groceries, fruits, vegetables. In town and country it attacks poultry, destroying eggs and chickens The foundations of buildings are damaged by their activities, and everywhere they destroy unceasingly, and yet we tolerate their presence.

In Europe it was estimated, after a full enquiry in 1907, that the average annual loss caused by each rat in Great Britain equalled $1.80, in France $1, and in Denmark $1.20. The losses in rural districts in Great Britain and Ireland in the same year were computed to be seventy-three million dollars, and a capital of about ten million dollars was employed in the industry of supplying means for their destruction. In 1904 the losses in France were computed at forty million dollars. At the present time the English Board of Agriculture is making special efforts to combat the rat pest in England as a means of saving food supplies, and the Sanitary League in France is also carrying on a vigorous campaign against rats.

Recently, Mr. E. W. Nelson, Chief of the Biological Survey of the United States Department of Agriculture, has estimated that the annual losses in the United States due to rats equal at least 200 million dollars. He also states that in order to feed and otherwis provide for this enormous destructive army of rats, the labor of 200,000 men is required annually.

Menace to Health.—Besides the enormous destruction of food supplies, the brown rat is a serious menace to public health. It is carrier of bubonic plague, one of the most devastating of human diseases, which has been carried by the rat all over the world. In the fourteenth century it is estimated that about twenty-five million people died in Europe from the "Black Death" as this disease was called, and 2,000,000 deaths are stated to have occurred during the epedemic of the plague in India in 1907. Bubonic plague is transmitted from rats to human beings by fleas, and modern methods of preventing the spread of plague involve the most vigorous eradication of rats, and the prevention of their landing in seaports from ocean-going vessels by which they are transported.

Investigations into the recent outbreak of infantile paralysis (Polimyelitis), which was especially prevalent in the Eastern United States, have indicated that the rat may be an important factor in the spread of this disease.

Prolific Habits.—The serious nature of the rat menace is more keenly appreciated when their prolific habits are realized. The brown rat begins to breed when it is about three or four months old; they breed from six to ten times a year, and procuce, on the average, ten young in a litter. If we imagine a pair of rats breeding at this rate uninterruptedly for three years without any deaths to their progency, at the end of that period the number would have increased from two to over 350 million rats.

Mice produce fewer young in a litter but they bring forth their families with astonishing rapidity.

How to Protect Grain, and other Stored Products from Rats and Mice

The main reason for the abundance and destructiveness of rats is that we provide ample food and shelter for them. To combat these pests successfully we must deny them these essentials. We must starve them out and build them out.

They should be denied access to places where they obtain food and rear their young. To accomplish this, buildings should be made rat-proof; and the best method of construction for this purpose iis concrete. In the construction and maintenance of buildings in which food is kept and rats are likely to find lodgment, special attention should be paid to the closing of all apertures, especially in foundations where drain and other pipes enter. Doors to such buildings should be bound with strong sheet metal. Constant viligance should be exercised with a view to checking any inroads of these pests; the holes of rats or mice can be readily stopped by a little concrete or broken glass or crockery. Cement should be used for foudnations of all kinds of storehouses, granaries, poultry houses. Corn cribs can be rendered ratproof by inclosing them in heavy galvanized wire nettting of half inch mesh. Storerooms should always be made ratproof by the adoption of the foregoing constructional methods.

So long as old buildings and storerooms are maintained in a state of disrepair, rats and mice will flourish and destroy their contents. It is not only in the interests of private economy, but as a national service, that owners of such rat-infested buildings should take immediate steps to "build out" the rats and save food supplies. Everywhere destructoin is proceeding, and everywhere there is a greater need than ever at the present time for the saving of every bushel of grain and every pound of food.

Civic authorities, and particularly the health authorities, sould adopt and enforce sanitary conditions in towns and cities. Cleanliness and the prevention of the accumulation of refuse and garbage are essential in the eradication of rats. The maintenance of garbage dumps is one of the greatest contributing causes to the abundance of rats. From all points of view the immediate incineration of garbage is the only proper treatment and method of preventing the increase of rats and the breeding of flies, those unsurpassed agents in the spread of infection.

How to Destroy Rats and Mice

Trapping.—On of the most effective methods of destroying these pests is trapping. The best traps are those of the spring or guillotine type. Such traps may be baited with any of the baits preferred by thsee animals, such as meat, oatmeal, cooked eggs or fruit. It is necessary to use a large number of traps, the more the better. The wire cage traps are excellent when rats are abundant.

Poisoning—Where there is no danger of food becoming contaminated, or of fur animals eating the bait, the bait other animals eating the bait, poisoning is a speedy method of destruction. But naturally the greatest care must be exercised in the use of poison. In destroying rats and mice in houses it is inadvisable to use poison, not only on acocunt of its danger, but the occurence of the inaccessible corpses of these animals is likely to prove objectionable. Barium carbonate is a cheap tasteless, and odorless poison. It may be mixed in dough or composed of four parts of meal or flour and one part of the poison, or a stiff dough of eight parts of oatmeal and one of poison. The poisoned dough should be placed in the runways of the animals. Strychnine is a well- known and rapid poison, usually used in the form of strycnine sulphate. The dry crystals of this chemical are inserted in baits, such as meat or cheese. With oatmeal or grain, such as wheat or corn, it is used in the form of a syrup which is made by dissolving half an ounce of strrychnia sulphate in a pint of boiling water; a pint of thick syrup is added, and the whole mixture is stirred thoroughly. Oatmeal should be moistened with the syrup, and grain should be soaked over night. Arsenic is used in most rat poisons. It may be fed in the form of powdered white arsenic, used as described above. A good bait is prepared by thoroughly mixing a pound of oatmeal, a pound of coarse brown sugar, and a spoonful of arsenic. This is placed in the runs of the animals. Phosphorus is a common ingredient of rat and other animal poisons, but owing to the danger involved in mixing it and in the subsequent use of the home-made or commercial preparations on account of its very great inflammability, its use as a rodent poison is not recommended.

The value of domestic and wild animals as rat destroyers.—The great value of small terriers as rat-catchers is too well known to need emphasis. They are often used in conjunction with ferrets, the latter animals being employed to drive the rats from their runways. But ferrets should always be muzzzled when hunting.

While weasels are regarded as "vermin" and enemies of chickens and young game birds, there is no doubt that as rat destroyers they have few superiors. When they can secure rats they will usually leave the chickens unmolested.

Among the active natural enemies of rats and mice around farm buildings, snakes occupy an important place, and this fact should be realized. Only one species of Canadian snake—the rattlesnake—is poisonous; our other native snakes are not only harmless but are useful as destroyers of rats, mice, and other pests, and they should therefore be protected.

In country districts, farmers should protect owls, the greatest of mice destroyers; and many of the hawks are valuable as destroyers of noxious rodents. The continued destruction of these natural enemies of rats, gophers and mice has been largely responsible for the increase in the numbers of the these food-destroying rodents, and it is important that the valuable services of these birds should be recognized.

Organized Destruction.—In England excellent results have been obtained by the co-operative eforts of farmers and others in the destruction of rats, and such organized destruction is essential if results of real value are to be obtained. The offer of prizes and bounties by local authorities has been found to stimulate effort. In many cities and towns the local authorities and organizations have promoted rat destruction, and it has been successfully stimulated by educational work.

We would urge the various organizations in cities and towns, and farmers' and women's institutes in rural districts to undertake educational work with a view to arousing public opinion as to the serious losses caused by these pests, and to promoting campaigns for their destruction.

Rats and mice are destroying millions of dollars' worth of food in Canada at the present time, when the conservation of food is a duty that devolves upon every one. The more food we permit the rats to destroy the less there is for us and our kinsfolk across the sea to eat. Never was the need of saving food supplies a greater necessity; never was the need of the most relentless campaign against these food destroyers. Eradicative measures should be prosecuted with the greatest vigor wherever these pests occur, whether on the farm or in the city.

THE FARM THE BEST TRAINING GROUND

(By J. S. Meagher)

A remarkable fact, and one that is not generally known, is that 75 per cent. of our public men were born on the farm. As a training ground for any profession or business the farm is the best starting point; in the first place the farm boy is removed from the oft times unhealthy atmosphere of the city, where bad companions often stamp into his character the germs of wickedness and thereby ruin perhaps a great career.

The city boy is usually supplied with so many diversions which, though harmless in themselves, are often the means of instilling a love for frivolity that detract seriously from the study of more useful occupations. On the farm, as nowhere else, is the rule instilled into the youngsters that punctuality is the essence of business, for on the farm if the hundred and one little things that go to make the sum total of the agriculturalists' calling are not done at the right time, then everything is in chaos; no, I have never yet met the farmer, either young or old, that was not right on time. Early rising is another asset that stands the farmer in good stead if he takes up another occupation. The farmer usually beats the sun by quite a bit.

Although it is very true that the muscle plays a big part in marring or making the farmer, it must be admitted that farmers as a class are a very commonsense lot. Trust them not to do anything rash or foolish, on the impulse of the moment; they will always take their time and study the pros and cons thoroughly before acting, once decided they'll carry their idea through to the end.

The farmer is described as an honest man, and that he really is. Untrammelled by the environment of city influences, he forms a code of morals that are simple and straightforward.

Men who are in authority now and were born and raised on a farm are, without exception, remarked for their clear and unbiased judgment in eve the most intricate public affairs.

Another great asset that stands the farmer in good stead if he leaves the farm is religion.

The man born on the land is nearly always a good Christian, thanks to the efforts of a good Christian mother. The farmer is not exposed to the temptations of every fancy religion or cult that so ften spring up in cities. Although it is true that the youngster on the farm has not the oportunity to attend high school or even night class, nevertlieless, the present system of rural schools is well orgonized to give the boys or girls a good foundation in the three R's; this in itself, coupled with deterimnation to succeed will get them anywhere, as witness the example of hundreds of our public men who started with the most elementary education but more than made up for this drawback by bringing into play the qualities they acquired on the farm. The outlook for the farmers is bright indeed. Already three great farmers' concerns have merged together forming the most powerful organifiation of its kind in the world today, and directed by some of the shrewdest men in the country, and all of them farmers, born and bred.

HORTICULTURE

OTTAWA FRUIT CONFERENCE AND N. S. FRUIT GROWERS

Port Williams, N. S.
The Editor, Maritime Farmer,
Sussex. N. B.

Dear Editor:—

As the Maritime Farmer is the official organ of the N. S. Fruit Growers Association I would like to make a report through your columns for the Nova Scotia delegates, of their work at the Fruit Conference held at Ottawa March 26th and 27th, and the resolutions passed at that meeting. There were in attendance only twenty official delegates from the whole Dominion. Four from B. C., six from Ontario, two from Quebec, one each from N. B. and P. E. Island, four from N. S., and at the special request of the Minister of Agriculture two were appointed to represent the buying interests of the Prairie Provinces. We had no knowledge of this Conference being called at the time of our annual meeting in January and our executive was asked to send representatives only two or three weeks before the date set for the Convention. Those appointed for Nova Scotia were, F. W. Bishop, Pres. of the United Fruit Companies; A. S. Banks, of the Cornwallis Fruit Company; and F. H. Johnson and Manning Ells, Pres. and Sect'y respectively of the Fruit Growers Association. Mr. A. E. MacMahon of the United Fruit Companies, was also present the first day of the Conference.

The Resolutions passed as given below pretty well explain themselves. The question of one uniform barrel for Canada has been a matter of debate and resolutions for at least twenty-five years, and it seemed as if we had come to a deadlock. A matter of compromise was never suggested before, but when the United States decided on a one sized apple barrel for their whole country, and some States especially either ruled our small barrel out altogether or allowed it to be sold under such restrictions as to very much discourage shipments, it looked as if we had everything to gain and nothing to lose in joining with Ontario in asking for a standard barrel for Canada in conformity with the one adopted for the United States.

If the recommendations of the Conference in regard to the barrel go throug, Nova Scotia apples will no longer be discriminated against in Liverpool and Glasgow on account of the size of the package as was the case in the past. If we have a large crop this fall we can use the new barrel to ship to the United States markets, and it may mean the difference between disaster to our fruit interests and a fair return.

Personally I believe the proposed amendments to the fruit marks Act will be the greatest step in advance for our fruit industry since the Act was pased some ten or twelve years ago.

The definition for the No. 2 has been brought up only to the standard as set for the past eight years by the most of the Fruit Companies, and all the most reputable packers in the Valley. It simply means that a No. 2 must be nearly as good as No. 1 in quality, but a grade lower in size. The Domestic Grade came to the front because it filled a place completely no other grade seemed quite fitted for. All the Conference did was to give it a name and take off the objectionable No. 3. So we will not have the confusion of quoting Co-operative No. 3, Extra No. 3, No. 3 Special, No. 3 Large and labelled No. 3 that all meant the same thing and yet did not mean anything that the buyer could be sure of. It will be noticed that the Domestic grade takes in No. 1 and 2 in size, leaving all below that size and exclusive of culles to be marketed under the grade of No. 3. As the definition of culls in the Act is now rather vague, the Department was asked to see that this was amended when the other changes were made. The majority of the delegates outside of those from the Maritime Provinces were opposed to having the No. 3 defined, wishing it to be simply marked and sold as ungraded or unclassified. We from Nova Scotia felt that we could speak with authority in the matter as we have sold No. 3's ungraded too long now for the good of the fruit growing industry After considerable discussion Ontario was willing to vote with us but B. C. contended that the Domestic Grade wass really a No. 3 and that this lower grade if defined at all should be marked No. 4. The Resolution as passed was finaly put through and on the second vote was unanimous.

The resolution on other packages, as plum and peach baskets and crates are not of much interest to our growers. The idea for one standard and uniform package for each class of fruit was adhered to right through the Convention.. The four-fifths strawberry box as used in N. S. was decided on as well as the two-fifth size and the full Imperial pint size that is used in B. C. Notice the pint in a square box, not flaring like the four-fifths.

The growers names and addresses will be required on all strawberry crates as well as on other open packages and Fruit Inspectors will be empewered to examine open packages at point of shipment and see that such are properly filled.

The following are the resolutions passed of particular interest to Maritime Province fruit growers, and the Fruit Commissioner expects that legislation in conformity with these recommendations will be placed on the statute books at the present session of Parliament.

Yours respectfully,
MANNING ELLS.

Resolutions passed at the Dominion Fruit Conference, Ottawa, March 26th and 27th, 1918.

1. That the United States standard apple barrel be adopted for Canada. Dimensions: 171/8" head diameter, 28½" stave, 26" distance between heads, 64" circumference at bulge, 7056" cubic inches content.

Further suggested that present manufactured stock may be used during the season 1918-19 but that after June 1st, 1918, all staves cut for apple barrels will be of the above dimensions.

2. That the American or Washington apple box, measuring 10½ x 11½ x 18 inches, inside measurement, be adopted as the standard for Canada and for exporting to such countries as have no legal requirements of their own; and that exporting to such countries as have legal requirements permission be given to export in the box required by the country to which they are being exported.

7. That three sizes of berry hallocks be made legal in Canada, namely, the standard four-fifths quart, the standard two-fifths quart and the Imperial pint measuring 4⅜" at top and bottom, and 1 2/8" deep.

15. That the following amendments be made to the Inspection and Sale Act, part IX.:

(a) Fancy frade eliminated.

(b) No. 2 to be defined "unless such fruit includes no culls, sound, of nearly medium size and some color for the variety and not less than 85 per cent. free from scab, wormholes, bruises and other defects and propelry packed"

(c' That a "Domestic Grade" be embodied in the Act and defined as follows: "unless such fruit includes no culls, sound and of not less than nearly medium size for the variety, 80 per cent. free from worm holes, but may be slightly affected with scab and other defects, and properly packed."

(d) That Grade No. 3 be defined to include no culls and be properly packed; and that the definition of the word "culls" be left in the hands of the Department of Agriculture.

16. That all packages of frpit offered for sale shall be well and properly filled at point of shipment and in cases

The Paint for the Barn

The barn is usually the most valuable building on the farm; it houses several thousand dollars' worth of stock, implements and foodstuffs. Don't leave so much valuable property unprotected. Safeguard it with

"HOMESTEAD LIQUID RED"

This is the best wearing and most economical paint for all farm buildings. One gallon covers 300 square feet, two coats, where the wood is in good condition. It's a wise investment to let this good paint protect all your farm buildings.

Paint the house with CANADA PAINT; decorate the walls with C.P. "SANITONE"; freshen up the furniture and floors with C.P. "SUN VARNISH STAINS". Ask the C.P. agent in town for further particulars.

Our book: "What, When and How to Paint" mailed free upon request.

DECORATIVE SERVICE FREE. Our suggestions and color schemes for finishing any part of the exterior or interior of your building would be helpful to you.

14. That no imature fruit shall be marketed except where the demand is legitimate and the package marked "immature" in plain letters; also that no fruit that is so materially diseased, wormy or otherwise depreciated as to be unfit for consumption shall be marketed; and that the Department be requested to draft legislation whereby the various points and facts embodied in these principles can be put into effect.

17. That the name and address of the packer be placed on all open packages.

18. That fruit packages repacked for sale shall be marked as such and bear the name and address of the repacker, and no change in grade marks sahll be made on such package without the authority of a Dominion Fruit Inspector.

19. That in cases where any standard fruit package is again used for any purpose, the original marking shall be obliterated.

THE FARMER AS A TRAINED SURGEON IN THE ORCHARD AMONG WOUNDED TREES

The "Missouri Botanical Garden Bulletin discusses tree surgery, with examples of the valuable results obtained from this work. It is remarked that there would be little need for this work if trees were properly planted, wellnourished and cared for. Injuries result from carelessness; nails are driven into the bark, trunks are girdled by wire, bark scraped by lawn mowers, and limbs broken, and tree repairs such conditions. While some "tree doctors" shroud the work in mystery, the operations are simple of tree structure, natuer of decay and principles of treatment are understood.

Materials Used

Proper treatment of wounds calls for prevention of entrance of insects and fungi, and facilitation of healing. Protective dressings must be applied to repel insects, either those that disinfect and preserve the wood, making it impervious to entrance of parasites. The first class incluedes creosote, carbolineum, corrosive sublimate, zinc chloride, copper sulphate, etc. Creosote and carbolineum are most generally used, but both are injurious to the cambium, and a coat of shelac should be applied before the disinfectant. The "fillers" include pure white lead and linseed oil paint, coal tar, slaters' cement liquid grafting wax and asphalt preparations. Paint and tar are most commonly employed, but are sometimes unsatisfactory when checking occurs after the wood drys out, leaving openings for parasites; this may be remedied by applying another coat after checking has taken place. Asphalt preparations are gradually superseding the others, being tough elastic and permanent. They are prepared commercially, or may be made by melting the asphalt, stirring in gasoline or linseed oil, and then adding fiber to give it body.

Surgeon's Treatment

Carpenters' gouges, 3-4-1 1-2 inch width, chisels, saws, pruning knives, and gasoline torch are included among necessary tools. First all rotten wood must be excavated, using gouge, chisel or gasoline torch. The mouth of the cavity must be wider in than out to retain the filling, the upper and lower end should be slanted downward to form water sheds, and the entire opening should have an oval form to facilitate healing. Then the cavity is braced by running 3-8-3-4 inch machine bolts from the side of the opening diagonally through the back of the tree. These are inserted every 12-18 inches, for the purpose of preventing the filling from cracking off from the sides, due to torisonal stresses upon the trunk. The hole for the bolt should be bored to be of the same diameter as the bolt, while a square opening should be made in the bark for the nut, deep enough to sink the bolt head under the bark so that it

WHEN HEIFERS FRESHEN THEY NEED GOOD CARE

Winter calving, as a rule, is attended with no more dangers than calving during the warmer seasons of the year, providing the cow is placed securely in a good box stall or warm barn with plenty of good straw bedding at the time. The main thing is to see that the barn is well enough enclosed that danger from cold draughts is eliminated. A barn can, and should be, well ventilated without making openings that will create cross currents of cold air. A dairy barn properly equipped will be provided with some good ventilating system that will furnish plenty of fresh air. It will be an added advantage if the box stall is so situated as to allow the sunlight to enter at some time during the day. It is not only more sanitary, but nothing looks more enticing than to see a healthy young calf basking comfortably in the warm, winter sunshine while curled up in the straw in the box stall. If the bedding is kept fresh and clean there will be very little danger of infection of the navel.

By reference to breeding dates it is possible to tell pretty accurately when the cow should be placed in the box stall. No chance should be taken in permitting the cow to run in the fields or pasture at this time. Too much is at stake. A valuable calf might easily be lost through chilling. A costly experience of my own along this line may better serve to illustrate as well as it may be a help to someone else. It was during the winter time and there was snow upon the ground. I was expecting a young heifer to drop her first calf. As was my usual custom, I placed her in the box stall in the barn, but did not keep as close watch over her as I should have done. Cows that have been fresh a number of times are usually very quiet and not so excitable at this time, but not so with the heifer in her first experience. In my absence, this heifer became very nervous and excited and broke out of the box stall and went outside the barn. She dropped a fine heifer calf in the snow. I soon discovered what had happned, but it was then too late. The calf was chilled through and was beyond saving. Under the circumstances I was thankful I didn't lose the heifer too. Now this was a costly experience for me and one that I have never permitted to happen again. The box stall was constructed from most too light a weight of lumber in the first place. Some planks or heavy boards should have been used in the construction and the walls built up reasonably high. It was a new and novel experience for the heifer and I should never have left the barn, but ought to have remained with her quieting her and rendering her assistance.

Practice has taught me that it is much better to handle the young heifers so that when calving time comes, my presence in the stall does not annoy them, but on the other hand tends to quiet their nerves. This, too, I have found a valuable practice in preparing the young heifer for milking. She can be made accustomed to the touch of the hand so that when milking begins there is nothing strange to her and the effect will asily be seen in her milk flow.

STERILITY OR BARRENNESS IN COWS

Manq inquiries come in regarding cows that are barren and do not come in heat. Next to tuberculosis and contagious abortion in cattle, sterility follows in the line of economic losses. As good cows are more valuable and feed higher, it behooves the breeder to keep none but cows that produce and reproduce. Often a favorite cow or a high producer or a pure-bred animal is kept in the herd, the owner expecting her to become settled sooner or later.

The causes of sterility are many—overfeeding show animals or cows fed for a high butter production. Remove the cause. That alone will often correct breeding faults.

Deformed genital organs, as faulty development or lack of development of the ovaries or Fallopian tubes, uterus or vagina. All these conditions are common, and as a rule cannot be corrected, so the best thing to do is to put the animal on the market, being sure that she is sent to slaughter and not to another breeder. Abnormal growths as tumors or cysts of the vagina, uterus or ovaries are not infrequent and produce sterility.

The Most Common Cause

Sterility resulting from contagious abortion is the most common cause, as abortion is common in a large per cent of the herds. Abortion produces sterility and shy breeders by causing a diseased condition of the ovaries and tubes. The germ that produces the disease is very common in the bull and is transmitted by contact. Cows that abort and retain the afterbirth are as a rule shy breeders.

The symptoms are a slight swelling, secretions collect and discharge, small nodules appear. A chronic form may last for months. Treatment for cows that have aborted consists of cleanliness and disinfection of the stables and local treatment of the cows and bull.

How to Treat the Trouble

The local treatment for the disease of abortion, consists of daily washing the external genitals with an antiseptic solution and irrigating the vagina with a mild non-irritating antiseptic solution. Never breed an animal until the discharge ceases. Always put an animal in quarantine after abortion or premature delivery. The discharges are very dangerous as the germs are carried on the feet from the rear of the cattle to the heads while feeding.

The discharges are dangerous to calves should they nurse from a soiled udder. Fatal scours and pneumonia are often caused from germs that are taken in from the udder. Milkers' hands should be washed and strong antiseptics should be used on the udders. The germ of contagious abortion has often been found in milk.

Cows that abort often retain the afterbirth and this causes inflammation, cysts, tumors, etc. An animal should not be allowed to retain the afterbirth longer than 24 hours. The parts CHAPT tion1a z w 1?Su jn should be removed by manipulation under the best and clearest conditions. After treatment use irrigations daily.

Relief for Many Cows

Abortion and sterility are now so common that veterinarians are working to stamp out the disease, also to correct abnormal condition in cows as far as possible. To do this cows are examined, the ovaries are manipulated and cysts and tumors are reduced and as high as 60 to 80% of shy breeders or sterile cows are made to breed.

When the afterbirth is retained it is a good plan to introduce ½ ounce iodoform in olive oil, using a large capsule or wrap it in oiled paper. This will dissolve and prevent decomposition and stops the infection.

The disease of abortion and the complications that follow are so common that if a breeder has a good clean herd he should be very careful not to bring infected animals to put with his herd. When abortion, the thing that produces most of the sterility, gets in a herd, a breeder should make up his mind that it is no easy task to clean up the herd. Good sanitary measures are of the most importance and treatment as outlined kept up. Some men use a vaccine to good advantage. Once the disease has run its course the cows are immune or a tolerance for the germ has been set up.—(C. M. Morgan, D. V. S.

SOME MISTAKES MADE IN FEEDING THE PREGNANT COWS

The real foundation of successfu feeding is surely in preparing th pregnant cow to withstand heavy mil production and at the same time nour ish and build up the frame and giv constitutional vigor to the young calf yet one need not go far in any com munity where dairy cattle are grow and fed, to find dairies where th pregnant cows are being fed upon th cheap feeds of the farm—mixed hay corn stover and straw—while the clov

The Best Advice Obtainable

Every farmer and dairyman knows that breeders or owners of record breaking cows don't experiment or take chances with their champions.

It is obvious then, that in regard to the care of cows, and the best method of milking, no better advice is obtainable than given by the owners of championship stock.

Mr. G. A. Brethen of Norwood, Ont., owner of many champions, Senator A. T. Fancher, owner of the world record holder, "Fancher Farm Maxie", and hundreds of the leading farmers throughout Canada advise—and by using, endorse

EMPIRE MILKING MACHINES

The experience of these owners of Empire Milking Machines proves that cows and heifers take readily to being milked by an Empire. The soft, gentle massaging of the vacuum cups sets up a pleasant sensation which soothes, causing the cows to give down willingly and contentedly.

If you have ten cows or more, an Empire can be installed economically, paying for itself in a short time by saving time and labor. With an Empire *one* man can do the work of *three* men milking by hand in the same time.

Empire Milking Machines do away with drudgery on the farm—they are always ready to work—and always work well, saving the cost of extra men, time and trouble.

The breeders of Champion Stock who use Empire Milking Machines have given us valuable information, which we have put into booklet form. It certainly worth a stamp, so drop us a line now while you have the inspiration.

er hay, ground oats and oil meal are kept for milk production. The very elements needed to stimulate heavy milk yields are absolutely necessary to create bone, tissue and blood for the new, fast-forming life.

The carbohydrates, which give heat and fat to the animal, are but little needed in the embryo or fetus. No motion, no heat, no energy is required; simply material to build and create, and this rapid development takes place during the last three months of the milking period, when if, at any time, the cow is dry.

The mistakes of feeding during pregnancy have come, no doubt, from a lack of knowledge of the effect of feeds. Nature makes an effort at this period to store up an adequate supply of nitrogenous lean meat, which, to the inexperienced eye, in an animal in very high flesh, presents the general appearance of fat. The very life of the cow depends upon her normal supply of blood, which must be supplied from these nitrogenous feeds. The blood must also contain a sufficient amount of minerals to supply the bony structure of the cow and her unborn calf. To a certain extent the pregnant cow has the power of converting the nitrogenous feeds into heat and energy, but she cannot under any circumstances convert the carbohydrates into tissue, blood and bone.

For a few weeks prior to calving, the cow should be fed laxative and cooling feeds that keep the bowels regular, rather than those of equal protein content, but possessing a stimulating and constipating tendency. Bran has laxative tendencies, is rich in minerals and also bulky. Ground oats are bulky, rich in minerals and seem to have a stimulating effect upon the organs of reproduction. Bran and ground oats can be fed to advantage in every combination of feeds for cows that are with calf. Oil meal fed in reasonable amounts in connection with bran and ground oats has a tendency to aid in the expulsion of the afterbirth. It is neither stimulating nor heating, is relished by all cattle and seems to possess tonic qualities that are particularly beneficial to general health. Such feeds as gluten meal, cottonseed meal and prepared dairy rations, while very desirable for producing milk, are dangerous feeds for pregnant cows and quite out of place in conditioning them for calving.

Especially during the period of preparation for freshening the cows should have good care, fresh air, sunshine and exercise. A cow kept confined in a narrow stall surrounded by foul air and dampness will bring a weak, poorly developed calf that will fall an easy victim to all ailments that make it so difficult to raise good strong calves. Even though such calves may live, they have been robbed of their rights of inheritance and never develop into as profitable animals as they would if they had been given proper embryonic care as well as food.

It is always preferable to plan the management of the herd so that the dry cows, or those heavy with calf, shall be turned out in the yards by themselves. Open cows and heifers that come in heat excite the cows heavy with calf and tend to injuries that cause abortions. The fact that so large a percentage of dairy cows are infected with contagious abortion germs renders the practice all the more dangerous because it may cause an outbreak which will sweep through the entire herd. The safe and sensible plan is to keep the cows that are heavy with calf away from the open cows and heifers, or at least to keep them so separated that there will be no danger of them becoming injured while running together in the yards and pastures.

If the cow is running in the pasture she secures fresh air, exercise and suitable feed and water, but not so with the cow that freshens in the barn during cold weather. She should have a dry, light and comfortable box stall, and it will be well if

SOWS AT FARROWING TIME

Farrowing time is the most critical season for the swine herd. At no other time will care and attention pay greater returns. The results of several months of labor and care may be lost by neglect at this period. Emphasis is justly placed on prolificacy of brood sows, but the number of pigs which they farrow is not the most important consideration. The number they raise determines whether the sow has been kept at a profit or loss. The sow which farrows five pigs and raises all of them is more profitable than the one which farrows fifteen and saves two or three. The disposition of the mother has much to do with the number of pigs she will raise. The way she is handled influences her disposition and, consequently, the results that may be expected.

Strict account should be kept of breeding dates and a week or so before a sow is due to farrow, she should be removed from the other sows to the quarters where she is to farrow. The feed just before farrowing should be the same kind that will be fed while the sow is suckling her pigs. This feed should contain plenty of protein and should also be laxative in nature. A ration of ground oats 50 per cent., good shorts 40 per cent., bran 10 per cent., should give good results. A few days before the sow farrows the amount of the ration should be reduced somewhat. If this is done, and a laxative feed is fed, the sow will come up to farrowing time without fever and will, for this reason, not be apt to injure the pigs by her own restlessness.

Keeping the Pigs Warm

The quarters should be warm enough that excessive bedding will not be required. If too much bedding is provided the pigs may become hidden in it and smothered or crushed. A bushel or more or chaff or cut straw will be sufficient. After the sow farrows it may be necessary to change the bedding, but the amount need not be increased. Dry bdding is more important than the amount of bedding. It should be changed often enough to maintain a dry bed.

Individual cots will be found valuable for keeping sows away from other hogs at farrowing time. Usually the less the sow is disturbed when she is farrowing the better. It is important that one be on hand, but unless she needs assistance, keep away from her. If the sow needs assistance, be as quiet in giving it as possible. The pigs should not become chilled before they have dried and suckled. If the weather is very cold, a lantern hung in the top of the cot will be of service. At such times, if the sow is gentle, it is well to place each pig, as soon as it is farrowed, in a barrel or box containing osme warm bricks covered with old sacks. The pigs may be left here until they are dry and lively cnough to be returned to the sow. If pigs do become chilled, there is no better way to revive them than to dip them in warm water.

The sow should not be fed much for twenty-four hours after farrowing. The pigs are not able to take much milk, and the milk flow should not be stimulated for the first few days. The sow will be more or less feverish and should have all the water she will drink, but will not need feed for a day or so. If the weather is cold, it is well to take the chill off the water before giving it to her. The first feed should be the same kind that she receivcd before she farrowed and should be fed in small amounts as a thin slop. The feed may be gradually increased as the pigs become able to take the milk until the sow receives all she will eat of a good, laxative, milk producing feed. Ordinarily about two weeks should be taken to get her on full feed. After the pigs are old enough to take all the milk the sow can produce, she should be fed liberally since there is no better way of feeding than through the mother.

EVERSION OF THE WOMB

This trouble is commonly termed casting the "Withers," and consists in the protrusion of the womb, or of the vagina, outwards between the lips of the vulva. It is met with more frequently in cows and ewes than in mares. The protrusion may be either partial or complete, and the condition is more serious when the womb is involved than if it is the vagina only. In cases of partial eversion of the womb, or of prolapse of the vagina, there is noticeable a rounded red mass protruding from the vulva. Where there is complete eversion of the womb the whole organ protrudes from the vulva, as an enormous mass hanging downwards. Complete eversion is always a serious condition and causes the animal to keep straining and to become greatly exhausted. Partial prolapse, accompanied by straining, is always liable to lead to complete eversion.

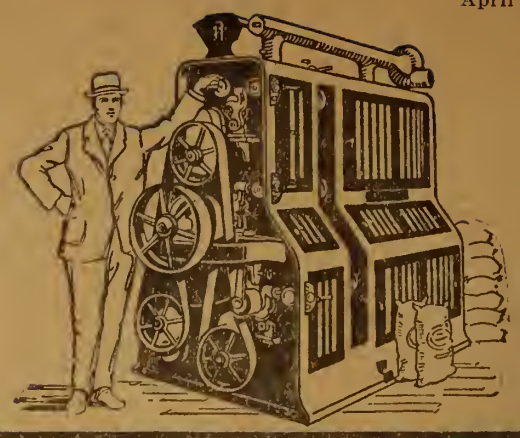
In cases of partial eversion of the womb, or of prolapse of the vagina, the protruding parts may be returned into place by pushing inwards with the hands. The parts may then be kept in place by means of a supporting rope truss affixed so as to compress the vulva.

In cases of complete eversion of the womb, the first step is to support the suspended mass by means of a clean sheet. It should then be washed off clean with a sponge and warm water. Any adhering dirt or shreds of the foetal membranes should be removed. The next step is to return the protruding mass into place. To do so, the animal should be kept standing, if possible, as it can be returned easier in that position. Several methods are recommended for returning the womb into place. In some cases it may be accomplished by means of the closed fist pushing in the centre of the mass until it is carried back inside the vulva and vagina, the other hand at the same time being used to assist in smoothing out and returning the surrounding parts. Another method is to take a long muslin bandage, five or six inches wide, and wind it around the protruding mass as tightly as possible. In applying the bandage begin at the lower end and gradually wind the bandage upwards, covering the entire mass up to the vulva. Having done so, the lower end is pushed forward within itself. As the womb is returning into place, the bandage gradually unwinds. The next consideration is to keep the womb in place, and this may be accomplished by several methods. The most simple and popular method is the application of a rope truss. Another method is to pack the womb and passage full of clean towels or cheese cloth coaked in a warm two per cent. solution of creolin. The packing material is then kept retained by applying a towel over the vulva outside and held in place by pieces of rope tied in front to the horns or around the neck. An additional precaution is to keep the animal in a stall which is raised much higher behind than in front.

SHEEP IMPROVE THE SOIL

The chancc of loss is small in the farm sheep business since comparatively little capital is invested in the flock even at the present high prices. It takes a rather wealthy man to now stock up in cattle but a man of limited capital can buy a few sheep and very soon have a large flock, returning most generous profits.

Sheep return two cash crops annually, wool from the breeding flock in the



Your Opportunity

A miller is wanted in your town to take care of the grain from the thousands of new acres now under wheat. More flour is needed.

Make this opportunity—your one big chance to establish a patriotic and profitable business in your town. The man who owns and operates a

Marvel Flour Mill

will reap the milling profits from increased wheat production in his vicinity.

The Marvel—the mill that makes that "nut flavored" flour—conforms to all Government regulations and gets the most out of the wheat. It is simply constructed, easily and cheaply operated and best serves the community's interests.

Establish a Marvel Mill in your town—stimulate local production,—stop waste, help eliminate long shipments, make good war or peace flour—and big profits.

If you have as little as $3000 to invest, you should get all the facts of this proposition at once.

THE ENTERPRISE FOUNDRY CO.
Sackville, N.B.

spring, and mutton from the lambs in the fall or winter. The advantage of cash coming in at different times throughout the year, rather than all at once, is appreciated by all farmers.

Sheep make more economical gains than any other type of livestock. They stand next to hogs in the amount of gains per given amount of feed consumed. Their advantage over hogs lies in their ability to consume roughage, hogs requiring a large amount of concentrates. They will not only eat anything that cattle will and make more pounds of gain on it but will also eat weeds and brush, on which a cow would starve. Due to their weed consuming ability, they will clean a pasture of weeds so that often it will support as many cattle as it formerly did besides feeding the sheep. They also keep the fence-rows clean and are excellent gleaners, picking up all waste grain and even eating much of the stubble after the grain has been harvested.

Another big reason why sheep should be kept on the farm is their ability to improve the soil. Not only is their manure of higher value than that of most animals, but due to their roving habits of grazing, it is thoroughly scattered. Because of their sharp hoofs, it is well tramped into the soil where it is soon available for plant growth. Due to the fact that they always search out one of the highest parts of the pasture to fold at night, they eave more manure there. This is an advantage as these places are usually less fertile, hence need the manure more than other portions.—A. L. Myrs, in the American Sheep Breeder.

SHEEPMEN, ARRANGE TO DIP YOUR SHEEP THIS YEAR

In the face of the high cost of feeds and the ever-increasing necessity of greater production, it becomes more imperative than ever before in the history of our sheep industry, that all handicaps such as the feeding of external parasites be eliminated as far as possible. It is hard to understand why dipping is neglected when one stops to think that it is next to impossible for sheep to make progress when covered with ticks and lice which annoy them continually. It is impossible to estimate the loss of feed and the depreciation in flesh when a flock is infested. One may be certain, however, that a great portion of the feed consumed by the sheep is taken up by these parasites.

A flock free from ticks and lice is the best insurance towards the better production of wool. The continual rubbing against fences, racks etc. causes a loss of wool and damaged fleeces which are docked in price. Dipping should be regularly practised at least once a year, and better twice a year. The sheep should be dipped in the spring as soon after shearing as weather permits; in the fall, before the arrival of cold weather. This will not only free old flocks from ticks and lice, but also tends to keep them free from any skin disease. Even though no disease or parasites be present, sheep should be dipped as a means of prevention and it stimulates the growth of the wool to some degree. Small flocks can be dipped in vats or other suitable utensils on the farm, but in the case of large flocks a regulation galvanized iron or cement tank will be found much more satisfactory.

The initial cost of a convenient dipping outfit would be the greatest drawback to the small owner who realizes the necessity of dipping at least once a year, but does not see his way clear to go to that expense, for a flock of from ten to twenty-fiv.

Community Dipping Outfit

By the small flock owners in a district combining and having a dipping tank jointly owned, it can either be placed at a convenient centre, and all flocks for a radius of from two to four miles being driven to the centre and dipped on a certain day or each sheepman using the tank in turn on his own place. By the latter method it costs more for dipping fluid, as the smaller the flock dipped the greater the waste, but in either case the cost of dipping is greatly reduced.

C. M. McRae.

Meeting Larger Markets

For years after the war, Europe will continue to require all the butter Canada can produce for export. With markets assured, farmers and dairymen demand a cream separator (1) that meets increasing demands without expense and delays of changing machines in order to get larger capacity; (2) that will get the greatest possible amount of first quality cream. A machine that meets both requirements is the

Renfrew

Interchangeable Capacity—When your herd increases you can enlarge the capacity of your Renfrew by simply changing the bowl and attachments. The Renfrew has but one size of frame and driving mechanism—suitable for the highest capacity. If you have a 350 pound capacity machine and later want to enlarge it to 450, 650, 800 or 1000 pound capacity, all you have to do is to order a bowl of the larger size with attachments—not the whole machine.

A large production of rich cream—Maximum production of firmer, sweeter butter-fat from the milk is accomplished by the Renfrew's exclusive curved wing centerpiece. *The Renfrew skims down to the last three ounces in every ton of milk skimmed.* If you have eight cows or more, this means a saving of butter-fat over the results from ordinary machines that will soon pay for the Renfrew.

The Renfrew's close skimming records are fully explained in our latest illustrated booklet, also results of tests by Government Dairy Schools.

Write for illustrated booklet to-day. It explains also the Renfrew's self-oiling system, its easy-to-run, easy-to-clean features, its low supply tank and high crank; its milk-tight and dust proof neck bearing and other important features.

Other Lines: Renfrew Kerosene Engine, Happy Farmer Tractors, Farmers' 2000 lb. Truck Scale.

NOTICE: The Renfrew Separator illustrated here was formerly sold under the name "Standard," which identified it as a high efficiency cream separator. The name "Renfrew" has been used on the same machine for several years for our United States and foreign trade and under that name has become as popular in those markets as under the name "Standard" in Canada. Now the name "Renfrew" has been adopted for Canada so as to link the name more closely with that of our company and so that we can sell the machine under a uniform name throughout the world.

THE HORSE

COST OF HORSE POWER ON THE FARM IN EASTERN CANADA

Horse power costs at least 50% less per hour than man power. For this reason more and heavier horses must be used to replace the shortage of man power. Nevertheless, many farmers in Eastern Canada have retained fewer horses than usual owing to high cost of feeds. This is false economy in any year, and especially under present conditions.

The actual cost of horse power is affected by the following factors,—

1. Weight, soundness and quality.
2. Distribution of labour over the year.
3. Condition and vitality.
4. Intelligent and careful handling.
5. Cost of feed.
6. Labour, interest on investment, etc.

The heavy horse of good quality gives the cheapest horse power on the land. The horse properly fed and fitted for work will give much cheaper power than the underfed animal or one soft muscled and lacking in energy.

Although every farmer should have all the horse power necessary, yet under existing conditions of feed and labour costs, horse labour should be so distributed and used to obtain maximum results at the lowest costs.

Every farmer should do a little careful figuring as to cost of horse power and consider well before allowing horses to run down in condition for want of feed and care, or to unnecessarily stand idle in stable or field.

A large amount of data on cost of keeping horses has been collected on the Experimental Farms and from other sources in Eastern Canada, and the following statement may be considered as fairly representative for Eastern Canada with such variations as are thereafter noted. This statement is for a horse weighing 1,600 pounds, working an average of 300 days per year. If the horse were idle during the winter months then the grain bill might be reduced 15% to 30%, at present a saving of $35 to $60. Feeds are charged at about present market prices, but may be figured by the farmer to suit the local cost prices.

Cost Maintaining 1,600 lb. Horse on Work for a Year.

1. Cost of Feed—	
Oats—6050 Lbs. @ 90c per bus.	$160.20
Bran—1300 Lbs. @ $35 per ton.	22.75
Hay—5840 Lbs. @ $12 per ton..	33.04
II. Labour including feeding, preparing feeds, cleaning harness, horse and stable..	28.00
III. Interest on value of horse —5% on $250.....	12.50
IV. Depreciation on value of horse per annum @ 5%...	12.50
V. Interest and insurance on building (costing $100 per horse) @ 5% per annum..	5.00
V. Interest on harness and other equipment @ 5%....	7.00
VI. Interest on harness and	
VII. Shoeing for average farm work	8.00
VIII. Veterinary, drugs, etc., etc. per horse.....	5.10
Total cost maintenance on regular work.....	$294.09

Whatever the reductions may be in cheap wintering of idle horses there is no doubt that it will actually cost $15 or more to maintain the horse during the six months starting May1, 1918.

Cost of Horse Power Per Hour

The actual number of hours per year worked by the average draught horse on the farm in Eastern Canada varies from 1.500 to 2.850, depending on local conditions and the proper distribution of horse labor. The feed costs varying in the same proportion from $155 per horse to $216 per horse at present prices would show an actual cost in feed alone of½ to 10 1-3 per hour of labor. The total maintenance cost in like proportion varying from $230 to $294 per horse would show an actual cost of 15 1-3c. to 10 1-3 per hour of labor. In other words, the greater the number of hours worked per horse the cheaper is the horse labor per hour in spite of the greater feed and labor bills.

Cheapening Horse Power on the Farm

Briefly the means of obtaining cheaper horse power on the farm are:

I. Heavier horses of better type and quality.

II. Feeding carefully in proportion to work performed.

III. Fitting for the extra heavy work of the year.

IV. Working the farm with good brood mares and raising both spring and fall foals.

If this latter plan is carefully followed the mare may easily produce annually in foals the equivalent of 50% or more of her feed cost and still perform 1500 hours or more of actual heavy labor, thus reducing by 15% to 40% the cost of per hour of labor. The type an dquality of the mare and, above all, the excellence of the stallion used ,would determine the success or failure in this regard.

AVOIDING SORE SHOULDERS

An improperly fitted or lumpy collar often causes a bruise, which later breaks into a running sore. There are too many mistaken notions about fitting collars. The commonest of these is that if a collar is buckled as cleosely as it will go at the top and room is left to pass a man's hand between the horse's neck and the collar at the bottom that the collar fits. Sometimes this happens to be alright, but in any case it is only part of what is necessary. Some horses shoulders are much flatter than others, some are more nearly bare of muscle, some are more tender. All these matters must be considered. A hard core or kernel is formed, which must be removed before this sore will heal. Often young or excitable horses will bruise themselves, even when supplied with well-fitting collars, by jerking, jumping or uneven pulling. Some horses seem prone to collar sores, and must be carefully watched to avoid this troublesome injury.

To prevent is more easy than to cure. Harden the neck and shoulders by bathing several times a week with salt water or vinegar in salt water. A little alum may be added. As a substitute for the old oakbark solution try tannic acid dissolved in glycerine. This toughens the skin by tanning it.

When a sore begins to appear, which is usually characterized by a slight swelling, very warm and painful, do not work the animal for a day or two if possible. If the horse cannot be spared make a snug-fitting felt pad, with the centre cut out, and place this over the injury.

Healing powders or ointments such as zinc oxide, boric acid, sulphur and lard, or carbolated vaseline may be used. If a watetry serum runs from the sore, equal parts of tannic acid and powdered alum will prove efficacious. Severe caustics, such as blue vitriol and the like should be avoided. They very often make the condition worse.

Horsemen Attention !

Dr. J. Woodbury's Horse Liniment and Dr. J. Woodbury's Condition Powders will save and preserve the life of your horses. Their use will cure and prevent the disease common to horses, such as Cough, Colds, Distemper, Spavins, Pinkeye, Splints, Curbs, Enlargements, Cracked Hoof, Kidney Trouble, Fevers, Cuts, Sores and will remove bunches of all kinds.

BEFORE USING

Why have a sick or lame horse, when you can get a reliable and warranted remedy? The leading horsement of the Dominion endorse Dr. J. Woodbury's Horse Liniment.

FOR SALE ALL DEALERS

PRICE 25 CENTS

Do you know that "Dr. J. Woodbury's Horse Liniment" is endorsed by all the leading horsemen of the Dominion. Save and preserve the life of your horses by its use. It will cure and prevent disease common among horses.

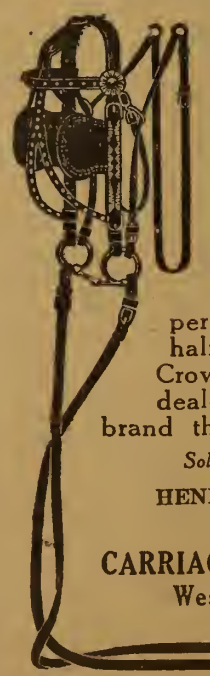
DEMAND
DR. J. WOODBURY'S
HORSE LINIMENT

AFTER USING

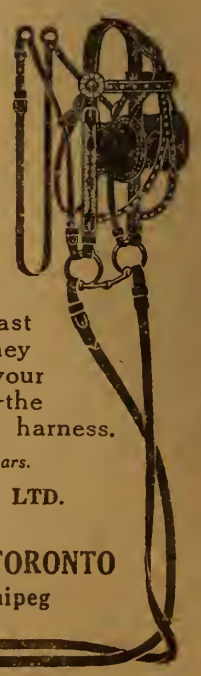
Use this preparation thoroughly for all and every disease of the horse for which it is recommended. Criticise it closely. Carefully watch, mark and notice, its effects, and, honestly judging it on its merits, you will be compelled to endorse it.

Heney Harness

CROWN BRAND



Examine a set of Heney Harness. Look at every detail, every inch of stitching, every inch of leather. Note the extreme precision and carefulness of detail with which every bit of workmanship is finished. Such an examination will be your own "eye-proof" of the superiority of the Heney Harness and will explain why experienced harness buyers for the last half century have preferred Heney Crown Brand Harness. Insist that your dealer show you the Heney Brand—the brand that guarantees a perfect set of harness.



Sold by dealers all over the Dominion for fifty years.

Price $1.50 per bottle. Sold by druggists, or sent by us express prepaid. Write for Booklet R.

The LAWRENCE-WILLIAMS COMPANY, Toronto, Can.

Only soothing medicines should be used.

If the shoulder becomes covered with sores it is because they are contagious, the germs being found in the pus. A good blood tonic is often needed and, in bad cases, the services of a competent veterinarian.

Till a man thoroughly realizes the importance of these two facts and fits his horses accordingly they will have galled shoulders. Some need the hames considerably lower than do others, because their shoulders may stand at different angles. Two horses in the same team, one with the shoulders having very little slant and the other with very slanting shoulders, are worked with the hames in the same positoni, the one whose shoulders do not come flatly against the draft will almost surely raise galle on its shoulders. If the draft is not in the right place the collar will either slip down so as to cut in at the top of the neck, or it will slip up. The result will be a sore neck and that is worse than sore shoulders. There is no more aggravatnig trouble to man and horse than a sore neck during a busy season.

In fitting the collar, the width of a horse's neck in proportion to the up and down length of collar is important. If the neck is thin at the top, as is the usual case with mares and geldings, the collar should be buckled tight at the top. If the neck is thick at the top, somewhat approaching the shape of a stallion's neck, a collar htat is the right length, when open at the top enough to allow for extra thickness will fit better than one long enoug to allow of buckling close at the top.

PROLONGING LIFE OF HARNESS

It is doubtful whether there is anything about the farm that depreciates in value so rapidly as does harness that is not properly looked after. In very few stables is there a room built where harness may be kept away from dirt and the stable dampness when not in use. The usual place for the harness is on pegs behind the horses, and from a point of convenience this is a good place for it; but when the harness is considered, stable conditions are found to shorten its period of usefulness. However, the stable will continue to be the home of most of the harness in the country, and an endeavor should be made to prolong its life if possible.

Harness is subject to all kinds of weather conditions and the leather soon becomes hard. Dirt lodges in the cracks. At least once and if possible twice during the year all harness shuold be taken apart and thoroughly washed and oiled. Not only will this treatment cause hte harness to last longer, but the appeaance will be greatly improved.

A warm day should be selected for this work, as it is impossible for leather to properly take the oil if the atmosphere is cold. Every part of the harness should be thoroughly scrubbed to remove the dirt. Luke-warm water-soap, a scrubbing brush and a strong arm to use it make up the necessary equipment for cleaning the harntss. Clean out the keepers and any dirt around the buckles. When the dirt is removed hang the parts in a warm place to dry. Harness oil or prepared paste should be applied to the leather. Neatsfoot oil is frequently used for oiling harness and is found to be very atissfactory if allowed to soak well into the leather. Lamp-black may be added to give the black appearance, but it is not essential. The mistake is frequently made of not rubbing the oil well in. Simply "daubing" it on is not enough. There are also several prepared pastes which prove satisfactory if properly used.

When cleaning and oiling the harness all parts should be examined and weak or worn parts repaired. A harness is no stronger than its weakest part, and a new strap, a few stitches or a new snap or buckle put on now before the season's busy work commences may save delay or passibly an accident later on.

THE ABUSE OF DIURETICS

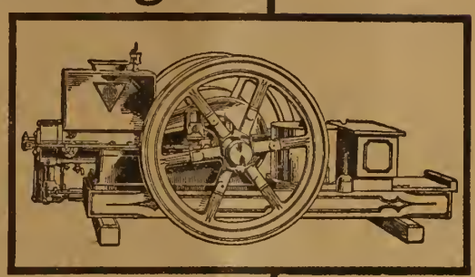
There still linger in some out of the way places old horsemen "who know all about a horse," and amongst other stable knowledge possess some wonderful recipes of extraordinary curative value. Recipes one might say in fact to cure anything in much the same way that some of the up-to-date quack medicines we see advertised, are guaranteed to cure nerves, debility, depression, kidney trouble, and all other ailments with which man is troubled. Many of these "old hands" used an—and some probably do still—make quite a nice little income by supplying grooms and stablemen with their nostrums; usually thep are applied to, to supply drugs to give a glossy coat, to expel worms, something to rub in to cure lameness, wind galls, etc.; and especially something "to clear the water," the kidneys and urine. These evils of animal medication have in the Old Country been specially legislated against, but breaches of the laws are difficult to prove.

Diuretics stimulate the kidneys to secrete more than the usual quantity of urine; some drugs are known to have this property, also some articles of food, such as snow-burnt hay, foxy oats, etc. The frequent use and overdosing of diuretics weaken the kidneys, set up chronic inflammation and suppression of urine, debilitate the horse, and lower his working condition.

Although many diuretics are known only two of the more commonly used will be alluded to here, saltpetre, or nitrate of potash, and powdered resin. The dose of the first should not exceed one ounce for the horse, and it is safer and more efficacious to give half this quanatity at intervals of twelve hours, preferably dissolved in the drinking water.

Alpha Gas Engine

So simple your boy can operate it—and always dependable



When you buy a gas engine you want one that your boy or your hired man can look after.

You want an engine that will always RUN when you want it to. That is the kind of an engine the ALPHA is.

There's nothing complicated about it—no fragile electric batteries, no attachments that puzzle you. Every part is sturdy—built of the best materials—and will stand up under hard work.

You simply oil the Alpha, turn on the fuel—either gasoline or kerosene—give the flywheel a turn, and your engine has started chugging away on an all-day run. You can go away and leave it—pumping water, running a feed-cutter or doing any of the many other things you want it to do. Any one of the thousands of Alpha owners in Canada will tell you that you cannot do better than to use this engine.

Write today for complete information as to how you can save time, labor and fuel with an Alpha Gas Engine.

Made in twelve sizes, 1½ to 28 H. P. Each size furnished in stationary, semi-portable or portable style, with hopper or tank-cooled cylinder.

Powdered resin acts as a diuretic; it is not lowering to the same extent as nitre, and is to be given mixed with a dampened feed; the dose is from two to three tablespoonfuls.

There are three cases where a diuretic may be advisable and given with good results. The ox may be kept tied up and without exercise for long periods at a time, and the legs will remain fine. Not so with the horse; he is liable to get swollen legs; some show such a tendency even after one day's rest. The usual treatment is a dose of nitre, which doubtless fines the legs for a time, but the symptom has been treated, not the cause, and the horse is rendered more liable to a repetition. In the majority of cases a tonic, not a lowering treatment, is necessary—massage, warm supporting bandages, and an iron tonic, with small doses of blauber salts, two to four ounces, in water or food, would be curative.

In the case of horses subject to lymphangitis "Monday morning disease," diuretics are often given to reduce and prevent the swelling; but their efficacy is a matter of doubt. Two or three ounces of glauber salts in a warm, sloppy bran mash on Saturday night, and a similar dose on Sunday night, would give far better results, but with this proviso, the horse is never to be kept in the stables tewenty-four hours without exercise.

It is, however, in the character and appearance of the urine that the man in charge bases his opinion that "the kidneys are affected," and that his business is to give large and frequent doses of nitre to rectify matters. As a matter of fact, kidney disease is rare in the horse, and what he considers wrong in want of transparency, uqantity, color, onsistency, may be quite normal.

The urine of a healthy horse is usually turbid, and the quantity varies with the diet, work and seasons, the color varies from clear yellow to yellowish red, especially if red carrots are being fed; if fed on green food, These changes are quite compatible with health, and no drugging is required to rectify them, or bring the urine to a fancied standard, so frequently done at the expense of the horse's health.

It is no exaggeration to say in conclusion that many cases of obscure illnesses are astually brought about by the pernicious habit of administering diuretics as a regular part of the self-imposed duties of some horse attendants.—B. C. TILLETT.

The Recognized Specific of Diseases of the Horse

A sovereign remedy in powder form which cures, Coughs, Heaves, Colic, etc. It strengthens the work horse as well as the race horse, and enables them to do more and better work. It has been successfully prescribed by many veterinarians notably by Dr. J. D. Duchene, in many critical cases, where results have proved remarkable.

A 50c box will be sufficient for six days' treatment.

POULTRY.

INCUBATION

The keynote to successful winter egg production is "Early hatching." It matters not whether the natural or the artificial method of incubation be used, the chicks must be hatched early, if the best results are to be obtained. If it is impossible to secure enough broody hens early in the season to hatch the number of chicks required, purchase an incubator.

In buying a machine, it should be borne in mind that at the most only three hatches can be taken off in the proper hatching period. The incubator, therefore, should be of sufficient capacity to produce at each hatch, at least one-third the number of chicks required.

There are a lot of good incubators on the market. Do not be deluded into buying a machine just because it is low in price. The low-priced incubator is very often the most expensive in the end.

The incubator should be placed in a room that is fairly even in temperature, has a good, solid floor, and that can be well ventilated without draughts.

In running any incubator, the manufacturer's general directions should be carefully followed as he is the one that should know best what his machine requires.

At the same time, a little variation in the handling will often greatly improve results. Climatic conditions sometimes alter requirements. A machine that does not require added moisture in one locality may in another. A relative humidity of between 50 and 60 inside the egg chamber gives the most satisfactory results; if a machine is not giving these conditions, moisture should be added. This may best be done by placing a tray of wet sand either under the egg tray or above it, depending on how the machine is heated.

In starting the machine, run it for several days until it is perfectly regulated before putting in the eggs. The two kinds of thermometer most commonly used are the standing, which should register about 102, and the hanging, which is usually hung and should register 103. If the hatches are slow in coming off, raise the temperature in succeeding hatches and vice versa.

From the second day until the eggs begin to pip, they should be turned twice a day. They should also be cooled, the length of time for cooling depending on climatic conditions and the temperature at which the machine is being run.

It is advisable to test the eggs twice during the hatch—once about the seventh day when the infertile eggs and "blood rings" should be removed and again about the fourteenth when all dead germs should be taken out. A little practice will soon teach just what it is safe to take out and what to leave in.

As soon as the eggs begin to pip, which will usually be about the eighteenth day, close up the machine and leave it until the hatch is over. When the temperature rises a degree or two, don't get excited, as the rise is to be xpected at this time, and is a good sign. It is due to the heat generated by the chicks struggling to free themselves from the shells. Wait until the hatching is over and the chicks have become thoroughly dried before opening the machine.

POULTRY THAT PAY AND MONGRELS THAT ARE KEPT AT A LOSS

Pure-bred poultry has many advantages over mongrels, and amateur poultrymen who fail to see them are doomed to limited returns and in some cases total failure. Pure-bred is a term applied to fowls that have a long line of ancestors that have been bred pure and without the intermission of alien blood. There is more dependence to be put in the breeding of pure-bred fowls than in that of mongrels.

Pure-bred matings will produce offspring that resemble the parent stock in many ways including size, shape, plumage, egg production, quality of meat, and the power of reproducing pure specimens. Pure-bred poultry of the egg breeds will lay a greater number of eggs than will those of mongrel type. This is because every bit of surplus food that they receive goes to the production of eggs and not to growth of flesh. Pure-bred poultry will produce higher quality meat than mongrels will. The meat breeds have been so bred that all surplus food above what is needed for the upkeep of the body, will go to the production of high class meat. Most mongrel flocks embody a high percentage of Meditteranean blood. The Mediterraneans have a scant supply of meat, many fibrous bands, and very little fatty tissue. The Ylymouth Rocks and Wyandottes considered to be the best type of meat producers have less fibre, more fat and an abundance of flesh growth.

Pure-breds produce a more uniform egg. Each separate breed produces an egg of a certain size and color, and when cross-bred some of the eggs will be large, some small, some brown and some white Some markets demand eggs of a certain color; others will pay a premium on eggs of uniform size and color.

Pure-breds are in demand, and the person who takes up mongrels will never get above market price for stock and eggs. The price paid for pure-bred stock is always higher than for mongrels, and even a commercial plant can find ready sale for surplus stock as breeding birds.

The standards by which pure-bred birds are bred and judged are so arranged that production of high-class eggs and meat goes along with beauty. Thus a flock of pure-bred poultry whether few or many makes a better and more pleasing impression on a prospective customer than does a mixed flock. The uniform flock shows that systematic and intelligent breeding is being practiced. Although looks may not have a strictly commercial value it does establish a name and reputation for the flock or strain which will consequently bring more orders for stock and eggs.

There is more efficiency in feeding pure-bred birds. A poultryman usually selects a type suited to his business whether it be the production of meat or eggs. There is no efficiency shown in the feeding of mongrels of the Asiatic type for eggs. Neither is there any shown in the feeding of mongrels of the Mediterranean type for meat. As efficiency is a present-day slogan this argumnt should have especial weight.

The first cost of pure-brd birds will seem prohibitive to some, and of course the cost of some high-class pure-bred birds is prohibitive to the amateur. This is probably a good thing as the amateur is not fitted nor capable to get the best results and returns from them. The thing the amateur should do is to get a few of the best birds that his pocket book will stand, of the breed that best suits his fancy and purpose. He can cull out the poor specimens each year, and by this system known as "grading up," he can soon have a uniform flock, producing a uniform egg, and in every way a pure-bred flock.

L. L.

HANDLING AND SHIPPING THE DRESSED POULTRY

The specialists recommend the particular observance of the following methods of handling dressed poultry, which are essential to a perfect product at any time and are of vital importance whenever weather conditions are unfavorable:

Keep the shipping crates for your market stock clean, well aired, and free from vermin, and see that the chickens have plenty of fresh water and plenty to eat.

Don't kill a chicken when the crop is full of feed. Give the chicken only water for twenty-four hours before it is killed. Food in the crop or in the intestines of a dressed chicken causes loss of flavor and hastens decay, which more than of-sets any gain from extra weight.

Good bleeding is absolutely essential to a good appearance on the market and retards decay. Circular 61. United States Department of Agriculture, explains the best methods of bleeding and loosening the feather muscles for dry picking.

Hang the chicken by both feet while picking. Hanging by one leg spoils the shape of the bird. Picking on the lap gets the skin dirty and hastens decay.

Dry pick if possible. Scalding is particularly undesirable because it hastens decay.

Chill every dressed bird until the body temperature is below thirty-five degrees Fahrenheit. Never pack or ship an imperfectly chilled bird. More decay is due to imperfect chilling than to any other single factor in dressing. Dry chill, if possible. Chickens cooled in water lose flavor, decay sooner, will not cold store as satisfactorily as dry chilled, and are in every way more undesirable on the market. Refrigerator cars will carry well chilled goods in good condition, but they cannot chill warm goods to a sufficiently low temperature.

Pack in boxes or small kegs whenever possible. A large barrel makes an undesirable package, because where poultry is packed in large masses the weight of the upper layers crushes the birds at the bottom.

Line all packages with parchment paper and cover the top of the poultry before the lid is put on.

Wrap every head in suitable paper so that blood from one bird will not mar the appearance of another.

Use only good refrigerator cars and see that they are in good order. Ice

A Matter of Life and Death

There is no more vital question before the poultry raiser right now than that of saving Baby Chicks. The most important factor is proper feeding. Wrong methods of feeding mean, literally, life or death to the chicks.

Pratts BABY CHICK FOOD

brings the chicks safely through the critical first three weeks. Prevents the usual heavy mortality in young chicks. Insures rapid growth, sturdy constitutions and freedom from intestinal trouble, leg weakness and other diseases common to the newly hatched. Start right with "Pratts." Feed it exclusively for the first three weeks. About one cent per chick is all it costs for the entire period.

Money Back if not Satisfied

and salt the car twenty-four hours before loading. The car, at the end of twenty-four hours, should show a temperature below forty degrees Fahrenheit at a point fou rfeet above the floor and between the doors.

Never handle chickens roughly either before or after killing. Rough handling causes bruises, broken bones, scarred skins, and soft places in the flesh. Undue haste on the part of the killers and pickers results in lowered quality and poor appearance of the product.

Piece work, which leads to quantity rather than quality, makes for lower prices on the market. Those who pay by the piece should remember that they sell by the quality of the piece.

These directions will apply with equal force to turkeys intended for the later holiday market.

GIVE YOUR HENS A FAIR CHANCE IN GOOD BUILDINGS

Many farmers still hold to the old-time idea that a poultry house that is intended to house a flock of winter layers, should be tightly closed on all sides—that every crack, crevice or opening should be tightly boarded up.

Contrary to the general opinion, a house that is closed is colder than one that is more open. By far the greater part of the moisture in the hen's body is expelled through breathing, and the air in the house that is closed soon becomes charged with moisture. This damp air makes the house cold, and frost gathers on the ceiling and walls.

The air of a closed poultry house not only becomes moist, but is becomes very impure. Pure air is essential to keeping up the bodily heat of hens, and when the air is impure the resisting force of the hen is greatly reduced and the cold cuts to the bone. Besides being colder, a house full of damp, impure air makes favorable conditions for the development and multiplication of the germs that cause colds, roup and other diseases of the respiratory passages.

Poultry investigators have determined that the air in a poultry house should change completely every twenty minutes. The only way to provide sufficient ventilation to accomplish this is to leave part of the south side of the house open. A safe rule to follow is to have as much open space as there are windows in the south side. Curtains should be provided to cover the openings during snowy or rainy weather, and on severe nights. These curtains will not greatly interfert with the ventilation of the house, since the air can readily sift through the cloth. During ordinary winter weather, however, there is no necessity for having the curtains down.

Some writers recommend the use of roosting closets during the cold months. These roosting closets are box-like structures built against the rear wall of the house. A curtain is provided to stretch across the front of the closet. I had my houses fitted up with these closets and used them one season. During the winter the closets were used I had more cases of roup and colds than I ever had before, or have had since. A roosting closet may be warm, but hens compelled to spend their nights in a small inclosure and breathe the foul air that arises from the droppings may be expected to contract any disease.

The poultry house should be absolutely tight on the north, west and east sides, so as to prevent drafts. If the house is a long one a tight board partition should be placed every 20 or 25 feet to prevent air currents from forming. A drafty poultry house is a death trap. T. Z. R.

TO TRUSS A FOWL

After stuffing the fowl, sew the skin of the neck over the back. Then run a long skewer through the pinion and then through the body and out through the other pinion, pressing them close to the body. Also press a skewer through the thigh and body and out through the other thigh. Pass a string over the projecting ends of the skewers and tie it firmly at the back, to keep the bird firmly trussed. The legs can be crossed over the tail and firmly tied. The wings and thighs can be tied in place by winding a string around the body, if you have no skewers; cut the string off carefully when done, so as not to tear the flesh.

HATCHING CHICKS BY OLD HEN METHOD

Boxes eighteen inches square and eight inches high made good nesting boxes. The nests should be built carefully, preferably with earth in the bottom. the corners being well filled, covered with soft straw or leaves. If the nests are too deep the eggs may pile up and break; if they are too shallow the eggs may roll out. The nests should be placed in a secluded place and the hens should be set after dark. If the hen sits well upon nest eggs for a day or two then she should be given the regular eggs. Set a number of hens at the same time if possible, but where several are sitting in the same room it is well to have the nests covered so that each hen will be confined to her own nest.

The hens should be dusted thoroughly at the time of setting and again just before the chicks hatch; take each hen by the feet, holding the head downwards, and sprinkle lice powder into the feathers and then rub it all around the joints.

Feed the hens on a variety of hard grains and keep clean water before them always.

Be very sure to hatch your chicks as early as possible because late hatched chicks rarely lay well in winter.

Cream Saving Machines

IF YOU are still setting your milk and skimming by hand, you are losing anywhere from one-fourth to one-third of your cream. If you are using a separator, and it is not one of the best, you are still losing an amount of cream that would surprise you if you knew it. Every farm loss or leak that can be stopped this year should be stopped. Buy a **Primrose** cream separator and stop the cream loss.

Don't imagine that cream left in the skim milk will fatten pigs and calves faster. It has been proved scores of times that stock thrives as fast on warm separator skim milk, when a little meal or flax replaces the fat. Cream in the skim milk is dead-loss cream.

Primrose separators get that cream. We can prove to you that they get it all, except about one drop in each gallon.

Besides that, they are well-known as simple, easy-running, easily-cleaned machines that last and do the same good work year after year. Buy a **Primrose**—it will pay back its cost in cream you may now be losing. See the local dealers who handle these separators, or, write the nearest branch house for catalogues.

PEERLESS PERFECTION

A RUNAWAY HORSE

can't break a Peerless Fence. No fiery bull can make a dent in it, hogs can't push through the spaces.

It holds them all **securely.** Ask your nearest dealer to show you the Peerless farm fencing. See the heavy, crimped horizontal wires that allow for all expansion or contraction in extremes of temperature. See the famous Peerless lock that holds the intersections in a firm, non-slippable grip. See the Peerless farm gates. Your dealer guarantees the Peerless to give satisfaction and we stand back of him unconditionally.

Letters Like These from Halifax to Vancouver

The Banwell-Hoxie Wire Fence Co., Ltd.
Hamilton, Ontario

Dear Sirs: I am writing a testimonial as to the strength of your PEERLESS Junior Chicken Fencing. Mine is four feet high. It turned two horses, each weighing 1400 pounds. They ran full tilt into the fencing about 2 rods from each other at the same time. The resnlt was that they turned a summersault over the fence, alighting on their heads and necks, scratching them up some, but the fence remained intact. Yours truly,

JOE BOOTHROYD.
Surrey Centre, B. C.

The Banwell-Hoxie Wire Fence Co., Ltd.
Hamilton, Ontario

Gentlemen: I have handled your fence for four years and find it a good, strong and durable fence, and find that the galvanizing is first-class. In referring to this I have a fence that I put on four years ago across a gulley and the water is as high as the second wire and it is not rusted nor broken yet. I have a team of heavy horses that ran into the fence last summer and did not break or damage it in the least, and I am glad to say that in the four years I have handled your wire I have had no complaints about it.

Yours truly,
Bowesville, Ont. DAVID CUMMINGS.

The Fence That Saves Expense

It never needs repairs. It is the cheapest fence to erect, because, owing to its exceptionally heavy top and bottom wires, but half the usual amount of lumber and posts are required.

SEND FOR LITERATURE and address of nearest agent. We also make a complete line of poultry and ornamental fencing. Agents nearly everywhere. Agents wanted in unassigned territory.

THE BANWELL-HOXIE WIRE FENCE COMPANY, Ltd.
Winnipeg, Man. Hamilton, Ont.

PEERLESS THE ALL ROUND FENCE

Vast Issues Depend
Upon the Welfare of Our Boys

TRY to picture yourself in the muddy cold trenches after exciting days and long nights of mortal danger and intense nervous strain. Rushing "whiz-bangs" and screaming "coal boxes" are no respecters of persons. You are hit! But despite shock and pain you still can face the long weary trudge back to dressing station. Weary, overwrought and depressed you are prey to wild imaginings of that other coming ordeal with the surgeon. There are other "walking wounded," too! You must wait, wait, wait. And then—

Up comes a cheery Y.M.C.A. man, the ever present big brother to the soldier, with words of manly encouragement. Close beside the dressing station the good, generous folks at home have enabled him to set up a canteen. He hands you biscuits, and chocolate or coffee.

"In thousands of cases," writes an officer, "it was that first hot cup of coffee that dragged the man back to life and sanity!"

The tremendous helpfulness of the Y.M.C.A. as an aid to the "morale," or fighting spirit, of the soldiers is everywhere praised. No wonder the Germans make every effort to smash the Y.M.C.A. huts out of existence.

Cheer Up, and Thank God for the Y.M.C.A.!

Y.M.C.A.

Red Triangle Fund

$2,250,000, May 7, 8, 9

Canada Wide Appeal

The Y.M.C.A. is **everywhere.** You first met the helpful manly Y.M.C.A. worker in camp, then on train and boat, at camp in England and in France, close to the firing line. Often he risks his life to reach you in the trenches. He has won the warmest praise from military authorities, statesmen—the King!

Have you a precious boy at the front? You cannot be "over there" to guide him away from fierce temptations of camp and city. You cannot comfort him in his supreme hour of trial. Your parcels to him are necessarily few. But the Y.M.C.A., thank God, is "over there," going where you cannot go—doing the very things you long to do— doing it **for you and for him.**

Will you help? This vast organization of helpfulness needs at least $2,250,000 from Canada for 1918. For your boy's sake be GENEROUS! !

Brief Survey of Y.M.C.A. Service to Soldiers

Branches in 20 Forestry Camps established last year.

Y.M.C.A. nightly under fire in many places.

300,000 letters a day written in Y.M.C.A. buildings.

Troops furnished with athletic equipment (helps morale of troops).

Entertainments, Bible classes, sing-songs, good night services and personal interviews conducted by Y.M.C.A. workers.

Y.M.C.A. Red Triangle Clubs in Toronto, St. John, Montreal and other cities for returned soldiers and enlisted men.

Y.M.C.A. service extends from Vancouver to the firing line and then back to patients in hospitals until men are discharged.

Y.M.C.A. Secretaries accompany troop trains.

Between 400 and 500 millions of letters and cards written and posted in Y.M.C.A. tents, huts and dugouts since war began.

Splendid service to boys in Canadian Camp hospitals. Regular sing-songs and inspirational addresses with distributions of magazines, fruit, chocolates, gum, books and smokes.

National Council, Young Men's Christian Association

Campaign Directors for Maritime Provinces

New Brunswick: Eber H. Turnbull, 64 Prince William St., St. John, N.B. Nova Scotia: D. G. Cock, Chronicle Bldg., Halifax, N.S.
P. E. Island: Lieut. Ulric Dawson, Headquarters Y.M.C A., Charlottetown.

They are Fighting-Dying-for YOU!
What are You Doing for THEM?

IF only you could be in France, close to your boy, think of the comforts you could send him into the lines, how you could hearten him for the supreme ordeal of battle, shield him by your advice, from temptation, comfort him in pain, help him turn his eyes, not always downward into the chaos of war, but upward to the Right we fight for, and to the higher things he learned on your knee

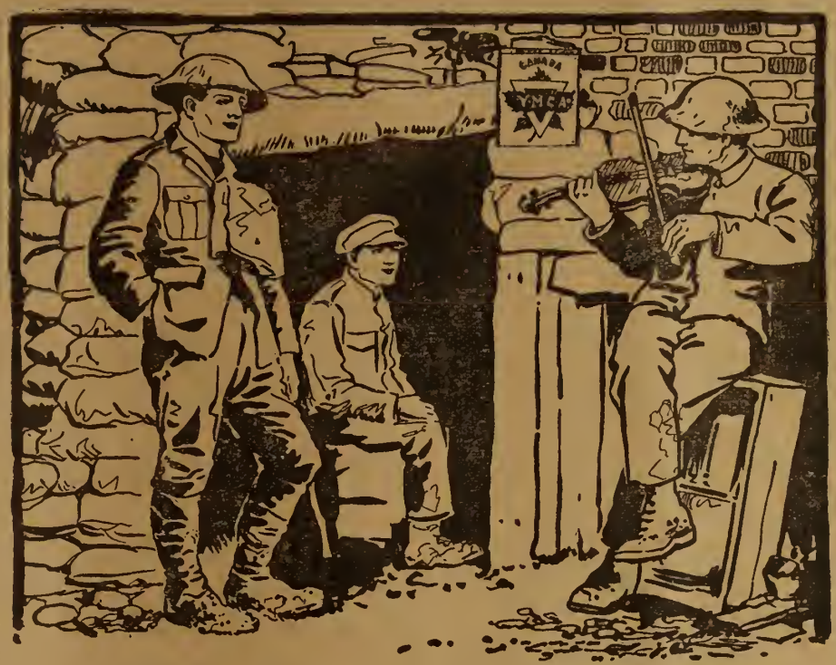
But no—thousands of miles separate you! Not for you are his furloughs, no visits to camps for you, no privilege of visiting your boy in hospital, if need be. Few and far between are the comforts you can send across the wide seas!

Would that you had a friend over there to perform these offices for you! Thank God, **you have that friend.** The Y.M.C.A. is ever at your boy's side, from the day he enlists to the day he doffs his uniform—in camps, trains, boats, in the streets of the big city, in hospital, behind the firing lines—and often right into the trenches—everywhere.

"Right on the heels of the dashing Canadian soldiers at Vimy Ridge the Y.M.C.A. men were serving out biscuits and chocolate to the tired men," said the dispatches. The General was enthusiastic and recommended one of the Y.M.C.A. men for the Military Cross!

Said Lord Northcliffe, "I do not think the War could be fought without the Y.M.C.A.!" A general declared, "The benefit to the troops is beyond all calculation." In the words of Ralph Connor, "The Y.M.C.A. is nearer to the boys than anything else."

Think of the tremendous cost of building and maintaining hundreds of huts with all the thousand and one comforts that must be provided. What will you give to show that you care for your boy's welfare? At least $2,250,000 is needed for 1918. For the sake of your precious boys, be Generous!



War-Work Summary

There are—
89 branches of Canadian Y.M.C.A. in France.
74 branches in England.

Y.M.C.A.

Red Triangle Fund

$2,250,000, May 7, 8, 9

Canada Wide Appeal

Dozens of Y.M.C.A. dug-outs in forward trenches under fire.

$100,000 needed for athletic equipment (helps morale of soldiers).

Y.M.C.A. saved hundreds of lives at Vimy Ridge by caring for walking wounded.

Over 100 pianos in England and France, also 300 gramophones and 27 moving picture machines.

More than 60,000 cups of hot tea and coffee distributed daily in France—free. Estimated cost for 8 months, $48,000.

150,000 magazines distributed free every month. (Estimated cost $15,000).

$125,000 used in 1917 to build huts in France.

Thousands of soldiers decide for the better life.

Y.M.C.A. sells many needful things to soldiers for their convenience.

Profits, if any, all spent for benefit of soldiers.

Service to boys in Camp hospitals.

Red Triangle Clubs for soldiers in Toronto, St. John, Montreal and other places. Centres in Paris and London for men on leave.

Out of Red Triangle Fund, $75,000 is to be contributed to the war work of the Y.W.C.A.

Cost of administration of Y.M.C.A. war work is less than 1%.

FOR HOME AND COUNTRY

This Department will be utilized to the best interests of the homes in the Maritime Provinces. Subjects relating to household science and all that stands for better homes and communities will be published on this page. The editors, Misses Saunders and Winter, of Fredericton, N. B., solicite your assistance in making this page a success and will be glad to publish tested recipes, household discoveries and other articles useful to the homemaker and women's organizations.

BILLY'S ORGY

By Grace S Richmond

"Julius," said Mrs. Jack, from the library doorway.

"M-m?" replied Julius abstractedly, without looking up from the letter he was writing. Spoiled drafts of it lay all about him, and his face was flushed.

"Jack and I are going to run into town for the evening. Cook is in the kitchen. I've sent Mary out on an errand, but she will be back in a few minutes. Billy's asleep in the nursery—he won't waken. But if you should want to go out just make sure that Mary and cook are both in—will you? I don't like to have Billy alone in the house with only one of the girls."

"M-hm," assented Julius, still without looking up. His sister crossed the room, laid one gloved hand upon the top of his head, placed the other under his chin, and gently forced him to give her his attention.

"Do you hear what I say?" she urged.

"Yup. I'm not to go out till I know cooky and nursy and cooky's policeman and nursy's postman are in. Shall I have them sit in a circle just outside the nursery door?"

"We shall be back on the ten-forty-five," promised Mrs. Jack, hurrying to the door in response to an urgent appeal from the vestibule. A tremendous gust of wind swirled in as the door closed, rushed through the hall and sucked the various drafts of Julius' letter from the desk. He got up impatiently. At the same instant Mrs. Jack ran back into the house.

"It's storming frightfully," she called, as she dragged some sort of extra wrap from the hall closet and hurried back to the door. "We shouldn't go if it weren't that the Wetherby's always are so——"

Another slam of the door, a fresh whirlwind around the library desk, and Julius tore his latest effort into bits and threw it after the loose sheets which had danced into the corner. He strolled to the window, pulled aside the heavy curtains, and stood gazing out.

"Gee—it is something of a night," he commented. "Wonder Bud got up her courage to go into town in such a storm. Guess I don't care much about sallying forth to call on the Meredith girls, after all. Wondon if there's anything new to read here!

He turned about, looked discontentedly over the shelves, opened two or three books and a number of magazines, dumped them one by one in a rejected pile on the desk, and idled over to the window again.

Two dark forms plunging through the snow waved arms of greeting at him, and he hurried to the front door.

"Well—you fellows must be sick for an airing," he cried, as he admitted an avalanche of snow and a cutting blast of wind at the same time with his chums.

"Get into your togs and come along," commanded the guests, shaking and stamping in the hall, and going over to the fireplace to pull off gloves and warm frozen fingrs.

"Oh, say—not in this blizzard."

"Blizzard nothing. It's a nice night—some of it. What's the good of the holiday vacation if you sit by the fire all through? And the Meredith girls wouldn't take us without you."

"Come off. You haven't been there yet."

"That's right," insisted Tom Ward. "Sally said, 'Go and get Julius Broughton, or you can't stay.' So there we are. Come—hurry up."

"You'll have to wait till I set the bread," said Julius, mounting the stairs without haste.

The two by the fire shouted. Julius lookd grave.

"—and give the baby his cough medicine," he continued. "I'm in charge. I'll have to wind the clock and fill the furnace, an see that all the windows are fast, and put on the night-light in the bath-room—"

"Oh, hurry up!"

"—and see what the temperature is in the nursery—and set the thermostat, and——"

His voice trailed off in the distance, still enumerating particulars. A door slammed somewhere—then another. Presently he called over the baluster:

"You fellows wearing white waistcoats?"

"Yes—HURRY UP!"

Julius dressed with greater speed than his manner with his friends would have predicted. He reappeared prsently, looking extremely elegant.

"Got the bread set?" jeered his guests.

"Er—no. I'll have to speak to cook about that." He disappeared into the dining orom and was heard making a progress through various unknown regions, calling people ho seemed to return no reply. In the course of time he arrived in the hall again.

"If we'd known you were a family man——"

"I am," said Julius solemnly. "I can't find cook nor Mary. My little joke about the bread has become a heart-appalling necessity. I can't go out till they come in."

"You can't!"

"Billy's asleep in the nursery. Two servants and two steadies are supposed to be in the kitchen. They're not there. Bud and Jack have gone in to town for something—back on the ten-forty-five. My going out is off till I can round up Billy's guard."

The guests departed, murmuring madelictions, and extracting from Julius equivocal promises to put in an appearance at the Merediths if it became possible, no matter at what hour.

"This is a sweet thing," said Julius to himself, sitting down in his evening clothes before the hall fireplace, an injured expression on his face. "Didn't want to go out at all till I found I couldn't. Now I'd face a tornado rather than stay in. What under the heavens could have happened to those girls?"

He took another circuit around the house, shouting vociferously. The only, and immediate, result of this was a lusty wail from the nursery.

"Now I've done it," ejaculated the victim in dismay.

He cautiously opened the nursery door and peered in. Billy was sitting up in bed, shaking the sides of his crib with both fat hands and rending the air with the vigorous howls of which a fourteen-months' healthy infant is astonishingly capable. The moment he caught sight of Julius he beat his fists upon the rails of his bed and redoubled his energy.

"Well, leave the roof on," ordered his young nephew, picking him out of his wrappings. "Come here—if you must. Hi—don't touch my cravat. Leave my collar alone, you imp. Now what in thunder am I going to do?"

He turned up the light and sat down in his sister's rocking-chair with Billy in his lap, a vague idea of rocking that young person to sleep again animating his action. But Billy would have none of the rocking-chair. Julius showd him the pictures on the walls—a charming assortment of historic scenes from Mother Goose, in the latest and most artistic guise. Billy scorned them and applied himself to worrying Julius' carefully parted hair.

"We'll go down-stairs—shall we?" asked Julius politely.

Billy crowed.

Julius descended the stairs, Billy's pink toes sticking out below his pink flannel nightgown in a most engaging way. His mother would have been distracted with anxiety at the sight.

Julius sat down before the big hall fireplace again, and punched up the fire into a roaring picture, at which Billy thrust out his bare feet ecstatically, and wound his fat fingers in Julius' neckgear.

"Now, see here," cried that tortured young man. "I won't stand it—see? You sit here on the floor while I go up and get on a bath-robe. If we've got to make a night of it we may as well do it in suitable attire."

When he came back—by way of the still deserted kitchen—he was wearing a gay-striped robe and a pair of slippers. He was collarless and cravatless, and he carried a pink-and-white blanket obtained from Billy's crib.

"I suppose in case Bud should come in unexpectedly," he murmured, as he rolled his nephew in the blanket like an Indian papoose and stood him up on end, "it might be as well to make some slight show of donig up the kid so he won't catch cold."

The moment he was seated upon the rug Billy squirmed himself free from the blanket.

"All right," said Julius resignedly; "have it that way—I don't blame you. Only when you're big enough to get onto our Yale team you will have to take care to pull on your sweater or your bath robe while you're cooling off."

The telephone bell rang.

"Hullo," said Julius, in response. "What?—can't hear you. No—can't make it out. Yes—this is Elliott's. Beg pardon—yes'm. Er—spell it, please. The storm makes bad service. Yes—what—oh—no, no—I can't get away yet, Sally. Awfully sorry—but my sister hasn't come back—and I'm alone. Oh—thank you—I'm afraid it will be too late. Er—goodby."

Coming back to stand on the hearth-rug and gaze absently down at his nephew, tumbling about gaily there, Julius delivered himself of one pregnant syllable:

"Wow!"

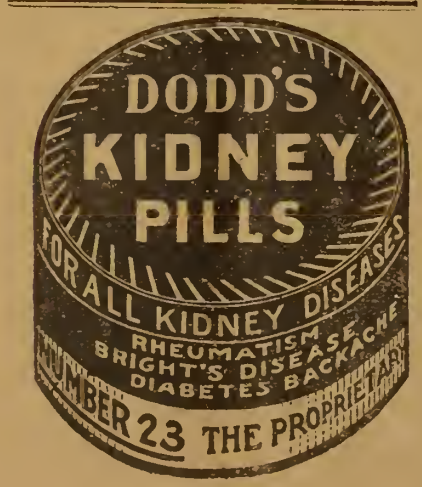
Billy looked up, caught his uncle's somber eye, and gurgled enticingly. He got no notice. He crowed. There was no response. He crept to the foot of the bath robe, parted its folds, and squirmed between Julius's black-clad legs, endeavoring to pull himself to his feet and stand within this improvised tent. Julius adjusted his pose to meet the demands made upon his physical being and his lips slightly unbent as his nephew gave a satisfied grunt from his hiding-place. Then, as Billy leaned out and forward and looked up at him once more, the brow of the Yale sophomore cleared and he addressed his companion in the genial tone to which that young man was accustomed.

"Whatever I'm doing, you're having the time of your life—huh? Downstairs at ten-thirty—and the coast clear. All right, ol man—go ahead. I won't stand in your way. Say, Billy—I'm hungry. Let's go and forage for grub"

He swept the triumphant baby up to his shoulder and marched off with him to the kitchen store-room. Here he switched on the lights and stood, surveying the shelves with satisfaction.

"Bud said I'd eaten up everything in the house the second day of my vacation," he informed Billy, "but I should judge she's got stocked up again. I don't see anything the matter with that cold roast duck—nor the remains of that lobster salad we had for luncheon. I don't see how I came to leave any, though. Perhaps she didn't put it all on—sly thing. Ha—there are some of those dandy little Banbury pies cook makes—and a pot of cream cheese—um-m-m. Billy, we're in luck."

He carried his charge to the dining-room and placed him carefully in his high chair, forgetting all precautions about the blanket and the bare toes. But Billy did not seem to mind.



HAD A VERY BAD COLD and COUGH

DR. WOOD'S NORWAY PINE SYRUP CURED HER.

Mrs. C. Dresser, Bayfield, Ont., writes:—"I want to tell you of the benefit I got from your medicine.

Last winter I had a very bad cold and cough, but after taking two bottles of Dr. Wood's Norway Pine Syrup I was cured. I think it is about one of the best cough syrups that I know of. I always keep a bottle of it in the house so I can have it when I want it.

The other week I told an old lady about "Dr. Wood's." She had been sick for three weeks with bronchitis, and had been getting medicine from the doctor, but did not seem to be getting much better. She got one bottle of Dr. Wood's Norway Pine Syrup, and she says it has done her more good than all the doctor's medicine she had been taking."

Dr. Wood's Norway Pine Syrup is rich in the lung healing virtues of the Norway pine tree, and this makes it the best remedy for coughs and colds.

The genuine is put up in a yellow wrapper; 3 pine trees the trade mark; price 25c. and 50c; manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

A MESSAGE TO WOMEN!!

LET a woman ease your suffering. I want you to write, and let me tell you of my simple method of home treatment, send you ten days' free trial, postpaid, and put you in touch with women in Canada who will gladly tell what my method has done for them.

If you are troubled with weak, tired feelings, headache, backache, bearing down sensations, bladder weakness, constipation, catarrhal conditions, pain in the sides, regularly or irregularly, bloating, sense of falling or misplacement of internal organs, nervousness, desire to cry, palpitation, hot flashes, dark rings under the eyes, or a loss of interest in life, write to me to-day. Address:

Mrs. M. Summers, Box 309 Windsor, Ont.

He twisted his feet about the legs of his chair and laughed. Julius hurried back and forth between the store-room and the dining-room, and presently had a royal feast set forth, to which he added new items even as he considered it complete. Finally he drew up a chair and sat down.

He filled his plate to the edge, and then stopped and turned to look at Billy, at his elbow.

"Why, say—you seem to be rather left out of this deal," he reflected. "What'll you have? What do you have usually? H'm—milk, mostly—and beef-tea—and soft-boiled eggs? Invalid diet—Billy—huh? What would your lovely mother say if I should treat you to"—his sparkling eye roved over the table—"a bit of lobster salad?" He shook his head regretfully. "It won't do to tempt fate, old man—but I don't see any earthly reason why you can't have one of those Banbury pies. Nothing in 'em but raisins and jam and things. Here—take it—and learn what is food for men—future half-backs, Billy boy."

The fourteen-months-old member of the party seized the Banbury pie joyously, and joyously implanted eight milk-white teeth in its midst. Julius watched him with an interested, satisfied grin.

"Good, old man?" he inquired with relish, wagging his head and smacking his lips. "Mm-m-m—you bet it is. That's it—paint yourself all over with it. Hold on—here's your bib hanging on the back of your chair. Better have it on, Bill—lovely mother's liable to notice jam on the front of your pyjamas and have it in for you. There—now go ahead—and so will I."

They went ahead. There is a charm about these stolen midnight feasts which sedater, sanctioned banquets lack. Billy finished the Banbury pie—such of it as did not fall upon the floor and the tablecloth, the bib, and even the eater's own bare toes. Julius consumed to the last crumb the varied menu which he had prepared, then leaned back in his chair, unbuttoning the white waistcoat which he had forgotten to remove when he dressed for the revel.

"You've had your first orgy, old man," he said gaily to his nephew, "and it was a good one. It's a pity you're too young to remember it. There's nothing about it that will ever give you pain to remember either—that is to say, if you get through the next few hours without any. If you show up with the colic tonight your Uncle Julius will never spree it with you again, Bill; so be wise and conceal your feelings—if you have any. What—more? Oh, no, sonny—you can't have more—there isn't any. Want me to take you? Certainly—but let's go to the bathroom and remove some of the stains of battle. Look out—keep your fists off my waistcoat—Oh, say—"

There was the rattle and thud of the outer vestibule door. Julius glanced in dismay at the Swiss clock on the dining-room mantel.

"Billy," he murmured, "we're caught. We're up against it. Explanations are in order. Where's your blanket? It's in the hall, Bill—she'll see it the first thing."

The electric bell whirred sharply, and whirred again. There was a sound as of the stamping of feet.

"Forgot their latch-key," growled Julius. "Wonder if I've got the force of character to keep 'em waiting while I plunge this kid into bed. Huh—no?" —as a fresh demand of the bell announced the importunity of those waiting outside. "Well—hold on there—let me collect my nerve. We'll get your blanket on, Billy, before we face mother."

He hurried into the hall and dashed the blanket about his nephew—with the customary result of a masculine endeavor to wrap up an infant that Billy's toes protruded from the bottom of his wrappings as naively as ever.

"Keep cool, old man," muttered Julius as he approached the door. "We won't look any guiltier than we can help. Gurgle at your mother and take her attention off me, will you?—there's a good pal. Her goes—they're getting mad, and I've got to——"

He flung open the door. A great laugh made up of seven different qualities of voice, three deep-toned and exulting, four high-keyed and rapturous, filled the hall. Julius fell back before the onslaught of the party who had spent the evening at the Merediths'.

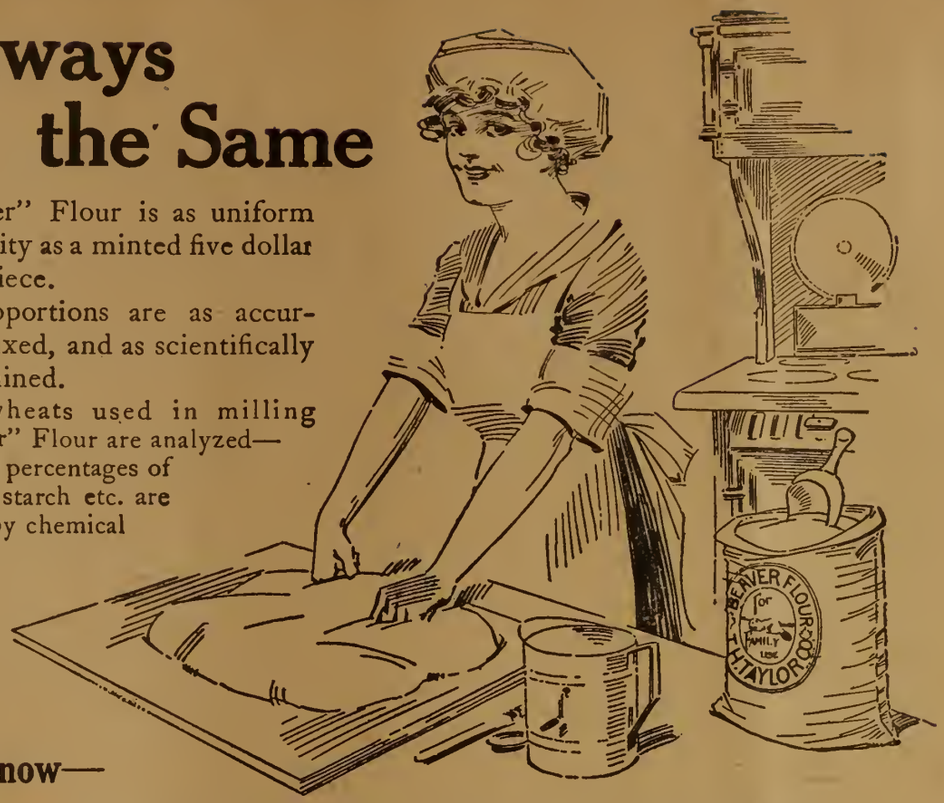
"Oh—I say—" he began, and words failed him. But the guests continued the conversation for themselves.

"Hi—look at the family man!"

"See the faithful fellow at his post. next year's breeders. If October 1st be He should be awarded at least an 'Honorable Mention.'"

(Continued in next issue.)

Always the Same



"Beaver" Flour is as uniform in quality as a minted five dollar gold piece.

Its proportions are as accurately fixed, and as scientifically determined.

The wheats used in milling "Beaver" Flour are analyzed—and the percentages of gluten, starch etc. are found by chemical tests.

We know—

from years and years of experience—just how much western spring wheat to add to the choicest Ontario winter wheat—to obtain the desired strength.

BEAVER FLOUR

Equally good for Bread and Pastry. ***Milled of Blended Wheat.***

This is why "Beaver" Flour always gives good results—why it requires less shortening—why everything you make with it has a flavour that you cannot get with western spring wheat flours. Try "Beaver" Flour yourself for both Pastry and Bread—you'll find it equally good for either, and best for both. Remember, to insist on having "Beaver" Flour—the original blended wheat flour.

DEALERS—write for prices on Feed, Coarse Grains and Cereals.

HOW TO PLANT TREES AND SHRUBS.

Thousands of newly set trees and shrubs perish within a year or two just because they are not planted properly. This result may be to the advantage of the nursery-man, but it is discouraging to the purchaser. As a rule, though, a little intelligent care in starting trees and shrubs will insure their rapid growth and development. Nursery stock is much like a human baby—it must be coddled a little, kept vigorous, and trained from the beginning in the way it should go. Much depends on the way the stock is handled when it is received. If the roots are exposed to the spring winds for only a short time, they are in danger of perishing. When planting can not be done at once, heeling-in should be practised.

This means digging a trench and setting the plants into it, closely, and at an angle. Then the roots are covered with earth, a little water given, and more earth added. When heeled-in like this, the trees or shrubs will remain in good condition until they can be placed in their permanent location.

At planting time, the roots may be kept under a wet blanket or in a barrel of water. Dipping them in thin mud will help to keep them from drying out. The point to remember is that exposure to the air is likely to result in serious injury.

The next proceeding depends upon the nature of the planting. If a block of fruit-trees is to be set, the land should be carefully and regularly laid out allowing the same amount of space between each tree—forty feet each way, we will say, if the trees are apples of standard varieties. This will allow twenty-seven trees to an acre.

How Holes Should Be Dug

But whether orchard trees on the farm, or street trees along the highway, or ornamental shrubs around the house, they should go into holes which are large enough to receive the roots without cramping them. It is right here that amateurs often make a serious mistake. Digging is not work of the kid-glove sort, to be sure, but a tree or shrub must not be jammed into a hole only half large enough, if it is to thrive. The hole should be as large at the bottom as at the top and preferably a little lower around the outer edge, so that the roots will slant downward slightly.

These roots should be spread out carefully, but first they should be trimmed of broken and bruised ends, a sharp knife being used and a slanting cut on the under side made. More or less of this work is almost always needed.

Sometimes manure is used at planting time, but generally can better be dispensed with, as it tends to dry out the soil; and the nourishment will not be needed for some time. In any case, the amount of manure should be small, it should be well rotted and it should be thoroughly mixed with the soil. As a rule, newly set trees will need no fertilizing until the second year.

It is very important that the soil thrown into the hole after the tree has

SHARP PAINS SHOT THROUGH HEART.

Thousands of people go about their daily work on the verge of death and yet don't know it.

Every once in a while a pain will shoot through the heart, but little attention is paid to it at the time, and it is only when a violent shock comes that the weakness of the heart is apparent.

There is only one cure for the weak heart and that is Milburn's Heart and Nerve Pills.

Mr. H. A. Young, 83 Hayter St., Toronto, Ont., writes:—"I used to have sharp pains shoot through my heart, suffered from shortness of breath, and was so nervous I could not sleep at night. A friend advised me to try Milburn's Heart and Nerve Pills, and after one box I found great relief. Three boxes completely cured me."

Milburn's Heart and Nerve Pills are 50c. per box at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

been set should be well worked in around the roots. Careless planting in this respect is always punished.

Filling In

When small shrubs are being set, the earth may be worked among the roots with the fingers, which do the work better than any tool. After the excavation has been partly filled, several pails of water may be thrown in and will help to carry the soil into all the crevices around the roots. After it has soaked away, the hole may be filled almost to the top and the earth tramped down very solidly with the foot or a maul. Then a few inches of loose soil may be spread on top to act as a dust mulch and prevent the evaporation of moisture. Generally it is well to mound the earth a little higher than the surrounding ground in order to allow for settling.

Most experienced men say that the planting should be a trifle deeper than it was in the nursery row—perhaps an inch deeper. A dark ring on the stem will indicate where the earth came before.

Trees and shrubs apart from evergreens should be trimmed severely when they are planted. The extent of the cutting back may be gauged by the size of the root growth, but it is probable that nearly half the roots are torn off or damaged when a tree is taken up, so they should always be pruned generously. Roses, in particular, should receive severe cutting back, usually to two or three eyes on each strong shoot. Most shrubs will bear cutting back one-half. The top must be made to balance the root system or the latter will be overtaxed.

It is especially important to start fruit-trees right. The ultimate shape of the tree will depend largely upon this first trimming. Low, open heads are wanted on fruit-trees, so that the sunlight and air may be permitted to reach all the leaves and fruit. Then a low-branching habit must be fostered from the beginning. Let it be remembered that a limb never becomes any higher than where it starts.

Branches which cross should not be permitted and it is not well to have more than two parallel branches one above the other. If there are two branches directly opposite each other, it is well to remove one, and so forestall the probable splitting of the trunk later. The shaping of the tree may be controlled by cutting back the branches to three-eighths of an inch above a bun pointing in the right direction.

It is customary to cut the main stem of fruit-trees back to from twelve to twenty inches. Peach trees are often trimmed to a mere whip, but apple and pear trees, if vigorous, may be left with branches cut back to six os seven inches, the branches being carefully cut just above a bud pointing out rather than toward the center of the tree.

What has been said about pruning newly set trees does not apply to evergreens. Because of the fact that they can not be pruned, extra care should be taken to have the soil thoroughly worked in around the roots.

Many people use a mulch of straw or leaves several inches deep round newly planted evergreens, and this plan is a good one in the case of any tree, unless one is prepared to keep the surface continually stirred in order to maintain a permanent dust mulch.

When trees and shrubs are purchased, it is not always an advantage to get those which are large, but it is important to have them strong, with good roots.

LEAFLESS APRIL

Leafless April chased by light,
Chased by dark and full of laughter,
Stays a moment in her flight
Where the warmest breezes waft her,
By the meadow brook to lean,
Or where winter rye is growing,
Showing in a lovelier green
Where her wayward steps are going.

Blithesome April, brown and warm,
Showing slimness through her tatters,
Chased by sun or chased by storm—
Not a whit to her it matters.
Swiftly through the violet bed,
Down to where the stream is flooding,
Light she flits—and round her head
See the orchard branches budding.

—Miss Ethelwyn Wetherald.

OUR HERITAGE

A Plea for the Farm by a Daughter

I speak from the standpoint of a farmer's daughter, who realizes the extent of such a heritage. Why are our sisters leaving their farm homes, preferring to stand for long hours behind the counter or over the monotonous click of the typewriter to a life in the country? For various reasons:—

They have been fascinated by the glitter and bustle of the crowds. They have occasionally seen their city cousins idly lolling away the warm morning in the hammock with a magazine or recent novel or promenading shady avenues in the daintiest of white in the afternoon or perhaps on a mild winter day hurrying along with a bunch of jolly chattering companions with their skates.

All this and many other equally attractive scenes are very apparent and naturally appeal very strongly to the girls whose every minute is a busy one.

But the sham; the peevish discontent of the unoccupied seldom comes to light and hence we find that so many of our bright, capable country girls, laboring under a mistaken view of life are watching with eager interest from behind their counter, the constantly changing crowd of shoppers and sight-seers.

Why, after all is it called drudgery? Van Dyke tells us that "the blessing of earth is toil." In so many cases it is hard to see the blessed side of it, but the very fact that we live in Canada, where farm life is so free, open and usually prosperous is a blessing.

We do not have to contend with the burden of much calling and receiving. Our meetings together in the country are usually very informal (glory be). This enables us to spend more of our time out of doors in God's pure air and sunshine unspoiled by factory smoke and six-story brick walls.

We scorn the services of a hired gardener and love to dig our own flower beds, then plant them and keep them clean. We delight in training our own vines and trimming our own grass. In the busy mid-summer this pleasure is often taken after a long hard day, but is such a satisfaction that it proves worth while.

If you don't already possess a natural love for animals, cultivate it. Call them each by name. Pet them until they learn to expect it.

It is strange that so few girls know the exhilarating joy of horse-back riding. Besides being a pleasure, it is a very strengthening exercise. The writer by means of a lump of sugar can coax any horse in her father's pasture to let her on its back and can ride at a brisk canter to the stable without saddle or bridle; and when riding on the King's highway she wears a neat khaki divided skirt and rides astride.

It is a most enjoyable and easy way of getting around. Besides that one can go more frequently and at much shorter notice, rather than hitching to a buggy.

The girl who enjoys all this must, however, guard again it becoming a hobby to such an extent as to make her uninteresting to unsympathetic acquaintances. Oh yes, there are always some who do not understand and are loud with adverse criticism, but "Do right and fear naught." Many people make themselves miserable by fearing what will be thought of them.

This danger, however, can easily be avoided; mingle freely with the best young people of your neighborhood. Read the daily papers and absorb the important items. Read books of the best authors and be able to discuss them intelligently and advance your individual opinions. See and appreciate all the beauty, that life offers. Be loyal to your friends and live a life of the greatest possible service to others.

The life on the farm is the only life that offers all these golden opportunities. Our hritage truly is vast. Accept it and rejoice.

TO PLACE ALL ON EQUAL BASIS

Uniform Administration of Military Service Act Sought By Questionnaire Method

The great crisis through which the world is now passing has served to emphasize among a great many other things the axiom that responsibility is the price of liberty. Because equal privileges are enjoyed by all citizens of Canada, it is the duty of our Government to see, as far as it is abe, that all are made to bear equal sacrifices. That the Dominion's War Government is not unmindful of its duty in this respect is evidenced from the care that is being taken to ensure the equitable administration of the Military Service Act. Questionairres are about to be addressed to all exempted men so as to permit of a checking of the decisions in the case of each to the end that uniformity be established in the application of the legislation. These questionnarries must be returned promptly under penalty of forfeiture of the exepmtion papers previously granted. Exempted men should notify the registrar of their district of any change of adderss, as non-receipt will be regarded as constituting failure to return questionnaire, properly filled in as required. The Government is determined that the Military Service Act shall be administered fairly, and in this determination they will have the active support of all followers of democratic ideals.

Cocoa

4 tbsp. cocoa, 2 c. milk, 3 tbsp. sugar, 2 c. water, pinch of salt.

Mix cocoa, sugar and salt, add water and boil 10 min. Add milk and let come to scald. Beat until thick froth forms to prevent scum forming.

THE FARMER AS A TRAINED SURGEON IN THE ORCHARD AMONG WOUNDED TREES

(Continued from page 425)

will be eventually grown over. The other side has a circular opening to allow for a washer. The cavity and bolts are then creoseted and later fumigated to kill any borers which may be in the sound wood. For this purpose a teaspoonful of carbon bisulphide is used to every cubic foot of cavity, the entire opening being covered with cloth or tar paper, and a piece of cotton saturated with the solution, dropped into the cavity. If the cloth does not allow the fumes to escape, the borers are killed over night. The cavity is then ready for filling.

The material most commonly employed is concrete, either a dry or wet mixture of one to four. The best Portland cement should be used, coarse sand, and ½-inch gravel. No reinforcement is necessary, except the bolts, as it will not prevent the cracking which is bound to occur because of the swaying of the tree. Moreover, the strengthening effect of the reinforcement is questionable because an inelastic substance like concrete cannont strengthen the elastic wood. The dry mixture is the easier to use. The concrete should be mixed so that it will not crumble, and is then laid in the cavity and brought out to within ¼ inch of the cambium layer. It is very important that the filling should be below the cambium to permit it to grow over eventually. The surfaceo fthe filling may be gone over with mortar to give it a smooth finish, and after drying out a coat of tar or fluxed asphalt is applied to make the concrete waterproof. The "dry" concrete has the disadvantage of disintegrating, as air spaces are left which are penetrated by water and the cement leaks out. The "wet" concrete method necessitates the use of a form. This may be made of wood, but that is not economical and requires driving nails ito the bark. A wire netting is better, which may be inserted into the cavity, the concrete poured in and then faced with mortar made of a mixture of cement, lime, sand, and water (one part of cement to two of lime and sand). Still another method requires the use of oilcloth. Two sticks should be placed o neither side of the opening and tied at the bottom by a rope run ning around the trunk. A piece of oilcloth sohuld then be cut to fit over the opening. It is tacked at the top, while the bottom is held in place by soil being banked against ti. Beginning at the bottom a strip of canvas should be run from post to post to act as a suport for the cloth. When 18 inches from the ground is reached the oilcloth is turned back and into the form the wet concrete (1 to 4) is poured. Then a piece of newspaper or tar paper is laid on top to serve as an expansion joint. The canvas strips are again run up 18 inches and the opera tion repeated until the cavity is filled. In order to prevent the concrete from coming out to the surface of the bark it is necessary to remove the oilcloth in ¾ hours, cut off the surplus mater-

These are Anxious Days

NEVER in the history of this old world have the people lived under such tremendous nervous strain as to-day. Millions awake each morning in fearful dread of what the day may bring forth, and live each hour with nerves at highest tension.

While many are falling under the strain, others have found one means or another of fortifying the nervous system so as to maintain health and vigor.

The treatment most widely used is Dr. Chase's Nerve Food, popularly known as the food cure, because it feeds the exhausted nerves and stores up nerve force and nervous energy.

Nothing breaks down the nervous system so quickly as worry and anxiety, and this is why so many people are suffering from nervous headaches, sciatic and neuralgic pains, nervous indigestion and general failure of the vital organs to properly perform their functions.

When you get so nervous that you do not rest and sleep well nights it is time to be alarmed, for it is very much easier to prevent nervous prostration, paralysis and locomotor ataxia than it is to cure these dreaded diseases.

After years of testing under the most severe circumstances Dr. Chase's Nerve Food stands in a class by itself as the most successful nerve restorative to be had. This is being proven every day by new evidence. Ask your neighbors and friends about it and read the reports in this paper, from time to time, from persons who have been cured.

Dr. Chase's Nerve Food

50 cents a box—do not pay more—at all dealers or Edmanson, Bates & Co., Ltd., Toronto. On every box of the genuine you will find the portrait and signature of A. W. Chase, M.D., the famous Receipt Book author. 5

RELIEF AT LAST

I want to help you if you are suffering from bleeding, itching, blind or protruding Piles. I can tell you how, in your own home and without anyone's assistance, you can apply the best of all treatments.

PILES TREATED AT HOME

I promise to send you a FREE trial of the new absorption treatment, and references from your own locality if you will but write and ask. I assure you of immediate relief. Send no money, but tell others of this offer.
Address

MRS. M. SUMMERS, Box 309
Windsor, Ont.

ail, bringing it back below the cambium, and face the filling with mortar.

Tinning a Cavity

Asphalt mixed with sawdust or excelsior is another "filler." Small cavities are quickly traeted by tinning, a ledge ¾ in. wide and ¼ in. below the cambium being left all around the opening. A pattern is made to fit the tin cut, and both the inside of tin and of cavity painted. The metal is nailed to the ledge with galvanized nails, on e inch apart. After the first year the callus grows over the nails, and the tin is secure.

Where appearances do not count, the "open system" may be used; the entire cavity is cleaned out and painted, no filling being used. It is cheap, keeps out insects and fungi, and is as effective as filling, though lacking in strength and beauty.

Mechanical Aids

Bracing is essential to prevent wounds and consequent decay. For best results an eye-bolt should be run through the limb and connected to another eye-bolt inserted in the trunk, by means of cable rope or iron rods. The cable is rather difficult to work but after it is up, is the most satisfactory of any braces. In bracing small limbs several trands of galvanized wire should be run through the two eye-bolts, then bound together with a wire, and tightened by screwing on the put of the eye-bolt. The eye-bolt will vary from ⅜-¾ inches depending upon the size of the limb. The braces should be placed as high as possible, for, according to the physical law of lever and fulcrum the further from the crotch is the support the less strength is required. Small trees may have their limbs braced by means of large screw eyes and fence wire, or the wire may be run through an opening in the limb double its diameter, and back again. A groove should be made at the back of the limb and a nail inserted under the wire to pre-

vent it from slipping out.

Limbs that have been partly severed may be put in place, the wounds covered with liquid grafting wax, and then braced to the nearest healthy branch. This will sometimes save trees seriously damaged by windstorms or lightning.

FACTORS INFLUENCING CROP YIELDS

(Experimental Farms Note)

Crops require moisture, heat and food in suitable amounts and proportions to make rapid, strong growth. Nature supplies the essentials for life and growth, the farmer's task and problem is to utilize these resources in such a way as to ensure satisfactory yields. Investigations conducted at the Central Experimental Farm, Ottawa, have led to the conclusion that the following factors exert a telling influence towards increasing crop production.

Underdrainage.—Probably the most important and indispensable where the rainfall is great.

(a) To carry off surplus water.
(b) To allow air to enter the soil.
(c) To aid in raising the soil temperature.

It is equally a necessity in soils where moisture conservation has to be considered. Drainage lowers the natural water table in the soil leaving the soil in shape to absorb rain as it falls, that is preserved for use of crops.

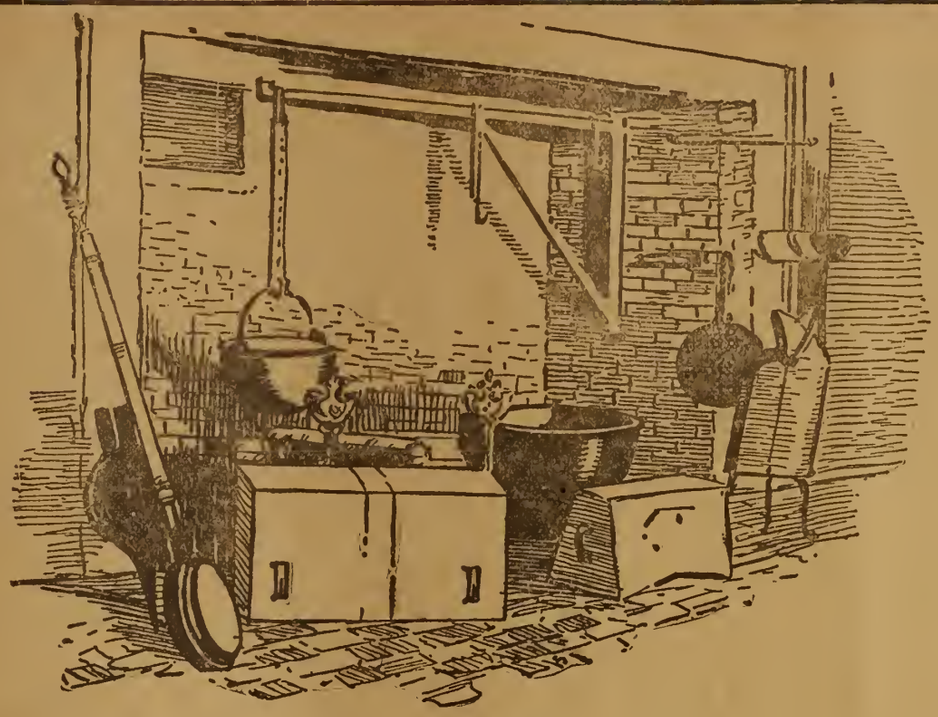
On the whole drainage improves the mechanical condition of the soil and assists in influencing the liberation of plant food elsewhere.

Plant Food.—In the proper proportions for the different classes of crop to be grown. This provides the adoption of a good crop rotation. This rotation should be a short one, say of 3 to 4 years' duration, and the order of crops is most important. Crops such as corn, roots, potatoes and hay, require large supplies of food from the soil for stem, leaf and root growth. This may be most easily supplied by the clover or other sod turned down, or by heavy manuring. The cereals such as wheat, oatas and barley required less of this food and generally do best if sown the year following an application of manure. The area sown to these cereals, if seeded down to clover and grasses, will supply a hay crop the third, or the third and fourth years, and the sod turned down, manured if necessary, fits the land for corn or roots once more.

Such general plan of rotation may be modified by each farmer as will best suit soil and needs, but some such scheme is necessary in order that humus, probably the most valuable of all soil constituents, be added and maintained in the soil, to keep it in good producing shape. Humus decomposed and decomposing vegetable matter is provided in applications of barnyard manure, in legume crops such as clovers and in green manuring crops like buckwheat. Humus absorbs and holds moisture and is a means of raising soil temperature since dark soils absorb heat readily and rapidly.

Manure.—Barnyard manure is most effective fertilizer and furnishes humus forming material. Fresh manure gives crop yields almost equal to those from rotted manure and when applied directly it can be handled more economically with regard to labor. Manure should be spread evenly and incorporated thoroughly with the soil. Applications should be made in moderate quantities frequently rather than in large quantities at long intervals. Apply the manure for hoed and clover or other hay crops in a suitable crop rotation which provides that each field in the farm will receive regularly its fair share of manure.

Proper Cultural Methods.—To make a good seed-bed requires thoroughness in carrying out each step in its preparation.



Baking Day in Grandmother's Kitchen

GRANDMOTHER did her baking in tin kitchens set before the fire. Sometimes she baked a sponge cake in an iron kettle, browning the top with hot coals heaped on the lid. On baking day the kitchen was filled with delicious fragrance because Grandmother made her cakes and pies with *old fashioned brown sugar.*

Gone are the cranes and bellows and tin kitchens but we still enjoy Grandmother's favorite dishes. Mince pies, plum puddings, cakes and many sweets and beverages are much better made just as she made them with soft brown sugar. It is easy to get both the recipes and the sugar with which to make them up. *Lantic Old-Fashioned Brown Sugars* come in three kinds —Light, Brilliant and Dark Yellow—and are for sale by grocers throughout Canada. Brilliant Yellow is particularly good for baking. *Grandmother's Recipes* have been reproduced in a delightful little book which we will send to you for a 2c. stamp to cover cost of mailing.

Lantic
Old Fashioned Brown Sugar

is put up only in 100-lb. bags with the well-known Lantic trademark from which your grocer will serve you any quantity you require. Our booklet tells you among other things how to keep brown sugar fresh, moist and ready for use.

Lantic Old-Fashioned Brown Sugars are made by the same firm that makes the famous Lantic "FINE" Granulated.

STERLITY OR BARRENNESS IN COWS

(Continued from page 427)

she is permitted to walk about a sheltered yard daily.

Immediately after calving the cow should be given a drink of warm water. In a few hours a warm bran mash and some clean, bright hay may safely be fed her. It is always better to feed light rations of bulky feeds for the first few days. As a rule roots are preferable to silage until the cow partially regains her normal condition. If the cow cleans promptly, much trouble will have been avoided. If she does not clean within 24 hours, veterinary aid should be summoned.

As the cow regains her normal condition her grain and roughage ration may be gradually changed until she is getting all she can make good use of at the end of the month. I like to bring the cows up to their normal production by the end of the first month after calving.

One point that should have particular emphasis, is to increase the ration gradually. Never add more than one-half pound of grain a day to the cow's ration. Increase at that rate for three days; then rest the cow for a week and give her digestive system an opportunity to adjust itself to the increased amount of feed. Then it is safe to go on and increase the ration, but never more than one-half pound of grain a day. If the scales show that at any time the cow is falling off in her yield of milk, it is pretty good evidence that she is getting more feed than she is capable of handling, therefore, her ration should be reduced until she begins to decrease her yield of milk. A study of the cow herself is the only safe guide as to how much feed she is capable of digesting and assimilating. LESTER J. MEREDITH

CURING MEAT FOR SUMMER

I have been curing pork for summer now for 17 years, and I cure from 500 to 800 pounds annually, and never have any losses through the hams and bacon going bad. It is the old country plan of dry salting that I use. I never smoke the cured meat. We have not yet finished the bacon cured last March. I always use the best pigs I have; those from eight to ten months old, and weighing from 200 to 250 pounds live weigth. I make it a practice not to use the sow pigs unless I have not enough of the barrows. The only reason for this is that I can kill just when I wish, and most men know there are certain times when it is not advisable to kill sows.

In killing it is very essential that the pig be bled right. I roll it over on to his back and stick the knife just in front of the breast bone and fair in line with the root of the tail. There will be no harm done if the knife touches the heart. To clean the pig I always immerse in scalding water and see that hairs and scurf are cleaned off as thoroughly as possible. After taking out the insides I let the meat hang until cold, but not freeze, unless the pig was very small and the sides very thin. I take the ribs out and cut off the ham, leaving the sides and shoulders intact. I also cut off the feet at the knee. It is then ready for the salt. I take a steel, an ordinary butcher's steel, and shove it into the ham down through the shank about six or eight einches and put in the hole half a teaspoonful of saltpetre. I then fill up the hole with salt. I also do this with the shoulders.

Preparing the Sides

I then take the side and shoulder all in one piece, as I said before, and lay it on a table in the cellar, skin side down. I take first one or two tespoonfuls of saltpetre and sprinkle over the meat fairly liberally just at the soft part of the shoulder; very little on the thin part of the meat. I then take two tablespoonfuls of brown sugar and put on the soulder as far down as the thick meat goes. Then give it a fair good covering of salt. The meat will only take so much salt in a certain time so it is really immaterial how much so long as there is enoug, but it is not necessary to put much on the belly part for the brine will run int that. I put a piece of board under th low side of the meat to hold it up s that the brine will not run off. I d

"Why swelter over a coal or wood range this summer?"

"What else can I do?"

"I have a McClary Florence Oil Stove and it makes kitchen work in summer a pleasure."

"You can cook or bake anything with it just as well as with any other stove. You can move it anywhere."

"No, there are no wicks or valves on it."

"It burns coal oil and the feed is automatic."

"You can regulate the flame for any kind of work."

"I wouldn't be without mine for anything."

"McClary's will send you a booklet free if you write for it."

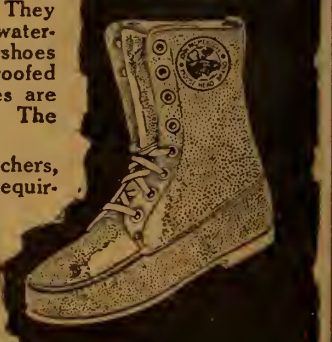
Palmer's Summer Packs

JOHN PALMER CO. Ltd TRADE MARK MOOSE HEAD BRAND REGISTERED FREDERICTON N.B.

GIVE real foot comfort to tired, aching feet. They are made from oil-tanned Skowhegan waterproof leather. These summer packs or plow shoes are light, strong, durable—made with water-proofed leather sole and heel and solid leather insoles are laced, have large eyelets and bellows tongues. The ideal shoe for working on the land.

They are also specially suitable for ranchers, trackmen, laborers, sportsmen and all others requiring extra strong yet comfortable footwear.

The style shown—No. 109, is nine inches high. Ask your dealer for Palmer's famous "Moose Head Brand" footwear—many styles and sizes to choose from.



JOHN PALMER CO., Limited
Fredericton, N. B., Canada. 30

this with sides until finished, although four sides are neough for one stack. Just put one on top of another and see that you put the thick part of the meat of one side where the thin part is of the one before it, to keep it level.

Treating the Hams

..I next take the hams, and as I said before, put the saltpetre and salt down through the shanks, then lay them skin down as level as possible. On top of the sides put a teaspoonful of saltpetre on each liberally around the bone, then a good teaspoonful of brown sugar. Then cover with salt. Four hams can be placed on top of the sides without any trouble. The job is then done for ten days, when I just take my stack to pieces and put it together again, only I put a different side at the bottom and a little fresh salt where it is needed. I then leave it for another ten or twelve days, and after that I take the salt off, stand it on edge and drain, then hang up to dry. I like to get this done before the flies get around, for no matter how careful one is the flies will get there first some time or other. After the meat is dry it can be either left hanging in the pantry or packed in oats.

SAVING GASOLNIE; FOURTEEN "DON'TS" TO REMEMBER

Display the Placard and Obey it Yourself

Here are fourteen ways of saving gas as suggested by the U. S. National Chamber of Commerce.

1.—Do not use gasoline for washing or cleaning; use kerosene to cut the grease.

2.—Do not spill gasoline or let it drip when filling; it is dangerous and wasteful.

3.—Do not expose gasoline to air; it evaporates rapidly and is dangerous.

4.—Do not allow engine to run when car is standing. Cars are fitted with self-starters, and it is good for the battery to be used frequently.
use leanest mixture possible; a lean mixture avoids carbon deposits.

6.—See that piston rings fit tightly and cylinders hold compression well. Leakage of compression causes loss.

7.—Stop all gasoline leakage. Form the habit of shutting off gasoline at the tank or feed pipe.

8.—See that all bearings run freely and are lubricated; friction consumes power and wastes gas.

9.—Protect the radiator in cold weather; a cold engine is hard to start and is shor tin power.

10.—Keep tires fully inated; soft tires consume power.

11. Do not drive at excessive speed. Power consumption increases at a fast rate of speed. Every car has a definite speed at which it operates with a maximum fuel economy.

12.—Change gears rather than climb with wide open throttle; it saves car and gas.

13.—Do not use cars needlessly or aimlessly. With exercise of forethought a number of errands may be combined so that one trip to town or elsewhere will do as well as two.

14.—Reduce the amount of riding for mere pleasure by shortening such trips or cutting down their frequency.

THE HORSEPOWER OF WINDMILLS

The suggestion is often heard that the wnidmill should be used for power purposes on the farm. To try to use a single mill for power purposes would be like trying to use a dog for draft purposes. A large mill running in a strong wind will seldom develop as much as five horse power. If its power can be steadily absorbed, as by a storage battery, and then used at higher rate for short periods, it will do very well. One of the best types of windmill, steel, 12 feet in diameter, in a 25 mile wind develops only one and a half horse power. The 16-foot mill under the same conditions, develops about two and a third horsepower. Europe uses windmills in batteries, a number of mills working together—for power purposes, and possibly Canada will find it desirable in the future to get power from the air.

CHEVROLET

Crowd more into the busy day

THE Chevrolet 490 is an investment, not an expense or luxury. Doctors, business men, farmers, salesmen and ladies—all should use the Chevrolet Four-Ninety and crowd more energy, activity and business into the busy day.

The Four-Ninety stands unchallenged in its price class. The electric starting and lighting equipment is most efficient. The car is powerful, roomy, comfortable and economical. The time gained by operating a Chevrolet more than pays for the cost. There also are two larger Chevrolet models on display at the dealers.

MORE MILEAGE FROM THE TIRES

"It is surprising how many extra miles a tire will deliver as the result of the observance of a few simple rules," said an officer of a large tire company. "These rules are so easy to put into practice that it is a wonder that motorists do not flock into service stations to elarn them, instead of requiring so much effort on the part of the manufacturer and the dealer to impress them upon the motorist. Fully 60 per cent. of all the tires used go out of service prematurely because of insufficient inflation; 30 per cent. more go out of commission because of neglected tread cuts; the remaining 10 per cent. go to an early grave because of wheels out of alignment, brakes working unevenly, and other minor causes."

CULTURAL METHODS FOR EASTERN CANADA

(Experimental Farms Note)

Soil management or cultivation in its several phases is a very important factor in crop production. On the Central Experimental Farm, Ottawa and several of the branch Experimental Stations in eastern Canada, methods have been investigated for several years. The results obtained have warranted the following recommendations being made as applicable to average conditions on eastern Canada farms.

Cultural Operations and Implements

Ploughing is the basic cultural operation. It is therefore important and should be performed with care and judgment. No definite rule can be laid down as to the best method of ploughing. A safe rule, however, is to plough only when the soil is in shape, not too wet especially if of a heavy clay nature. Plough deeply in autumn, as deep as the surface productive soil will allow, turning an up-standing furrow. Plough shallow in spring, turning a low-lying o rflat furrow. Plough well, turn all the land and finish with straight even furrows and lands. Let the ploughing be a credit to the farmer a reflection of his character, a standard for other operatonis and an incentive to less thorough, though willing workers to do better.

Harrowing.—Of the several implements on the market for performing this work the disc harrow is the most suitable for preparing soil for seed arter it has been plowed. Thorough cultivation at this time is indispensable and the disc harrow should be used until the surface of the seed-bed is smooth and friable and the soil immediately below is firm and solid.

The drag or spike-tooth harrow, too, may be employed advantageously in seedbed preparation especially follownig the disc or roller to restore a mulch or blanket of soil to check evaporation of moisture. It is also a useful implement in the corn field a few days after sowing corn and after the corn is up to stimulate a rise in temperature in the soil, to destroy small weeds and encourage germination of weed seeds and to restore the essential mulch.

Seeding.—This operation is now done by means of seed drills. Several types are on the market but the single disc drill is probably most popular.

..Rolling.—The roller is too frequently used to put a finishing touch to the field after seeding. It may be so used to advantage on light soils but even then should be followed by the drag harrow to break the smooth surface. The chief use of the roller, however, should be to firm and crumble the soil before seeding. It should not be used on very damp soil, especially clay; let the surface dry first then use the roller to break the crust.

Where implements are to be purchased it should be borne in mind that larger implements requiring from three to six horses handled by one teamster provide a means of solving to some extent the present manual labor problem. Besides, the work done in this way is accomplished economically and thus tends to keep down the cost of production of crops.

Ploughing may be speeded up by using two-furrow ploughs.—Double disc harrows make a thorough seed-bed in the least time. The horse disc seed drill is efficient. More sections added to the drag harrow reduce the time required for this work.

ECONOMIZE LABOR AND SAVE ENERGY IN FARM WORK

One of the biggest problems in the world today is how to save wasted energy. It is seen on every hand. Men and women everywhere are trying to do things for which they have no liking, or disposition to excel in, but simply because a combination of circumstances has placed them where they are, and they neither have the gumption nor common sense to change their position. It is a safe proposition to

CROWN BRAND

NAME .....

ADDRESS .....

say that all the useful work of the world could be accomplished at one-half the expenditure of energy that is now exerted if all were wisely directed and everyone working where they could obtain the best results at the least possible outlay of time and effort. A one-time popular and amusing pastime for the young folk, very well illustrates this truth. The outlines of a donkey without a tail were drawn upon a large sheet of paper and hung upon the wall. Those present then took their turn at being placed in the centre of the room, blindfolded and given the donkey's tail to place in the proper position to complete the drawing. Before starting he or she was given two or three turns around to confuse their direction and then told to go. It is needless to say that very seldom did the tail reach its correct location; it was more likely to be pinned on the nose, the back, or the leg of the disfigured quadruped. "Wasted energy!" And yet much of the work of the world is being done just about as blindly as the object of the joke referred to.

All men, and women too, and even the boy and girl can do some one thing better than anything else. Why then, in the main, as their life's work, or as a part of the business in which they are engaged should they not do that thing largely to the exclusion of other things?

On the farm it is a wise provision, no doubt, for all members of the family to become familiar with all kinds of work, but when this is accomplished would it not be better for each one to devote himself or herself to some department in which to become specially interested and which could be, and in all probability would be pushed to a successful issue. The same principle will apply to employees on the farm. If one man is a particularly good plowman, why should he not be kept at that particular job instead of allowing other inferior workmen to do part of that work in an unskilled manner and thus to a large degree interfere with the success of the crop to follow? Perhaps another man has a taste for the livestock end of the business and would take a deeper interest in it that would insure success in his particular line. In all of these or any misfits about the farm, there is a big element of "wasted energy." The plowing that is well done will go a long way toward securing good results in the crop that is to follow. If it is not well done a great amount of extra labor will be required to overcome the ill effects of bad workmanship, a timely sowing will likely be prevented and a much inferior crop result.

On the other hand had the second man been employed at some other phase of the work that he could have done well, or at some other job altogether, no doubt success would have been much more probable at both ends of the effort instead of a partial success only or even a failure.

Now and again a good all-round man is to be found; but today they are very scarce, and becoming more so every year, hence the importance of eliminating waste in applied energy, should be one of the economic studies of up-to-date agriculture. In other lines of business where the labor question has been studied in a far greater degree than on the farm, the workmen in a large measure apply themselves to one line of the business only and so become experts in their department, and while the principal cannot be carried to the same extent on the farm, it is, at east applicable to some extent, and will no doubt work out to the advantage of many farmers who employ several men to accomplish the farm routine of labor.

"Wasted energy" can also be eliminated from other departments of the farm as well as in the matter of the distribution of labor. Any management that causes a man to walk farther than is actually needful to do his ordinary work or chores is wasten energy. Buildings are frequently placed in positions that operate against economy of labor. If possible they should be built and the internal arrangement made to accommodate itself to the idea in hand. Cows should be near the feeding chutes, calves near or convenient to the skimming room and the pig pens and horses where they can be fed without going across a dirty yard to get to them.

Method of work eliminates waste. If one knows exactly what to do next without stopping to think and leaning against the side of a barn to plan it out, every time he repeats the operation, he will not only do much more in the same time but will not be likely to overlook some important part of the work which is not true of hap-hazard labor.

To this end also the old adage "A place for everything and everything in its place," should always hang up in front of a man's memory or better still in a conspicuous place where it will be a daily reminder if its valued teaching. nOe that is always looking for his working tools is never in the best position to accomplish his work expeditiou sly, and not only wastes an endless amount of time searching for them but frequently finds them in a disorderly or worthless condition.

These are only a few of the many illustrations of how "wasted energy can be eliminated. examples of which could easily be multiplied but which it is hoped, will serve to emphasize the importance of economic considerations in all phases of farming operations.

MORE CROPS WITH LESS LABOR

Canadian Farmers are confronted with the most difficult problem which they have ever been called upon to meet—the necessity of increasing food production with an ever decreasing supply of farm labor. To solve this problem, have proposed a number of plans, some of the most important of which are as follows:—

1. Greater co-operation among farmers in every farming community in regard to exchange of farm labor and farm power and greater co-operation of farmers with other interested agencies and with the Government in utilizing the information and other assistance which such agencies are gladly offering to give.

2. The use of labor-saving and larger farm machines for tilling the soil and harvesting and handling the crops which should likewise result in greater achievement with the same or less man-labor.

3. The use of all available farm manure, supplemented when necessary with proper commercial fertilizers, in order to increase the productive power of the land, and thus give larger yields and greater returns for the labor expended.

4. The planting of well-bred seed of adapted varieties of grain and the testing of the germination of seeds in order to insure better stands and larger yields.

5. A more careful organization of the farming business with reference to live stock raising, cropping plans, soil fertilization, the most economical use of available labor, machinery and power which the farm affords, and the securing of necessary working capital to purchase essential equipment and supplies.

6. Greater co-operation among farmers in each farming community in regard to exchange of farm labor and farm power, and greater co-operation of farmers with other interested agencies and with the government in utilizing the information and other assistance which such agencies are gladly offering to give.

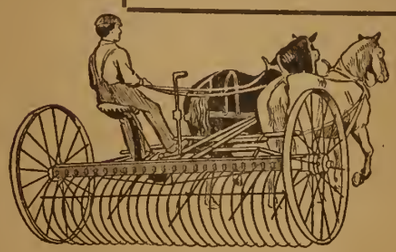
Get a Frost & Wood Mower

Over 80 years' experience with Canadian hay crops behind it—it won't fail you.

It's a rugged, durable implement—it does its work thoroughly—it will cut any crop you want to tackle. Its light draft is famous—due to its superior materials, the perfect alignment of cutter bar, our special internal gear drive and splendid roller bearings. Knives continue cutting when bar is raised to clear an obstruction, saving time and trouble. They cannot wear out cutter bar. Handy levers give immediate, easy control.

As soon as the Mower starts the knives begin to cut.

Give your hay making machinery special attention, now. If you need a mower, dump or side delivery rake, a tedder, a loader or a hay press, better speak to our nearest Agent about it right away. The Frost & Wood implements have a splendid reputation from ocean to ocean—and are the biggest value in Canada to-day.



Built for Hard Quick Work

Frost & Wood Rakes Give Perfect Satisfaction

Don't think all Rakes are just alike—they're not. Frost & Wood Rakes are superior in design, material and workmanship—that's their reputation in the field. Teeth are of special quality, tempered steel, 2 or 3 sections. Self-dumping by easy pressure on foot lever. Heavy angle steel frame guarantees rugged strength and years of steady service.

FOR SALE

Registered Jersey Bulls, one good bull 18 months old. One good calf 5 months old, sired by "Matinella's eminent," whose dam has qualified in the R. O. P. with a record of 10,777 lbs. milk and 530 lbs. fat. His dam has a record of over sixty pounds fat a month and has milked nearly sixty pounds a day.

J. R. SEMPLE & SON

Valley View Farm, - Truro, N.S.

GROW STRAWBERRIES

In the rush of other work, do not forget to set that new bed of strawberries this spring. Many growers are cutting down their acreage on account of labor difficulties and the high price of other crops. Production for the next few years will be cut in two and berry prices are sure to be high. Our advice to our fellow Fruit Growers is, grow all the grain you can, but DON'T GIVE UP THE STRAWBERRY. Among other varieties we recommend Senator Dunlap and Warfield at $4.00; Sample, Arnout, Buster and Glen Mary at $5.00; Wm. Belt, Dr. Burrell, and Bubach at $6.00 a thousand. The great everbearer, Progressive at $1.25 a hundred. Send a card for our free Catalogue.

CYRUS & MANNING ELLS, Port Williams, N. S.

LIVE STOCK SHOW FOR ALL CANADA NOW PROPOSED

An International Live Stock Show for Canada seems assured. The first step in the formation of an organization to get the show under way was taken at the rBeeders' meetings, held early in February, when each association elected delegates to confer together in connection with the matter. The second step was taken last Friday night when the delegates met at Toronto and appointed the following very representative committee to work out all details:

Heavy horses—Wm. Smith, Columbus; Peter Christie, Manchester; E. C. H. Tisdale, Beaverton.

Light horses—Geo. Pepper, Toronto; W. J. Cowan, Cannington; H. M. Robinson, Toronto.

Beef cattle—H. M. Pettitt, Freeman; Jas. Bowman, Guelph; L. O. Clifford, Oshawa.

Dairy cattle—John McKee, Norwich; B. H. Bull, Brampton; D. C. Flatt, Hamilton.

Dairy produce—G. G. Publow, Kingston; G. A. Putnam, Toronto; F. Herns, London.

Sheep—Col. R. McEwen, London; Jas. Douglas, Caledonia; J. M. Gardhouse, Weston.

Swine—J. D. Brien, Ridgetown; J. E. Brethour, Burford; H. A. Dolson, Norval.

Poultry—J. B. Saunders, London; W. W. Simpson, Guelph; G. G. Henderson, Hamilton.

Seeds—A. McKenna, Amherstburg; E. J. W. Lennon, Toronto; W. J. Squirrell, Guelph.

Secretary, Prof. G. E. Day, Guelph; Assistant Secretary, John Gardhouse, Weston.

W. A. Dryden, Brooklin, Ont., and W. W. Ballantyne, Stratford, Ont., were appointed chairman and vice-chairman respectively of the committee. Action in connection with the movement will be taken at once, plans of buildings prepared and method of handling the big show. When this has been done, the whole scheme will be submitted to Toronto, Guelph and Hamilton, the places putting up a fight for it, and after these negotiations the whole scheme will be submitted again to the original committee. While freely admitted that Guelph had done nobly in the matter of supporting the Winter Fair held there annually, yet the general feeling seemed to be that it had reached its limits, viewed from the standpoint of accommodation and that a new beginning with the old idea must be made if Canada is to stand in the very front rank as one of the greatest live stock countries in the world.

TEAM PLAY

The United States is just US—you and I and the folks next door and the people across the way—just US. All the government does is our doing. Its strength is our striving; its resources are our savings. What we do counts to make or break the power of the United States—and every minute, every act—to save or destroy US. In all we do, all we spend, all we eat—we must have care.

Food is our first and last resource, the dominant resource in this war. Our food supply is the final dependence of our allies; the food situation is the worst worry in Europe—worse now than when we began to figure. On our food supply hang their fighting power, their chance of avoiding famine, their hope of survival.

We have already shipped to Europe every grain of this year's surplus wheat. To keep them going, we must stretch our remaining supply—eat more corn and oats and potatoes. We must send them more meat; eat poultry and fish and beans.

That means team play—going without wheat one meal every day and Wednesday every week; it means going without meat one meal every day and Tuesday every week; no pork on Saturday; a weekly sugar limit of three-quarters of a pound apiece.

Team play—you and I and the folks next door and the people across the way—will do all that needs to be done. Let's help.—Maine Farmer.

Necessary Farm Equipment

MORE and more the Ford car is looked upon by progressive farmers as necessary farm equipment, the same as the plow, the hay-rake, the drill, the mower, the harrow and other labor and time-saving machinery.

A farmer with a Ford car can dispense with one or two of his horses and make the trips to town, railway station, creamery, or to the neighbours in one-third the time. In fact there is no farm machine made that will save the busy farmer and his busy wife so much valuable time as a Ford. And it's so easy to take care of—far easier than a horse. No bed to make, or hay and oats to get, no harnessing and unharnessing, and no stables to clean. The Ford practically takes care of itself.

Ask any farmer who owns a Ford if he would ever again try to get along without it. His answer will hasten your decision to own one.

B. T. FARM BOOK FREE TO FARMERS

The editor of the Maritime Farmer has recently received a copy of the revised edition of the B. T. Barn Book, edited and published by Messrs. Beatty Bros., Ltd., of Fergus, Ont. This book, which is profusely illustrated with splendid half-tones of farm buildings and stable equipment, contains three hundred and fifty-two pages and is well bound in a hard-board cover. A copy of this book will be sent to all readers of this paper who are interested in building or remodelling stables and barns, in the near future. As Messrs. Beatty Bros., point out in their introduction, the building or remodelling of a barn is one of the most important events in the lifetime of a farmer. It is a job which he cannot do over again, except at big cost, therefore it is well to do the job right. Before starting the work it is advisable to study the principles of barn construction, best methdos of framing, light, ventilation and layout of stables and to pay particular attention to the kind of equipment installed. The B. T. Barn Book deals with all phases of

barn construction and stable equipment in a most thorough manner, and the editor of this paper would strongly advise all readers of the Maritime Farmer who are arranging to build or remodel their stables this coming summer or contemplate doing so in the near future to send at once for a copy as it contains many practical ideas about the best methods of building remodelling and equipping which have been obtained by Messrs. Beatty Bros. from the leading agricultural authorities of Canada. To give some idea as to the valuable information it contains the following index will be interesting: Design. size, foundations, framing. erecting plank, frame barn. roor pitches. cheaper plank frame construction, doors, windows, ventilation. layout, columns, installing equipment, floors. creosote blocks. mangers, gutters. walls. cement work, measurement of stalls, silos and feed room, temperature, ceilings, free barn plan service, right and wrong methods of remodelling, model barns and plans. which. coupled up with the numerouos illus trations, will be found of great interest and real vaule to all farmers.

SOAP FROM A TREE

It is suggested by a writer in "American Forestry," that the soap nut tree should be more cultivated on this con tinent.

Several important uses are attributed to the product of this remarkable tree. The hull of the nut supplies raw material for the manufacture of soap and other articles which require an ingredient with saponaceous proper ties. This material may even be used as soap without compounding. By shreddiug the hull and using it with water as if it were soap a perfect lather is readily obtained. and some authorities state, that the cleansing qualities are superior to manufactured soaps. The extract's efficiency as a foam-producer makes it useful as an ingredient in carbonated beverages. The kernel yields a fixed oil, which some say for culinary purposes is equal to olive oil. Some thereapeutic value is also attributed to the nuts.

The wood of the tree is close-grained, takes a good polish, and is said to be well adapted for furniture making. The tree grows to a height of fifty feet.

BAD YEAR AHEAD IN FOREST FIRES

The danger season for forest fires is near at hand. Rapidly drying soh has left the old grass, brush. leaves, etc., in a most perilous condition for starting fires.

An effort is being made by the fire rangers in these provinces to keep dow n the forest loses this year to a minimum. They will succeed only if every camper carefully extinguishes his camp fire be fore leaving it, if every smoker refrains from tossing away burnt matches or tobacco in or near a wood. and if settlers in the newly opened districts guard their land-clearing fires with the utmost care. Settlers' fires continue to be the very worst source of forest conflagration. although campers and careless smokers are close competitors.

"The fire rangers," says the Canadian Forestry Association, "want every good citizen to regard himself as a deputy ranger from now until November first.

" ACanadian forest was never worth so much as today, never gave so many jobs as today, never put money into circulation as it does this year."

WHAT THE PLOUGH IS SUPPOSED TO DO

Aside from crumbling the soil, the chief objects of ploughing are to destroy wild plants so that cultivated ones may take their place; and to bury trash, manure, stubble and potato vines. A plough that does not accom plish these things is faulty. All refuse should be completely covered so that it will not be brought to the surface by the harrow. To bury weeds, clover or other tall green manure crops, a chain should be used. one end attached to the plough beam, the other to the double tree. thus allowing the loop to pull the tall plants down into the furrow to be covered. The jointer or skim-coulter is little used in many districts. Many farmers do not know even what it is. When manure, stubble, or grass is to be turned under, it is a very useful attachment. It skims a shallow furrow slice and deposits it in the bottom of the furrow, where it is covered by the main furrow slice and will rot more readily. When stubble or grass is ploughed without a jointer ,there is likely to be a line of it between the furrows, which interferes with the harrow or begins to grow and cause trouble. This is a common sight, but could. and should be overcome by the use of the jointer. The implement dealers of the country could perofrm a distinct service to agriculture by the general use of jointers on ploughs. There should be one on every farm.

It is well to have various types of ploughs for the various kinds of land to be ploughed. This costs more, but greatetr efficiency results. A sod plough will not do good work in soft stubble lands, nor will a stubble plough perform well in stiff sod.—From "Handbook for Farmers," published by the Commission of Conservation.

LITTLE THINGS TO HELP THE HORSE

There are many things to watch in order that a horse may work without galling. These are the most important. The collar should not be longer than enough to avoid touching his wind. It should fit as snugly as possible without pinching and should fit as well at the top as at the bottom. The hames should be adjusted so that the draft will be at such an angle that the collar will not work up and down. The hames should always be tight. More harm than enough is done by working horses with loose hames. It is a good idea to stop at odd times and buckle the hames up properly.

The best experience seems to prove that a sweating horse is less likely to take harm from a cloth faced collar. Sweat pads should be avoided wherever possible, and if they must be used the collars should be tighter than when used without the pad. Carefui watching by the teamster is the important thing. During hot days the horse's shoulders should be carefully watched and collars lifted occasionally. A breathing spell of two minutes to the horses with their collars held up half a minute will do much to cool their shoulders and keep them in bet ter condition. Manes should be kept out from under the collars. Collars should also be well cleaned each night. There is nothing more conductive to sore shoulders than a dirty sweaty collar, and on a hot day a few hours work puts the collar in that condition.

IMPERIAL SERVICE

If you are in doubt about the proper lubricant, *ask the Imperial Oil man.* He will give you courteous attention and sound advice on your lubrication problems. That is part of Imperial Service.

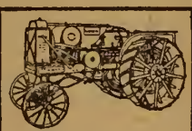
LOOK TO US FOR LUBRICATION ADVICE

TRACTORS, automobiles, stationary engines, threshing machines and binders, present different problems in lubrication. When you burn kerosene in place of gasoline, you change your lubricating requirements. Tight and loose bearings—cylinders and axles—require different lubricants. There is no one best lubricant for all purposes.

But there is a scientifically correct and extremely efficient lubricant for each type of engine and fuel. There is an oil for every lubricating condition. At Imperial Oil stations in all parts of Canada, you can find the oil that will make you forget lubrication troubles and give you the full power and usefulness of your machine.

Each Imperial lubricating oil is sold in steel barrels and steel half-barrels—most convenient and economical. There's no waste. You use every drop you pay for. And it's uniform and clean.

A Correct Lubricant for every Farm Machine



For Gasoline Engines, Tractor, Auto or Stationary
POLARINE OIL
STANDARD GAS ENGINE OIL
For Kerosene Engines, Tractor or Stationary

MONTREAL

Dairy Produce Trade

The receipts of butter today were 228 packages, as against 96 for the same day last week, and 378 for the corresponding date a year ago. The tone of the market remains firm under a steady demand for all supplies coming forward to meet immediate wants, and a fair trade was done in a wholesale way in finest creamery at 52c to 52½c per lb. It was reported today that several cars of creamery butter were on the way from the northwest. Arrivals of oleomargarine from the United States were more liberal today, and quite an active trade was done in a wholesale jobbing way at 32c to 34c per lb, as to quality.

We quote prices as follows:

Finest Creamery.....52c to 52½c
Fine Creamery .....51c to 51½c
Finest Dairy.....45c to 46c
Fine Dairy.....43c to 44c

The receipts of cheese today were 124 boxes, as compared with 196 for the same day last week, and 1,834 for the corresponding date a year ago. There was a good demand for small cheese today for domestic consumption, and sales of some fair-sized lots of 20-lb. cheese and twins were made at 23¾c per lb. and early made 2-lb cheese at 32c.

The Allied buying commission in New York are buying Northern New York State fodder cheese at 22c per lb. alongside steamer at New York.

The United States Government Bureau statistics show stocks of creamery butter to have increased 108.3 per cent. over April 1st, 1917, and the stocks of cheese showed an increase on April 1st, 1918, of 225.6 per cent. as compared with the same date a year ago.

The Commission is paying the following prices:

No. 1 Cheese.....21¾c
No. 2 Cheese.....21¼c
No. 3 Cheese.....20¾c

The Price of Cheese

With regard to the price of cheese, I am sorry to say that we, at least in our vicinity, are anything but satisfied with what we are getting for our milk. We are nearly compelled to send our milk to a pooling factory where it took 11.57 pounds of milk in August, to make one pound of cheese, and 10.91 pounds in October, for which we received $1.64 in August, and $1.77 in October per 100 pounds of milk.

We should have at least 25 cents per pound for cheese, with $1.75 off

for making, which would leave us about $2.20 per 100 pounds of milk, which is not near the price they are paying at the condenseries, or in the city. However, $2.20 per 100 pounds of milk would give us just margin enough to stay in the business and do our best to help to swell the cheese, which is so conveniently used in the trenches by our soldiers.—Level Lea Stock Farm.

Millfeed and Rolled Oats

In this department of the trade there was no new features to note. Supplies of millfeed continue small , and in consequence business is quiet and prices are unchanged with bran quoted at $35.40, and shorts at $40.40 per ton including bags. The trade in pure grain mouillie is fairly active owing to the good demand and prices rule firm at $75 per ton including bags. There was no improvement in the domestic demand for rolled oats, and the market was quiet. Standard grades in broken lots quoted at $5.50 to $6.50 per bag of 90 lbs. in jute, and car lots at $5.40 per bag of 90 lbs. in cotton. A fair business continues to be done in cornmeal in a wholesale jobbing way and prices are firmly maintained with sales of Golden grades at $6.25 to $6.40 and bolted at $4.50 to $4.75 per bag delivered.

Country Produce

market for eggs teday, and prices were unchanged. The recepits were large, but as the demand continues very good for domestic consumption and for storage account they had no influence on the situation, and an active business was done in a wholesale jobbing way in fresh-gathered stock at 42c per dozen. The receipts today were 3,097 cases as against 1,440 for the same day last week, and 1,965 for the corresponding date a year ago.

The market for maple product was without any new feature to note, prices being firm, with a continued good demand for supplies, and an active trade was done in a wholesale jobbing way, with sales of five gallon tins at $2.10 per gallon, one gallon tins at $2.15, and 8½ tins at $1.50. The demand for maple sugar is also good, and all supplies coming forward are meeting with a ready sale at 20c to21c per lb.

There was no change in the condition of the market for honey, prices being maintained, with a small trade passing in a wholesale jobbing way, and sales of No. 1 white clover honey in comb were made at 21c to 22c per section, No. 2 white at 19c to 20c, No. 1 brown in comb at 18c to 19c, No. 2 brown at 17c, and white extracted at 18c to 20c per lb. in 30-lb tins.

The tone of the market for potatoes remains steady under a fairly good demand for small lots to meet actual wants, and a good trade was done in a wholesale jobbing way, with sales of Green Mountains at $1.55 to $1.60 per bag of 80 lbs, ex-store, and car lots on spot were quoted at $1.50 per bag of 90 lbs. ex-track.

THE MANUFACTURE OF CREAM CHEESE

(Experimental Farms Note)

At some time or other during their carrer, most dairy farmers have experienced difficulty in marketing their produce satisfactorily. The trouble may have beenbe cause of a poor demand for their product, or the quality may have been below standard.

The dairy produce from the Experimental Farm, Agassiz, B. C., has been sold in a number of different ways, one of the most satisfactory of which is in the form of cream cheese. The cream cheese appears to be the most popular soft cheese. It is easlly made on the farm and requires very little special apparatus. The labor and cost of making and packing are small, so that the manufacture is well suited for any producer within a reasonable distance from a market. It is a suitable and remunerative method of marketing cream. During cool weather we have been able to keep this cheese for a week or ten days without any appreciable deterioration in flavor, but, as evaporation is going on continually, the cheese, unless originally made overweight will not be up to the standard weight at the end of this time. It is therefore advisable to place it on the market as soon as possible after completion.

The market as yet is limited but the demand appears to be increasing. We have sold during the past twelve months 5,420 of these cheeses in the city of Vancouver. The wholesale price obtained is 15c. each, which amounts to $813.00 for the product during the past year. Each cheese weighs six ounces and approximately ten dozen are now being manufactured weekly from 170 pounds of twelve per cent. cream. This brings a return of ninety cents per pound butterfat for the cream, with the whey retained for feeding purposes.

The shape of the cheese is cylindrical from one ot one and a half inches deep and three inches in diameter. When moulding, the cheese is pressed into a cheesecloth cover and when ready for shipment is incased in a neat cardboard carton. It is a cheap cheese and a convenient size for table use. Picnicers have found it a suitable substitute for meat as a filling for sandwiches. It is also found to be very delicious and palatable when served with lettuce, celery or any of the various kinds of vegetable salad.

The method of manufacture is concisely described in Exhibition Circular No. 23, which may be obtained for the asking from any of the Experimental Farms.

FOR mops, brooms and brushes "as good as new", try dissolving a heaping tablespoonful of Gold Dust in a pail of hot water. Thorough "swishing" makes them clean and sanitary, because Gold Dust so quickly dissolves the grease.

HOW THE FARMER BUILDS

He examines carefully—he figures closely—and he puts up a substantial house and barn, at a big saving of time and money—by using Bishopric products.

BISHOPRIC STUCCO BOARD

is made of sulphide Fibre Board with bevelled undercut lath embedded in the molten asphalt mastic under great pressure. It comes in panels 4' by 4', but if longer lengths are required, same will be run on request. Ready to be nailed direct to the studding, lath side out, as a foundation for stucco outside the building or plaster inside.

For interior walls and ceilings not to be plastered,

is applied direct, lath side to the studding, leaving the fibre board exposed, giving an excellent sized decorative surface for any class of interior decoration.

Bishopric Stucco Board makes warmer, drier and better buildings and reduces cost over lath and plaster. A carpenter can apply it quickly and without muss or dirt, or you can do the work yourself.

HEMORRHAGIC SEPTICEMIA OF CATTLE

Hemorrhagic septicemia of cattle is a contagious disease and is due to an oval-shaped micro-organism known as the Bacillus Bovi Septicus.

The disease was first pronounced in Germany in 1879, and is therefore, comparatively speaking, quite new. It was first seen in America in the year 1898, when it made its appearance in Tenessee.

The first outbreak discovered in Canada was in 1902, at a place called Bury, near Sherbrooke, in the province of Quebec. In September 1902, this department requested me to investigate a disease in cattle at Bury that was thought to be anthrax. After a careful investigation I was satisfied that th edisease was not anthrax. Instead, I found symptoms and post mortem lesions similar to those described in the text books as hemorrhagic septicemia. As the disease was then unknown in this country I did not wish to pronounce positively without further investigation.

One year later, in September 1903, I again visited the Sherbrooke district, and, in company with Dr. A. W. Tracy, the local veterinarian, visited an infected farm where we found some very typical cases and positive post mortem lesions. I then had no hesitation in pronouncing the disease hemorrhagic septicemia. From year to year since, this disease has been frequently seen in different parts of Quebec. Some years later it apeared in the northeastern counties of Ontario, then in other provinces, until at the present time hemorrhagic septicemia has been reported in nearly all the provinces of the Dominion. I am convinced that the disease existed in the Eastern Townships of Quebec prior to 1902, and was then confused with anothrax and black quarter.

There have never been any very serious outbreaks in this country; usually from one to three or four cattle have died on the same farm. Occasionally a more severe form is seen, when eight or ten cattle die on the same premises. Fortunately the disease usually disappears in a short time and the same farmer may never have any more losses. It is very possible that the cattle which are exposed acquire a natural immunity, which is nature's way of vaccination, and may protect the animal for the rest of its life. The mortality in cattle which suffer from this disease is very high, ranging from 80 to 90 per cent. or more.

There are certain localities where the disease is most prevalent. These localities, low-lying, swampy lands, are favorable to th existence and perpetuation of the virus.

Infection is introduced into the body principally by the digestive tract, sometimes, however, through a wound on the surface of the skin, or on the membranes (mucous) lining the organs inside the body.

Resemblance to other Diseases

The symptoms of hemorrhagic septicemia vary in accordance with (1) anthrax, (2) black quarter, (3) cerebro spinal meningitis and (4) milk fever.

The sudden death of the animal with passage of blood from the natural openings leads one to suspect anthrax.

The swellings sometimes found on the neck, throat, legs and sides in young animals somewhat resemble black quarter.

The nervous symptoms, as delirium twitching of the muscles, and loss of control of the body, are often mistaken for cebero spinal meningitits.

Other cases present symptoms almost identical with milk fever.

In some forms of the diease therefore, it is difficult for even an experienced veterinarian to arrive at a correct diagnosis during the life of the animal. Post mortem lesions however, are very characteristic in hemorrhagic septicemia, and can be easily distinguished from the above diseases.

Symptoms

First, the animal is rather dull,

The "Guardian" of Your Cream Profits

It is not a bell; nor a speedometer; nor muscle—it's the *suction-feed principle* of the Sharples Separator. Other separators do not have this basic advantage—that is why all sorts of make-shifts are adopted. These merely *remind* you that cream is being wasted—they don't *remedy* it. To get maximum cream profits you must *skim clean at any speed*—and there's *only one way* to do it—use a

SHARPLES SUCTION-FEED CREAM SEPARATOR

Tests *prove* conclusively that 95% of all separators are turned under speed. As applied to the Sharples it does not matter—at 35 revolutions or at 55 revolutions *clean skimming is certain.* With any other separator (*no exceptions*) there is a constant waste of cream when turning under speed. This cream waste averages about 10 lbs. per cow per year, or the staggering total nationally of over 80,000,000 lbs.

Another big Sharples feature is the one piece bowl, *no discs to clean.* You get done quicker and feel in a better humor. Write for catalog. Address nearest office, Dept. 79

Handy Scales for Farm Use

Convenience and service are the chief features of the

Fairbanks Farm Scales

The handle at the base of the weighing post permits of ready transportation on its own wheels to any part of the farm buildings. In house or barn or dairy it serves any purpose up to 2000 pounds capacity.

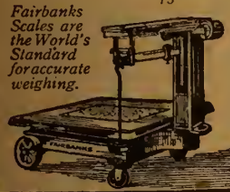
Fairbanks Portable Farm Scales are compact and absolutely accurate. The platform is 34 x 25½ inches and has a clearance of 11 3-8 inches above the ground.

Write our nearest branch for full details of this and other types of scales.

The Canadian Fairbanks-Morse Co., Limited 75

St. John Quebec Montreal Ottawa Toronto Hamilton Windsor Winnipeg Calgary Saskatoon Vancouver Victoria

Fairbanks Scales are the World's Standard for accurate weighing.



standing with arched back; the tem perature is extremely high, form 104 deg. Far. to 108 deg. Fah., and may suddenly drop to normal. In other cases I have seen a very high temperature just before death, the temperature prior to this being quite normal. Breathing is labored, pulse quick and very weak, and becomes almost imperceptible as the disease progresses.

The manure is very black (tarry) and semi-liquid, and is accompanied by large quantities of clotted blood, and the animal may practically bleed to death by the intestines. This symptom is almost always present, but much more marked in some cases than others.

The animal will sometimes become delirious, push its head into the manger, stagger around or turn round in circles, finally going down and will lie in a stupified condition with the head around towards the flanks as in milk fever; death follows this stage in a few hours.

In other cases there are swellings on different parts of the body, especially in the neck region and the sides. These swellings are flabby and not sensitive. Blood may ooze from the nose and through the skin.

There is a very rapid emaciation. A fat animal will become a mere shadow in only a short time. Death usually takes place in from two to ten days; recovery very seldom.

Post Mortem Appearance

Often-times the first thing noticed on opening an animal is the pale, bloodless appearance of the muscles.

The portions usually affected in hemorrhagic septicemia are the outer (serous) coats of all the internal organs, especially the heart, lungs, stomach, intestines, brain and spinal cord; also the inner or mucous coats of the somach and intestines. The lesions found resemble blood splashes varying in size from a pin prick to large areas, often giving the organ a black, bruised appearance. These areas (hemorrhagic areas) are usually surrounded by a straw colored jelly like substance (lymph). On skinning the animal these areas are often found immediately under the skin, and resemble bruises.

Treatment

At the present time there is no known cure for hemorrhagic septicemia. A great many drugs have been tried, but nthing has proved satisfactorw. Vaccination and serum treatment have proved successful in some cases, but are yet only in the experimental stage.—By E. A. Moore, Chief Travelling Inspector, Health of Animals Branch.

A SEED SELECTION SYSTEM FOR PRACTICAL FARMERS

..If the purity and yield of our farm crops are to be maintained at a high standard it is essential that selection be applied regularly from season to season by the grower. The method does not matter so much as long as it eliminaees the weak, multiplies the vigorous, and removes all foreign varieties. The following is an outline of a recommended system of selection in which there are two essential factors the **seed plot** and the **multiplying field.** This method is simple and efficient and when followed correctly will ensure the maximum of purity and productiveness.

The special seed plot is the nursery of the grain field and sould be large enough to produce sufficient seed, (after the rejected plants and light light grain has been removed) to sow the multiplying field the following season. This field should also be of sufficient size that enough seed will be produced to sow the whole acreage of that particular crop the next year. She size o fthese plots will vary, depending entirely on the productivity of the soil, climatic conditions and the amount needed for seed. For instance, sowing oats at the rate of two and one half bushels the acre, for twenty acres a multiplying block one and a quarter acres in size would produce sufficient seed, if the soil were reasonably productive, while one tenth of an acre would be large enough for the special seed plot.

In the operation of this work the following points should be emphasized.

1. Secure pure foundation stock. **A few pounds of "pedigreed" seed is better than several bushels of an unknown variety.** If you do not know where this can be procured, write to the Dominion Cerealist, Experimental Farm, Ottawa.
2. Establish a seed plot the first season whether you have secured five pounds or twenty-five bushels of "ped igreed seed."
3. Place this plot on the best part of your grain field.
4. Close off every eighth drill and leave a narrow path around the plot so that you may go through and around it without tramping down the plants.
5. "Rogue" carefully, removing ali plants showing abnormal height, variation in shape of head, color of chaft, etc. If thoroughly rogued three times during the season it will be sufficient, although the best plan is to devote to it a few minutes every day or so.
6. Harvest carefully, and thresh separately, preferably with a flail the first season.
7. Fan thoroughly and hand pick the grain from the seed plot the first season. This can be done in the winter time and will remove any foreign varieties that may have got in during the threshing. One person can easily hand-pick a busher a day. With careful threshing after the first season this hand picking can be avoided **except the seed for the seed plot, which should be hand picked every year.**
8. Sow with this hand picked seed the second year, first a seed plot, then sow the remainedr in a multiplying field. The latter should, of course, receive casual inspection, although it proper care has been taken, systematic rogueing should not be necessary.
9. Examine and harvest the seed plot with the same care as the previous year.
10. Clean the threshing mill thoroughly, first thresh the multipyling plot, then the seed plot.
11. Fan thoroughly the grain from the multiplying plot and use this the next season for seeding your total acreage. This means that in the third year after the system is established, you have three distinct lots of grain, the special seed plot, the multiplying seed plot and the main field.
12. When growing nothing else but "pedigreed seed" and without a threshing mill of your own, thresh these three lots in this order, first the main crop, next the multiplying field, and last the special seed plot. nI this way the chances of mixing are reduced to the minimum.

This system is practical and profitable, guaranteeing pure seed and high yields. STUDY IT CAREFULLY, THEN TRY IT.

SPREADERS OF DISEASE GERMS ON EVERY FARM

Disease germs are easily spread and, as a rule, few precautionary measures are taken to guard against their dissemination. Were it not for this feature, there would be a far greater likelihood of farmers meeting with success in their endeavors to get rid of any infectious disease in connection with their herds and flocks than there is at present, when comparatively little effort is made in that direction.

There are various ways in which disease germs may be carried. One of the most common is in the water supply. Unguarded wells are a prolific source, especially where there is seepage into it from a manure pile, or where the top of a dug well is not properly guarded, and vermin of various kinds find it a death-trap, and their dead bodies are left to decompose and pollute the spring. Outlying and stagnant pools are another source of germ life where myriads of these invisible things live their short lives and die, all the time a menace to higher forms of life that come in contact with them. Other forms of germs simply await their opportunity, enter the bodies of thirsty animals when drinking, get into the blood, or attach themselves to some vital organ, set up inflammation, reproduce their species, and thus cause disease and death. Any body of water may become infected with disease germs. Passing through various layers of earth, however, it becomes purified, hence water from deep wells that are properly protected is comparatively safe for either stock or human consumption.

Food is another common carrier of germ life. Contagion is effected in various ways. One of these is in the purchase of feeding material from market supplies, such as mill feeds that have been handled in a careless manner, mill sweepings, etc. Almost everywhere one goes he is constantly coming in contact with these forms of germ life, and while not all are dangerous to life many of them are, and while in the main commercial foodstuffs are fairly clean, many are not. Home grown feeds should be free from disease germs, and will be so if through careful methods in handling they are not allowed to become contaminated.

Another source of infection is by animal contact. Germs on various parts of the body of one beast may be transferred to another by brushing up against it or breathing in other animals' faces, coughing, scattering germs on litter, carrying them about yards, scattering them over fields, rubbing up against posts or fences, and in various other ways depositing them where other animals doing the same stunts will come in contact with them. This is particularly dangerous when newly purchased animals are first brought to a farm. Such stock should be quarantined for a month or so in order to give any disease a chance to develop, so that one could recognize it.

One of the worst spreaders of disease is the slavering habits of some animals, and which in others takes the form of phlegm or sputa, and is ejected by the mouth and by coughing or spitting, thus becoming incorporated with dust, animal food, mangers, watering troughs, water, fences, posts, pasture, and a hundred over things with which they come in contact. Healthy animals following such individuals are sure to take into their systems many of these germs.

Still another source is that of inflamed surfaces throwing off scales containing germs which get into water and food, or are directly carried to the bodies of other animals by various utensils such as brushes, combs, brooms, cloths, etc. Skin diseases are very commonly carried about in this way, as are also bodily sores from which pus is being discharged. In this connection it may be said that such diseases as cow pox, that attacks the udders of milch cows, are very frequently carried from one to another by the hands of milkers.

Accidents, such as cuts, wounds, or indeed any kind of sore may be a means of inoculation if they are brought into contact with other sores containing germs of a serious nature.

Another source of infection, and one that is little suspected, is that of disease germs being carried into the stable of a herd on the clothes of attendants, and visitors' shoes. Parties in attendance upon animals affected with any contagious disease should in no case visit other stables on the same farm, or the stables of neighbors' farms, or indeed any other buildings, without first changing clothing and shoes, and carefully washing hands and other exposed parts of the person, for in no case can they be sure that they are not carrying about these germs unless this precaution is taken.

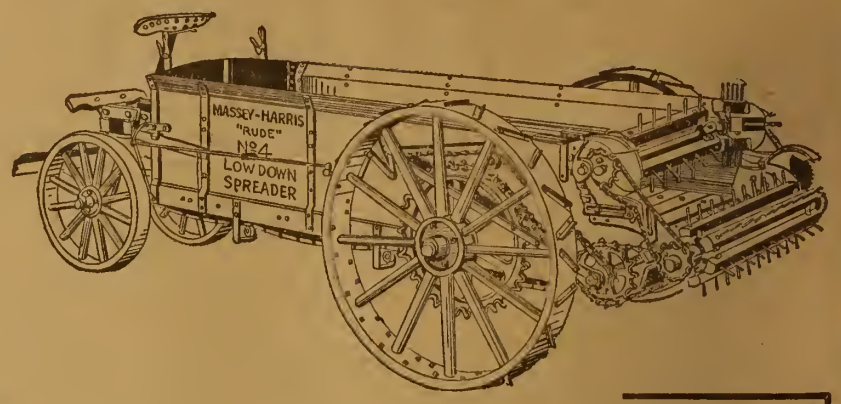
All sick animals should be removed from the balance of the herd and so isolated that there will be no possibility of any contact, for almost as certainly as this is not done, and the disease is contagious, it will spread through the whole herd and cause endelss loss both in time, expense of medical attendance, and in many cases the animals themselves.

The seriousness of contracting infectious diseases in the herds and flocks of our land is not recognized to nearly the extent that it should be, and until stockmen wake up to the gravity of the situation, and the real menace that some of these diseases are, not only to the live-stock of our country, but to that of human lives also, there will be little progress made along the line of extermination.

There seems to be real need of education and legislation along this line at the present time, so that the many dangers from this source will be greatly rduced in the near future, if not entirely overcome.

MASSEY-HARRIS SPREADER

Low Down Wide Spread



Here is a Spreader that is low-down, but not too low—plenty of clearance under the Frame.

It is a Wide-Spread Machine—spreading full seven feet wide, although the Box measures only 3½ feet.

Ample strength is secured by making the Frame of Steel—heavy 4-inch Channel Side Sills with Steel Cross Sills, forming the strongest Frame ever put on a Spreader.

The Simple Chain Drive does away with all Cogs, Clutches, and Springs, and when out of gear no parts of the machine are running to cause wear.

The Upper Beater is in two sections, set at an angle to spread the load out beyond the Wheels.

The Simple, Direct Drive—the Divided Beater and small size of same—the taper shape of the Bed—the Broad-Faced Wheels—the careful fitting of all parts—these combine to secure light draft.

For Illustrated Booklet, ask the Local Agent, or write nearest Branch stating where you saw this ad.

FARM HELP AVAILABLE

25000 Older Canadian Boys Have Volunteered

TO HELP THE FARMERS

Last year 7,000 Older Boys demonstrated to the farmers of Canada that they could help take the place of the regular farm help that has gone overseas.

They proved their willingness and ability to adapt themselves to farm work.

This year many farmers are asking for boys.

Already 25,000 boys between 15 and 19 years of age in Ontario and western Canada have offered their services as SOLDIERS OF THE SOIL. The enrollment week for New Brunswick takes place April 28th to May 4th. The plan is to have the boys fill in the enrollment forms which will be turned over to the Department of Agriculture.

The farmers are asked to write to the Minister of Agriculture stating what help they require and for what period.

Arrangements as to wages will be agreed upon by the farmer and the boy.

J. F. TWEEDDALE,
Minister for Agriculture.

GIANT HORSE-TAIL

"What is one animal's meat is another animal's poison," is well illustrated by the horse-tail weeds, common everywhere in Canada, growing in all places where moisture is abundant and known by several common names.

The horse-tail weed is familiar to most people, but many do not know that the different forms under which it appears are from one and the same plant.

The first stems to appear in the spring are thick, pale and unbranched, have loosely-fitting toothed sheaths at intervals, and cone-like tips which are the fruiting organs containing the spores. The horse-tail is like the fern in this respect for it has no flowers and therefore no seed. A little later other stems are sent up from the same creeping root-stock. These are bushy with slender whorled branches, are green throughout and are merely vegetative. The jointed stems serve to distinguish horse-tail from the true grasses, sedges and rushes amongst which it grows.

One common name given to the horse-tail is "scouring rush." The stem contains a large quantity of silicon or flint and this name has been given, for floors and furniture are in some places cleaned with this plant. Another common name and one of much more importance to farmers is "stagger weed."

It is not generally known that this weed, both green and when dried into hay, is poisonous—one kind to horses, and another to cattle. As a rule, it is the young and the inexperienced animals that fall victims to poisoning by plants. Long years of costly experience have taught wild animals what to carefully avoid as dangerous. What to select in case of illness and what to seek for food.

Domestic animals introduced by man into new countries have to learn fresh lessons and it is their owner's duty to become acquainted with the nature and properties of all plants found in the neighborhood.

The Field Horsetail (Equisetum arvense) is seriously poisonous to horses but does not seem to affect cattle. The symptoms of horsetail poisoning are unthriftiness followed in two or three weeks by loss of control of muscles, swaying and staggering about and finally falling down as the muscular contractions increase in violence. Change of food is generally followed by a rapid recovery. Situations which contain a large percentage of this week should never be used for cutting hay.

While sheep and pigs are not affected by horse-tail, there is one kind (Equisetum palustre) which is fatal to cattle, and similar symptoms occur as in the case of poisoning of horses.

AGE AT WHICH HENS SHOULD BE CULLED

The practice of selling year old hens and renewing the farm flock with pullets is responsible, in a large measure, for the uneven supply of eggs during the year. The year old hen will continue to lay through the molting period and well up into the winter before taking a rest. This means a fair average production at a time when eggs are scarce and bringing good prices. By keeping over the best of the year old hens and an equal number of early hatched pullets, one will secure more uniform egg production during the year, and have better breeding stock than is the case when only pullets are kept in the flock.

By culling the year old flock during the summer or early in the fall, one can make careful selection of the birds to keep over and improve the flock along more intelligent lines than when only pullets are selected. Possibly the rule of disposing of year old hens and getting better results from pullets may hold good with breeds of Plymouth Rocks, Wyandottes and other easily fattened fowls, but with Leghorns, Minorcas and other small egg-producing breeds one should go slow in discarding year old hens that are healthy and have demonstrated their ability to produce.

The cost of hatching and developing a sufficient number of young pullets to renew the entire flock must also be considered although many farmers claim that the extra cockerels raised and sold will pay for the raising of an equal number of pullets. This may be true on farms where the facilities are adequate for hatching and developing large numbers of fowls form which to make selections for the laying flock, but on the average farm it is a puzzling problem to raise enough good pullets to renew the entire flock of layers each year. Late hatched pullets are undesirable for layers, bsides late hatched chicks are more susceptible to diseases and ailments during the hot weather.

Considered from the standpoint of uniform production during the year, as well as from the standpoint of improvement through breeding and selection, the best plan for the renewal of the flock is to keep over year old hens and pullets in about equal numbers. This provides for the renewal of one-half of the flock each year, and makes it possible to dispose of the older birds during the summer and early fall, when prices are favorable. If keut until along in the fall the market is well supplied with fowls and the prices are generally lower. It also makes room for the pullets as soon as they are sufficiently developed to go into the laying quarters. In this way the year old hens will bridge over the season by laying until the pullets begin to produce in the fall and early winter.—W. M. K.

NEPONSET ROOFS

NEPONSET PAROID ROOFING NEPONSET TWIN SHINGLES

RED or GREEN as well as GREY

MANY people do not even yet know that, in addition to the standard GREY finish, the famous Paroid is also made with a crushed slate surface; permanent Red or Green colors. Imagine what handsome effects are possible with these colors.

NEPONSET Paroid ROOFING

Of course the main points about Paroid are its long life, its weather and fire resistance, the fact that it is so easy to lay and so economical to use. Ask your lumber or hardware dealer.

Look for the roll with the Paroid label—there is only one genuine Paroid.

The Great Neglect in Sheep Husbandry

Failure to Castrate Ram Lambs Intended for Slaughter

ADVANTAGES OF DOCKING

One prominent writer on agricultural topics has characterized the failure to castrate male lambs as "the great neglect" in sheep husbandry. There is no doubt that this negligence has been a decided drawback to the progress of the sheep industry in Canada. Farmers who are engaged in raising horses do not for one moment contemplate leaving all male offspring entire. Nor do cattlemen forget to castrate bull calves, unless they are intended for breeding purposes. Hog raisers have realized that it is necessary to unsex their grade boars and some even deprive the females of their ovaries, in order to insure the best gains in weight. There is no justifiable reason why sheep raisers should be so careless in this regard. Nevertheless, cold facts demonstrate that, unfortunately, emasculation of grade rams is not practised to the extent it should be. Why castration should be neglected in this class of live stock is difficult to understand. Probably the greater docility of the ram compared with the bull or stallion may afford an explanation. The ram will not break down fences as will the stallion, nor gore attendants to death as the bull. Dire calamaties always impress people. It should not be necessary, however, for deaths to occur before warnings are heeded. Fortunately for mankind, rams are not so ferocious as bulls. If they were, imagine the continual danger which would be the result of the number of entire rams which are to be found in every district where sheep are raised.

Docking is also neglected to fully as great a degree as castration. Both sexes should be docked. The main argument against the docking of horses is that the natural means of fly protection is destroyed. In the case of sheep, this argument cannot be riased, because the tail is so heavy as to prevent switching and, moreover, the heavy covering of wool, which the flies cannot penetrate, makes it unnecessary. On the other hand, the presence of a tail induces the collection of manure, in which maggots may develop.

Reasons for Castration

1. Unsexed lambs are more easily cared for than rams in the field, since they are not so restless and, consequently, do not require as strong fences.

2. Wethers grow and fatten more quickly than rams. Lambs for the fall market are disposed of shortly after weaning and should be in good condition at that time. Where emasculation has been neglected they may, however, not be fit for the shambles. At about three or four months old the lamb realizes his masculinity and proceeds to worry the females in his company and, when separated from them, the males will jump upon one another, paying very little attention to feeding. These lambs should be fattening, but reality shows that the reverse is the case and what is known as the baby fat is lost. A check in growth takes place and it is impossible to hasten the fattening process or obtain the desired state of bloom, unless heavy grain feeding is practised. This means a financial loss either owing to the greater amount of grain which must be fed or to the reduction in price which results from an unfinished condition. Experiment has shown that wethers make 11 per cent more gains in weight under similar conditions than do ram lambs. The negligent sheep raiser does, therefore, pay a severe penalty.

3. Drovers will not pay as much for ram lambs as for wethers. Some markets will accept rams only at a reduced price The reduction made in this respect by the Live Stock Exchange of Toronto is seventy-five cents per head upon all males not castrated.

4. Unsterilized lambs may get into the ewe flock. Sometimes mating takes place, which may be undesirable and productive of heavy financial losses.

5. Castration of males intended for the butcher is a very apparent sign of good shepherding and lambs from a well-managed flock find a ready market, even in times of a temporary market depression.

6. Winter feeding for mutton purposes can be undertaken more successfully with wethers than with rams.

Methods of Castration

Liability to injury or death is the lame excuse which some men put forward when asked why they do not sterilize their male lambs. There is very little risk, however, if the operation is performed at the proper time and attention is paid to the maintenance of sanitary conditions. Castration can best be performed when the lamb is about ten days or two weeks old. At this time a minimum amount of pain is caused. Aged rams, even five or six years old, may be deprived of their testicles with safety, if the operation is performed in a careful manner. An effective disinfectant should be used in all cases. The hands and knife should be sterilized and a little antiseptic placed on the wound, thereby preventing the possibility of infection. Clean pens with repeated renewals of fresh straw are required. If castration takes place when blow-flies are abundant, precautions should be taken to prevent their interference with the wound. This may be done with disinfectant or a little covering of tar. Many shepherds always smear the opening of the scrotum with an ointment of lard and turpentine mixed to the consistency of a soft paste. Any method which will prohibit the ravages of the fly and hasten healing is sufficient.

One of the most common and undoubtedly the oldest form of castration is where one-third of the scrotum is cut off and the testicles drawn out by the teeth of the operator. In this way the operation is performed quickly. Some object to this method, because they deem it filthy, yet many of them undoubtedly relish "lamb's fry." There may be, on the other hand, some grounds for objection through the entrance from the mouth of bacteria into the wound. Removal of the testicles may be effected by drawing them with the finger and thumb, but there is more danger of bursting the testicle in this procedure than where the removal is made with the teeth. A small pair of pinchers can also be used for this purpose. It is better to draw out the spermatic cord which is attached to the testicle rather than cut it with a knife.

In castrating old rams, the entire scrotum and its contents are removed by severing it near the body. Hot pinchers which sear the severed arteries and thus prevent bleeding are used in such cases. There are some who use this method in castrating lambs. An instrument especially designated for sterilizing, known as an emasculator, is employed for this purpose. In using it, the testicles are pressed upward and the lower portion of the scrotum cut off. The cords in this operation are completely severed. Swelling may follow but may be reduced by bathing with a warm disinfecting solution.

Show wethers should have a full "purse" or scrotum. If the entrance is made from the side the size of the scrotum is not diminished. Care must be taken that the opening is near the lower end so as to provide good drainage and prevent the collection of pus. The testicles are removed by the use of emasculators which cut through the spermatic cord.

Reasons for Docking

Manure collects on a long tail very readily and may become a prolific breeding place for maggots. In small lambs whose digestive tracts are unsettled, manure sometimes cakes to such an extent around the tails that defecation is impossible and death results.

2. The tail is useless and the blood which promotes its growth can be better utilized elsewhere.

3. Docking is an evidence of careful shepherding. Buyers leave the neglected flocks untouched until the last.

4. In the case of ewes a long tail is sometimes an obstruction in the act of copulation.

5. Docking adds greatly to the appearance of a sheep.

Methods of Docking

Docking, carefully performed, is seldom followed by bad results. True, a little bleeding may occur when a knife is used, but it does not usually attain dangerous or serious proportions. Generally a lamb when released after docking will run to its mother and commence sucking. This shows that the operation is by no means severe. Bleeding may be prevented by searing the end of the tail or, where the knife is used, by tying twine, which may be removed eight or ten hours after the operation, tightly around the tail above the wound. The most favourable age for docking is, in the instance of ewes, at ten to fourteen days old and, with rams, five to seven days after castration. Castration and docking may be done at the same time, but it is better in the case of small flocks to have an interval between the two operations. The tail should be severed at the third joint of the bevtebrae. Docking should be performed in the morning, so that excessive bleeding will be detected and remedied before night.

There are two methods of docking, firstly, by using a knife, and secondly, by the aid of pincers. The first method consists of placing the lamb between the operator's legs, its rear end in front of him, and of simply cutting through the tail from the underside at the desired joint with an ordinary heavy jack-knife. The joint can be found by feeling on the underside of the tail. The skin on the underside of the tail should be drawn up toward the body of the lamb, so that when the tail is severed it comes down over the end of the joint, which induces coagulation of the blood and facilitates healing. A little disinfectant on the wound assists the healing and prevents infection. The tail may be placed on a board and severed by means of a chisel and mallet, but the knife is more accurate and is not so liable to bruise the tail bones. In the second method, the operator requires an assistant and a pair of iron pincers are used. They are heated in a fire and the operation is performed while they are hot, thereby searing the wound which prevents bleeding. However, pus not infrequently collects underneath the scab which forms, and the suppuration which ensues may cause an aftermath of greater pain to the lamb than the sharp, clean cut of a knife. Of course, danger of infection is more liable from a knife wound, yet when clean bedding and strict sanitary measures are employed this will, to a very great extent, be obviated.

A few extracts from letters follow. These will serve to illustrate the viewpoint of packers, drovers and live stock commission agents with respect to the castration of ram lambs sold for slaughter.

"We believe that one-third of our total receipts of lambs are not docked nor castrated and these practically all come from the northern part of Alberta. Might say that a large percentage of the lambs from the southern part of

(Continued on page 487)

United Farmers of N. B. Hold Monster Convention

Fisher Hall, Woodstock, Would Not Hold Crowd and Gibson Opera House Was Used---Lots of Enthusiasm and Splendid Speeches

The United Farmers of New Brunswick got away to a good start at their organization convention, which opened in the Gibson Theatre, Woodstock, N. B., on Tuesday the 23rd inst. It was at first proposed to hold the meeting in the Fisher Vocational School, but the Assembly room was far too small to accomodate the delegates who assembled from all parts of the counties of Carleton, York and Victoria. It was estimated that 1000 of the leading farmers of these counties were present and the enthusiasm was such as to greatly encourage the promoters of the movement. When it is considered that the organization has only been in evidence since the early part of March and that there are already twenty active working branches, it will be readily understood that on this occasion at least the farmers mean business. Those who are primarily responsible for the pioneer work in connection with the organization are Thomas Caldwell, Charles L. Smith, Gordon Sharpe and W. F. Phillips. These men gave all their time, without charge, and when it was suggested that some remuneration be given them, they unanimously refused to accept compensation for anything they had done. This is the spirit which should actuate all farmers in bringing the United Farmers organization to a point where it will control the public opinion of this province. It is such a spirit of self sacrifice which will overcome all obstacles and prove that the experience of the past, when farm organizations have gone down one after another, will not be repeated in this instance.

The Association has appointed a permanent organizer in the person of Mr. C. L. Smith, who will visit all parts of New Brunswick in his effort to consolidate the interests of the farmers of the province.

The meeting was attended by Mr. J. J. Morrison, of Arthur, Wellington County, Ontario, Secretary of the Ontario branch of the United Farmers. Mr. Morrison gave the delegates the benefit of his wide experience and an excellent address which is published elsewhere.

Mr. W. F. Phillips was chosen Chairman of the meeting. He advised the farmers to get together in their best interests in order to meet the organization of the manufacturers and others. He referred to the organization work that had already been carried on and suggested that the movement was yet only in its infancy. Elsewhere the organizers have been accorded a good reception. From all sides were coming demands for new branches, and the only difficulty had been to find time and organizers to fill the engagements. He predicted that before the next annual meeting there would be a total membership of over 5000. There were no big salaries to pay and no large expense bills to meet. What the farmers wanted was to get together.

Mr. C. L. Smith, who was given a very hearty reception, expressed pleasure at seeing such a splendid represntation of the farmers of the county. Success meant benefits to themselves and their families. It was predicted that the organization would fail, but they were not going to fall down, as farmers they would stand together. He referred to the splendid results of co-operation in Canada, Maryland, Virginia and elsewhere. He thanked the farmers for their reception.

Thomas Caldwell was also splendidly received. He felt that it was the first time that the farmers of Canada had been really interested in co-operation, but he felt that in this venture they had the support of all. He referred to the splendid assistance of Messrs. Smith, Sharpe and Phillips and of their untiring energy in holding meetings at various places. He pointed out that every barber and blacksmith had a union of some kind in which prices were fixed and trade customs adopted. In the Dominion of Canada about 80% of the voters were farmers and if they stand together there was no doubt but that they could control the destinies of this country.

When Parliament met in the fall or the latter part of the winter, they formed a Union Government, which we can all criticize because there is not one separate party, or rather two separate parties, but one big party, and this is I think, the most fortunate time for us to organize. We have never had a government, who considered the interest of the farmers. We have been going after what we need. The manufacturers got word quickly that we wanted the duty taken off farm machinery and they went and asked the government not to take the duty off, and it remained as it was.

We are paying more not only for

(Continued on page 468)

St. John Standard Opposes United Farmers Movement

Ridicules Movement in Its Editorial Column, and in Its Market Report Quotes Prices for Mill Feeds Which Show Direct Violation of the Law--- It Wonders? Let It Be Patient

The following is from the editorial columns of the St. John Standard;

FARMERS IN POLITICS

"The announcement by the United Farmers' of New Brunswick, an infant organization which met at Woodstock this week, that it and affiliated bodies plan to co-operate in buying and selling and also participate in the formation of a new political party in Canada makes interesting reading. The theoretical part of the programme sounds well, but can it be applied practically? The economic phase of the programme has been tried before in Canada and the United States. In some localities it has failed and in others it succeeded.

"Neither is it a new thing for farmers to make an attempt to become active as a body in politics, and there is no question but that they deserve success, if their political policies are framed and propogated in moderation without a bombasic resort to extremes as was the sad case of the Populist party of the United States, which flourished prior to and during the spectacular Bryan free silver campaign. But in this campaign and in the old greenback campaign which preceded it, the agriculturists of the United States were far from being united. The farmers of the middle west and some far western states and in one or two southern states largely rallied to the suport of the Populist cause, and not only elected a score or more of members to congress and several governors, but controlled entire states in the contest for the presidency. The farmers of the east did not support Populist, although it made a strong bid for rural support there."

"Finally the Populists merged with the Democrats and Free Silver Republicans in support of Bryan for the presidency. Now the Populist part is practically extinct."

"These failures are mentioned to show the fallacy of extreme movements and the failure of the farmers to make their movement a truly moderate and national one."

"Regarding buying and selling so as to cut out the so-called middleman that has been tried in New Brunswick, through the Grange, and has failed. Across the border line in Maine a majority of the farmers have a very good organization, by which many of them buy from their association direct at cost price, plus expenses, cash figuring largely of course in the transactions. This plan works very well in the fat years, but in the lean years it does not work as well. Then they are obliged to rely on the country store keeper and produce dealer to finance them partially throughout the balance of the season."

"There is no doubt that the farmers of New Brunswick rely on credit too greatly, but many of them are obliged to use the credit system largely because of the long time between marketing seasons. Many of the large and reliable merchants and produce handlers of the province co-operate with the producers by extending credit and taking produce in payment. This plan is successful in many places, but of course there are bound to be some abuses of the system on the part of both sides."

"More of the cash and less of the credit system would undoubtedly aid all concerned. The selling problem is a difficult one, especially during these times when prices are variable, freight cars and vessels scarce and help short. The Maine potato men tried to solve the selling problem, but they like many others who have tried to do so have failed to solve it wholly to their satisfaction yet. In politics the farmers can be a power if they can get together and stick together, but the conundrum is can they?"

The above article is suggestive of the limitations of the average St. John newspaper writer. To read the St. John daily newspapers one would suppose that the Province of New Brunswick consisted of the City of St. John. In fact, we have often times wondered if the newspaper publishers in that city have not convinced themselves that the Winter Port constitutes the Maritime Provinces.

The difficulties into which the Editor of The St. John Standard has hurled himself may be traced to ignorance of the farmers co-operative movement in Canada. If he had taken the trouble to investigate he would have found that the United Farmers of New Brunswick is merely a branch of the Grain Growers of Manitoba, the United Farmers of Saskatchewan, the United Farmers of Alberta and the United Farmers of Ontario. If he had taken the trouble to investigate the career of this organization, he would have found that there is none of the "old green back campaign" about it. He must be aware that it was the united action of these bodies in Manitoba, Saskatchewan and Alberta which resulted in an overwhelming majority for Union Government in the three middle Provinces. Hon. T. A. Crerar, Minister of Agriculture in the Dominion Government, is the man who originated the movement and who may still be regarded as its head.

We may say for the information of the Standard that a permanent organizer for the United Farmers has been appointed in the person of Mr. C. A. Smith, Woodstock, a gentleman whose standing is unquestionable and whose work in eight weeks has resulted in an organization of over 1000 members in Carleton County, all of whom have agreed to forget that they are grits and tories for a portion of the year at least and work together as farmers. The Standard says "In politics the farmers could be a power if they get together and could stick together, but the conundrum is, can they?" The Maritime Farmer's answer to this question is "Watch them!"

The Standard is laboring under the delusion that the United Farmers are out to wreck every institution in New Brunswick. In this they are mistaken. The United Farmers is an organization designed to look after the interests of the farmers, just as the Typographical Union, which provides workmen to enable the Standard to publish, looks after the interests of those employees.

It is well to note that in the same issue in which this editorial appeared, the Standard's market report carried the following quotations:

Flour

Government Standard	0.00..	$12.05
Ontario	11.95..	12.00
Oatmeal, Standard	(no quotation)	
Oatmeal, rolled	0.00..	13.00

Oats, Feed, Etc.

Oats, per bushel	1.15..	1.20
Oats, car lots, bush	1.10..	1.15
Bran, car lots, bags	48.00..	49.00
Hay, car lots, ton	16.00..	17.00
Middlings, small lot	49.50..	50.00

Considering that bran can be bought in car lots at $37.90 per ton and the Food Controller's excess profit allowed on this commodity is $2.00 a ton, $49.00 per ton for bran looks high. Middlings can be bought, car lots, for $42.90. The Food Controller decrees that a profit of $2.00 per ton may be charged on middlings. Yet the quotation in the Standard is $50.00 per ton. Likewise the price for flour, delivered, war standard, is $11.40 per barrel, and the Standard's quotation is $12.05 per barrel.

If the Standard desires to discharge a useful duty it would send a reporter to Prince Edward Island, to the Annapolis Valley, to the counties of Pictou, N. S., and Antigonish, Nova Scotia, and it would then be able to determine to its own satisfaction that there are some pretty live farmers organizations in the Maritime Provinces. It might also look into the activities of the N. B. Agricultural Societies United, an organization brought into being by the Government, directed by Hon. J. K. Flemming. The Agricultural Societies United in the last three years has handled hundreds and thousands of dollars worth of fertilizers which have been distributed to the farmers at cost through the agricultural societies of this province. The result of the movement is that farmers have been saved as high as $15.00 per ton for fertilizers.

The farmers of New Brunswick need not worry themselves about the article in the St. John Standard. It was evidently written by some person not at all in touch with the political conditions in Canada or of actual farm conditions in the Maritime Provinces. The Maritime Farmer's prediction is that by this time next year the United Farmers of New Brunswick will have a membership of at least 10,000. Long before that figure is reached the St. John Standard will be "whooping it up" for the United Farmers of New Brunswick and telling them what good fellows they are.

Urgency Meeting of the N. B. Farmers Association

Fredericton, April 26th

Upwards of one hundred members of the New Brunswick Farmers' and Dairymen's Association and the United Farmers of New Brunswick, attended an emergency meeting of the Association called by the President, L. M. Anderson, to meet at Fredericton on April 26th, to protest against the conscripting of farm labor, as without efficient farm help, production of food supplies in New Brunswicw cannot be maintained and the increase looked for cannot be realized.

Presidents Address

In calling you together in this Emergency Meeting, I need not offer any extended remarks. You are all acquainted with the further amendments added to the Military Service Act.

TWO QUESTIONS confront the Country—MORE MEN and MORE FOOD. It is now recognized that the one is an extremity equal in necessity to the other.

We are not assembled to engage in controversy—rather to reach an agreement. Nevertheless, we farmers, who have spent our lives on the soil, offer no apology for our opinion on the Question of Food Production. We say to the Government, as earnestly and as sincerely as possible, that already more farmers have been withdrawn from the soil than normal production can withstand. Yet; to-day skilled farmers are summoned from our fields for Military Service. The result inevitably will be a failure of food production.

The Government nad the Farmers agree that throughout Canada a great number of persons eligible for War Service are either idle or not engaged in essential work. The design of the Government seems to be to draft these men to the farms,—while the skilled farmers are to be stripped from the soil.

I am confident that it is the conviction of every farmer that this unskilled and unwilling labor will prove useless and a positive burden and obstacle to our farmers, and that no increase in food production can result from it. It is an impossible task for the farmer to educate or adapt such labor. The farmer has not the power, nor has he the authority to enforce work from those unable and unwilling to perform it. But, on the contrary, Military authority intrinsically is able to direct the man power it enrolls, and to enforce toil and diligence from those subject to it.

Therefore, gentlemen, in my humble opinion, the issue now before us is this:

If Canada is to conscript the man power, which is idle or working in non-essential tasks, WHO shall educate it, harness it, and marshal it to effective War Service,—the Farmers or the Military Authority?—That seems to me to be the question before us.

The first of the week I thought it was time for us farmers to stand together and induce the Government to leave our skilled help with us, in order to produce larger crops than ever. I sent the following telegram to Mr. Carvell:

> "Is it possible that what few expert young farmers are left either on the farms or already in khaki are going to all be taken, and we larger farmers left to depend upon very inferior unskilled help from the Towns and Cities while thousands of htese young men are allowed to stay in offices and at other work in these towns and cities which is far from being as important towards winning the war as the crops that we farmers would be able to grow with the assistance of these skilled young farmers. Why not put girls or young women into thousands of these positions which these young able-bodied men hold in these offices and shops in our towns and cities and thus release the young men to fight. Sir, I make this suggestion as a loyal and patriotic farmer, because I know we cannot produce with this unskilled help anywhere near what we would be able to with the skilled labor.
>
> (Signed) on behalf of the Farmers of New Brunswick
> L. M. ANDERSON,
> Pres. N. B. Farmers & Dairymen's Assn."

The following letter I received in reply:

> "Dear Mr. Anderson,
>
> I have just received your telegram of the 22nd instant re the conscription of farmers, an sympathize with every word you say. The situation of this war, however, has reached far beyond the question of sympathy. The men to whom you refer in cities and towns will be taken just the same as those from the country districts, and while I am sure there will be some loss, yet it is impossible to draw any distinction between country and city.
>
> Sincerely yours,
> (Sgd) F. B. CARVELL.

(I might just say the reason I used the words "cities" and "towns,", Mr. Carvell had used the expression that there were tens of thousands that could be drafted; that is why I referred to it in the telegram).

The President named a Resolution Committee consisting of

Frank Riley, Melrose,
A. C. Fawcett, Sackville,
F. B. Doncaster, Sackville,
Louis St. Onge, St. Jacques,
C. M. Shaw, Hartland,
C. L. Smith, President United Farmers of N. B., Woodstock,
Robert Hickson, Bathurst, and J. T. Prescott, Sussex.

The committee convened immediately and while awaiting their recommndations the following discussion took place on the draft situation.

Mr. Gordon A. Sharpe—Sec'y.-Treas. for United Farmers of New Brunswick.

The man who helps me on the farm has been with me seven years. He takes care of all the outside work and I take charge of the stock. If I lose that man to-day, I cannot replace him, —the men or boys from the town will simply be no good to me. I tried boys last summer and I simply want to say I don't want those boys on my farm this summer. Certain days you could use those boys, but to keep them steadily on the place is simply a waste of money and a waste of my own time in watching them and directing their work.

I think this is one of the most serious situations that could possibly affect the agricultural interests. Instead of taking my man from me two months ago, when I could have hustled around and made some provision to meet the situation, we only hear now when we are ready to start the work. On account of so many men being taken, I consider it impossible to get help on my place and in consequence I will have to greatly curtail my crops this summer.

Mr. Anderson.

I agree with Mr. Sharpe in his remarks and I believe, from our own situation around Sackville, it will be the same and that it will be the same all over the Maritime Provinces. Dr. Robertson, on the 26th of March, stated that it was just possible that in 1919 and 1920 that the farmers,—and not only the farmers but the people on the North American Continent,—would have to kill our live stock in order to feed the Allies and our friends across the water. If that is so, it seems to me there should be something done so that we farmers could produce all we can.

Judson Corey

The Greater Production Committee had at first an up-hill job in getting the farmers interested, but after heart-to-heart talks with the farmers in different parts of the province, they have succeeded in getting an enthusiastic interest. We have taken hold of this with the determination that we will do our full part that Democracy might prosper throughout the world.

After we made these preparations, after men have spent large amounts seed, fertilizer, etc., this Resolution is brought down that takes away the labour to enable us to carry out our plans for greater production. I know in the County from which I come there will be thousands of acres that will never be planted this Spring. Men, impracticable men, men good enough in their hearts, but with impracticable ideas, could not assist us. We have been through the mill. I had to depend on school children and on girl labor throughout the last few years. I take all kinds of labor such as I can get,—but I had last year 150 bushels of buckwheat that laid out in the winter storms. This does not make so very much difference to me, but the British Empire and the cause of the Allies cannot stand this sort of thing. Part of the crops that are planted will become a waste, if this Resolution is carried out,—and it will be the boys in the trenches and the Allies across the water who will miss all this. If this amendment is carried out, not only will there be no increase in production, but they cannot keep up one-half of the average production.

So the question resolves itself to this,—which is the most necessary thing? If men are needed, take us all, old and young; but if the food is necessary all the men in the world will not save the Allies if they are more than 24 hours without food. They must be fed and surely some plan can be conceived which will withhold the operation of this Act so that we can sow and harvest the crop,—for a crop sown and not harvested had better never be sown.

Hiram Manuel.

If the farmer with one or two sons has them called away, in some cases he will not financially be able to stand it. We have to pay a big price for everything and there is many a farmer who wouldn't feel able to undertake to put in a crop, not knowing what the result will be in the Fall. Should the crop prove a failure, where is the mon ey to come from? Last year we were encouraged and induced to increase production. I think nearly every farmer in the province did what he could, they ran heavy fertilizer bills and did what they could. Now it is poor encouragement for a farmer to step out and hire money to put in his crop and not perhaps have any crops when it is time to harvest. It seems to me we ought to do something to save the men on the farms, if food stuff is required. Hired help do not take the interest in farming that our own boys do. I have no boys who will come under the draft, but there are men all around who have. We may find in some instances where they would take the only son of a widowed mother and she would be unable to get help to work her farm. Hired help always expect to get off early when night comes and they will not take the interest their own boys or girls would who hav always been accustomed to farm work.

Before a man can take a gun and go in the trenches he has to be trained six months or a year. Why should a man be expected to go on a farm and start to work without training, than to take a gun and go right in the trenches? I think there should be some way that a readjustment could be made so that we could have our skilled labour left in the country, as long as it is needed for food production. We know tbat a man cannot work when he is hungry and we certainly must produce the food, in order to feed our Allies across the water. I do not want anyone to think that we will not do or best in every way, but as our country is calling for Greater Production, I feel we should have our skilled labor left on the farms.

Mr. R. K. Tracey.

I find that the farmers have been called upon in the last six months to do everything possible to increase production. The farmers have nobly responded, they had good courage and were willing to work almost day and night to accomplish the result we were called on to obtain. We were urged and told the result of the war perhaps depended more on us as farmers than it did on the boys in the trenches. We, as farmers, felt that responsibility. The Government cooperated in every way possible to help the farmer, regarding seed grain, etc., and the farmers were planning on a bumper crop for this season, but, gentlemen, being connected with the distribution of seed throughout Carleton County, I find that the farmers who were clamoring for seed two weeks ago are now hesitating. They say, and justly say, it will be impossible for them to sow the seed and gather the harvest. There are farmers in our locality with boys in the trenches and only one son at home. If those now on the farms are taken, it will mean the older farmers will have to shut down their farms.

They tell you they will furnish city help,—they might just as well train those men for the trenches than to take skilled farmers and put them in the trenches. If you take a skilled farmer from the farm, you have to train him for the trenches, and if you take a city man you have to train him for the farm. It is my opinion they should take the men who should go and leave the men who should be left.

Another thing I cannot understand. The U. S. say they can put 3,000,000 men in the field in one year, if they can furnish ships to transport them over. Why couldn't the same ship that transports the Canadians take over the men from the U. S.? Canada has put the army in the field, it is only fair that U. S. should fill the gaps for a time. What is the use of sending our men over there, if they go there to starve, as they tell us they will if our production is not greater? If with the help we had on our farms last year we only produced a normal crop, how could we be expected to produce 50% greater this year, with perhaps 50% less help? We, as farmers, have been told that we are kickers. Gentlemen, we are not, we are willing to do whatever we can. I, for one, if I can be more benefit in the trenches than I am on the farm, I am ready to go.

Mr. F. H. Crouse.

This must be a very serious matter, or there wouldn't be so many of us here to-day. If the boys are all taken off the farms, instead of increased production, there will be decreased production. There was a man here a few days ago who told us that the farmers should guarantee to produce five acres more than they have produced. I might say right here for our section of the country, it will be from 5 to 10 acres less production and I think that we should move along these lines and see if we can get a guarantee from the Government that this is necessary. If we do not need greater production, it will be a different thing. A boy, up until he is 22, is not much good on the farm. A boy of 20 years of age has to be watched to see how he is getting along.

I know several cases in my locality where the boys should be left. There is one man with 3 boys in the trench-

UNITED FARMERS UNDER WAY

The organization meeting of the United Farmers of New Brunswick, which was held at Woodstock, on the 23rd and 24th insts., was one of the best gatherings of farmers ever seen in the province of New Brunswick. When it is considered that delegates, nearly all of whom came from the County of Carleton, filled the largest theatre in the town of Woodstock, it will be understood that the farmers are beginning to sit up and take notice.

The object of the United Farmers is to bring into closer co-operation the farmers of Canada. In Manitoba, Saskatchewan and Alberta, where the organization is conducted under two names, the United Farmers and the Grain Growers, the men who till the soil are able to control the political situation in the three provinces and in the Dominion so far as it affects these three provinces. In Ontario, where the movement is of comparatively recent birth, there are already 12,000 members. British Columbia nd New Brunswick are now being organized. The New Brunswick movement had its conception less than three months ago and already the membership has passed its first thousand.

It is the intention of the United Farmers to organize every county in the province of New Brunswick and with that end in view Mr. C. L. Smith of Woodstock has been appointed provincial organizer. He is one of the originators of the movement in New Brunswick and has promised to devote his whole time to the work.

The Maritime Farmer has been appointed the official organ of the United Farmers of New Brunswick. It has no hesitation in endorsing an organization which has done so much for farm life in western Canada. There is no reason why the farmers of Canada should not be represented in the legislatures of the various provinces and in the parliament of Canada by men who have at heart the interests of agriculture and clean government. It is high time that the political machines in this country ceased to turn out millionaires. We have a Union Government at Ottawa, which is demonstrating, in a measure, that the affairs of this country can be conducted without spending millions on graft propositions. As a matter of fact people are becoming tired of the everlasting series of accusations of graft which have been directed by one party against the other.

At this time when men are dying by hundreds of thousands in the trenches of France, people have little interest in "peanut politics." If the farmers of Canada make up their minds to clean up the public life of this country and send a few crooks to the penitentiary they can do so.

The United Farmers of New Brunswick are off to a good start and better things may be expected of this movement than of any other that has been launched in the province of New Brunswick.

INCREASED PRODUCTION

"Increased Production" is one of the factors that will help win the war. Still it is something that cannot be accomplished by talking about it and with help more scarce than it has ever been in the Maritime Provinces farmers will have to face difficulties such as have never confronted them. But that is what the Canadian boys in the trenches have been doing, and after all, those of us at home have the light part of the burden. To see that the men who are fighting are properly fed and clothed is a duty we owe to them. Maritime Province farmers will make every effort to meet the demand for increased production. The wheat acreage in the three eastern provinces will be the greatest in their history. Never before has so much ground been broken for wheat and it will be all badly needed before the harvest of 1919. The outlook for food in this country is more alarming than most men care to suggest. The question of famine is not so remote as many suppose. A bad crop ni 1919 would bring upon us unthinkable disaster. The question that confronts every man and woman in this country is can we produce sufficient food to supply our wants and those of the men at the front. Every person who eats, and we all do, has a vital interest in greater production.

THE HALIFAX GARRISON

We understand that a number of the officers without overseas service have been removed from the Halifax Garrison. However we are informed that there is still a large number of men filling officer's positions in Halifax who have been there since 1914. At the same time there are in Canada hundreds of qualified officers from the trenches in France, who are unable to find employment. We have at Ottawa a government elected to conduct the affairs of this country on a war basis and the Maritime Farmer has no hesitation in saying that all officers in the Halifax Garrison who cannot show overseas service should be fired. There should be no further delay in cleaning up the awful mess which exists in that city. There is only one place for a man to wear khaki and that is in France, provided he is physically fit. Men who have been wearing khaki since 1914 and have never seen duty outside of the garrison walls of Halifax should hand in their resignations or the government sould discharge them at once.

An employment law has just been passed by the Dominion government in which provision is made that "every male person residing in the Dominion of Canada shall be regularly engaged in some useful occupation." The Maritime Farmer would suggest that some of these heroes of the 1914 "Home Defence" class be taken out and put to work on the farms of Canada. They would then be giving their country far better service than at present and the government would be saving thousands of dolars, which is necessary at this time. To suggest that men from overseas are not fitted in every way to dicharge the duties connected with the Halifax Garrison is to offer these "real fighting men" a gratuitous insult.

It is time for further radical changes in connection with the Halifax Garrison.

NO LOAFERS ALLOWED

The Dominion Government has passed a most drastic law in regard to loafers. Any man who refuses to work is liable to a fine of $100 and costs or imprisonment for six months. There are in the Maritime Provoices men who have not worked and who will not work. They are to be found in the towns and in the country places. Every municipality has a right to see that men living within its jurisdiction engages in some useful occupaton. It is an excellent law and one that should be enforced to the letter. Men who refuse to work voluntarily sould be made to take up their part of the Empire's burden.

The order-in-council providing for enforced occupation to all males in Canada is as follows:—

1. Every male person residing in the Dominion of Canada shall be regularly engaged in some useful occupation.
2. In any proceeding hereunder it shall be a defence that the preson is.
   (a) Under sixteen years or over sixty years of age.
   (b) A bona fide student proceeding with his training for some useful occupation.
   (c) A bon fide student in actual attendance at some recognized educational intitution.
   (d) Usually employed in some useful occupation and temporarily unemployed owing to differences with his employer common to similar employees with the same employer.
   (e) Physically unable to comply with the provisions of the law as herein enacted.
   (f) Unable to obtain within reasonable distance any kind of employment which he is physically able to perform at current wages for similar employment.

* * *

A thorough cleaning and white-washing after cattle are on pasture means greater comfort and fewer flies about buildings all summer.

* * *

Growing mangels, turnips and carrots for seed is very simple and does not require special skill or capital.

* * *

It will pay to collect and burn all brush from the clearing of land, prunings from the orchard, and other waste woods that may be about the farm and wood lot and save the ashes.

* * *

Do your present barns not need more light, better ventiation, more sanitary floors or some repairs? Some of this work may be preferred on rainy days.

* * *

As never before, rainy day jobs must be planned this season, so that they need not be done while the weather is favorable for any other line of work.

* * *

Owing to the urgent demand for increased food production, the scarcity of labor and the high price of materials it is doubtful if very many new farm buildings will be erected this year. We believe it would be advisable, however, for many farmers who have no silos to plan for one and grow bumper crops to fill it and thus help out the sortage in mill feeds.

Lime and Its Uses in Agriculture

Lime in Agriculture

During the last few years there has been a great deal of interest taken in the question of applying lime to farm lands. Yet many farmers appear to have no common understanding of soil acidity, its causes, its effects, tests which may be made in the field, what materials may be used to counteract it, and many other points in connection with this question.

It must not be thought that all soils are acid, for some, by reason of their origin, are well supplied with lime. These are almost invariably strong, productive soils, and stock fed on their crops are thrifty, with plenty of bone. On the other hand, large areas of land are just as naturally poor in this constituent from the outset, and under cultivation, the supply is soon so reduced that there is not enough of it to do the work which has apparently been assigned to it in crop production. Stiff clays and wet, low-lying and ill-drained soils are apt to become sour, probably due to the fact that there is little chance for the acid materials found in the soil to drain away. Such soils should be drained first and then lined.

Combined with the fact that some of the soils of the Maritime Provinces are sour and that the natural changes taking place in any soil tend in that direction, we have the other fact that few, if any, of our farm crops can make their best growth in a soil carrying a poor or insufficient supply of lime. In the case of legumes an abundance of lime is essential. In fact it is probable that the frequent faliure of clover to come through the first winter is due to lack of lime in the soil.

Lime has three main actions in the soil, it neutralizes the acids formed, it improves the physical condition, and it is apparently essential for the proper development of certain plants and organisms in the soil.

How Soils Become Acid

The acidity of a soil is due to the presence of acids or acid salts, and they may be either organic or inorganic. We are familiar with the fact that sweet immature corn makes sour silage, sweet cider ferments to vinegar, and that sweet milk will sour. In a similar manner organic matter such as green manures, crop residues, and farm manures undergo fermentation or decomposition in the soil and produce acids. If this acid is to be counteracted or neutralized, there must be some material of an alkali or basic nature present to combine with the acid and form a neutral salt and thus destroy the acids formed. This is one of the functions of lime in a soil. If the soil is naturally poor in lime, or has been depleted of its natural store of lime, the soil will probably be sour.

The natural chemical changes that take place in a cultivated soil tends to bring its soluble plant food constituents into a soluble form. These changes are essential to render the food available to the plant. But, among these food constituents, lime, at least, is rendered soluble faster than is necessary for food purposes. Naturally, unless it is again taken up in an insoluble form, it must gradually be carried downward with the water that sinks into the soil. For this reason the water of wells of many springs, and of our rivers is hard and limey. For the same reason a subsoil contains more lime than a surface soil, and the latter may become so leached that it does not contain sufficient lime to neutralize the acids formed in the decay of the organic matter when the soil becomes acid or "sour." It is well to remember that the richer the soil is in decaying vegetable matter and the more thorough the cultivation, the faster the lime will be rendered soluble and leached away. For the same reason, the longer the land has been under cultivation, the more likely it is to need lime. Thus it is many years since some of the lands of England and Scotland needed lime. The same is true of much of the land in the States to the south of us, and now our, comparatively speaking, newer lands are reaching the same condition.

During a season's work on soil survey in Ontario, abundance of evidence was produced to show that these changes had progressed far enough to render the application of lime a necessity in many districts. In the course of the summer's work thousands of borings were made in the soils of the counties studied. In most cases the surface soils were acid to litmus paper, and there was not enough carbonate of lime present to cause any apparent effervescence until a depth of 20 to 24 inches was reached. In some cases there was none even at 40 inches. Surface soil rich enough in carbonates to give an effervescense with acid was found in comparatively small areas. On such a soil it would naturally be useless to apply lime. In some other places the soil is not yet in need of lime, but the supply is working downward, while in other districts, there is great immediate need.

Many inorganic fertilizer materials tend to increase soil acidity. Thus sulphate of potash, muriate of potash, and sulphate of calcium, or land plaster, are neutral salts; but the basic part of the salt (potassium and calcium) is taken up by the plants more rapidly than the acid radicle, and the soil becomes sour. Ammonium sulphate has this effect in a double sense, because the nitrogen in the basic part of the compound, ammonium (NH_4), is nitrified in the soil to nitric acid and both parts of the original substance furnish acids.

Lime Improves the Physical Condition of Soils

But the addition of lime does a great deal more than simply neutralize the acid of a soil. It influences the tilth or texture of a soil. This is most marked and most beneficial in the case of clays and clay loams, rendering them less tenacious when wet, and more friable and mellow when dry. This it does by causing the fine particles of the clay to gather into larger units and makes the soil act more like one made up of larger patricles. This flocculation can be readily shown by carrying out the following experiment: Take two glass cylinders or jars, and place in each about a tablespoonful of clay soil, and nearly fill with soft water. To one cylinder, or jar, add about a teaspoonful of slaked lime, then mix thoroughly the contents of each jar by shaking and turning upside down and shaking. Allow to stand and settle. Note the difference in the size of the particles and the rate of settling. The flocculation does away with the stiff, waxy, impervious nature common in clays deficient in lime, and renders them drier, warmer, better aerated, with a larger content of moisture available for plant growth. It also brings about a more favorable condition for root development; improves drainage and permits the farmer to cultivate his clay soil earlier in the spring with all the advantages that naturally folow.

The action of lime on sandy soils is somewhat similar to that on clay, that is, it binds, or cements, the sand particles together; but the effect on the soil is different. It renders the soil closer in texture, and thus, being less open and porus, it does not dry out so readily in seasons of drought.

Lime Liberates Mineral Plant Food

In addition to neutralizing the acid of soils, and improving their physical condition, lime is also credited with causing certain chemical reactions in the soil whereby the inert potash and phosphoric acid are brought into an available form. In fact, the carbonate of lime appears to be the main-spring of many beneficial reactions occuring in the soil. Most of our soils contain immense quantities of potash in an insoluble form. Through the action of lime compounds these insolube potash compounds are broken up, the lime taking the place of the potash which is liberated in a form that plants can assimilate. In this way lime compounds may act as an indirect potassic fertilizer, which gives lime a double value at the present time when potash materials are so scarce and expensive. This effect is naturally most noticeable on clays, and more particularly with clover and other leguminous crops which have the greatest difficulty in securing their supply of potash from the soil.

Phosphoric acid, is largely held in the soil in combination with iron and aluminum in compounds, that are very slowly rendered soluble. The lime reacts with these with the formation of phosphate of lime which is more readily rendered available to the plants. Thus while lime does not directly supply either potash or phosphoric acid, it does help to bring that which is in the soil into an available form. Furthermore, it is generally considered that soils destitute of lime have little power of retaining plant food constituents when applied to the soil as fertilizers in the form of salts of strong acid.

Micro-organisms in Soils Cannot Develop in an Acid Soil

Thus far we have credited lime with neutralizing the acid of soils, improving the physical condition, and liberating mineral plant food from insoluble forms of combination. But it has still other uses in the soil. A soil worthy of the name must contain a supply of decaying organic matter, humus, or huums-forming material, which is the source and the storehouse of nitrogen, the most important and the most costly element of plant food. In this form, however, the nitrogen is not available as a plant nutrient, the material must undergo further changes with the formation of nitrates. The process by which this is brought about is known as nitrification, and is the life work of certain vegetable micro-organisms or bacteria within the soil. As these nitrifying organisms flourish only in a neutral, or rather slightly alkaline soil it is essential that some such substance as lime be present to neutralize the acids that are formed in the decay of the organic matter. The nitrate of lime thus formed is the principal direct source of nitrogen to the plant.

Then, there is another class of bacteria whose function is to fix atmosphere nitrogen within the soil. This is one of the micro-organisms which Professor Bottomley claims performs such an important function in his "Humogen," which has recently come into prominence. These organisms known as Azotobacter, are, so far as we know, present in all fertile soils. They have, apparently, a very important function to perform in adding to the soil's store of nitrogen, a function they cannot perform in an acid medium. Hence, again we have a reason for the use of lime.

A third class of bacteria important in agriculture is the nitrogen gathering bacteria associated with the legumes. The value of this agent in increasing the productiveness of soils is now well recognized; but it, like the other classes of bacteria mentioned, cannot perform its important function in an acid soil. This is doubtless one one of the reasons why an application of lime so beneficially influences the growth of legumes.

Taking into consideration, then, all the important functions which lime has to perform in the soil, and the fact that our soils are steadily losing their lime, it is evident why the application of this material is so important. Fortunately, we have abundance of the lime in our own country, and it is not a costly material.

How to Test for Acid in Soils

Many methods have been devised for determining the amount of acid in a soil, but none of these are suitable for field use. In most cases, it is sufficient to ascertain the fact that the soil is acid. For this purpose a fairly satisfactory test can be made with blue litmus paper, which can be purchased at almost any drug store. It is sold in sheets or in little "books" which contain about twenty-five or fifty strips of the paper about one-half inch wide and two or three inches long. This is the most convenient form in which the have the test paper. If the sheets are purchased, they may be cut into strips the size of those in the books and placed in a clean, dry, wide-mouthed, well-corked bottle to keep them from acid fumes. When this paper comes in contact with an acid it turns red.

A very simple method and a very satisfactory one in our experience of applying the test is to make a ball of damp soil, break it open and lay the paper on the broken surface, squeeze the parts together again and allow to stand for from five to ten minutes. If on opening the ball, it is found that the blue paper has turned red, the soil is acid and in need of lime. It is apparent that the hands must be free from acid and the soil damp enough to press into shape. Unless the soil is very dry, we have usually found that by getting a sample three or four inches below the surface there was enough moisture to answer the purpose. If the soil is moderately dry the change in color may appear only in spots and greater pressure or longer time may be needed to make a satisfactory test. The rapidity of change and intensity of color developed indicate to some extent the relative degree of acidity. To overcome accidental difference in the soil, the test should be repeated several times with samples taken from different parts of the field. In Bulletin No. 80, Dominion Experimental Farms, Ottawa, Dr. Shutt describes two methods which are not difficult to carry out, and may give more reliable results, especially where the soil is dry. These results are as follows:—

1.—"Take up, by means of a spade or trowel, a little of the surface soil from, say, half a dozen places on the area to be examined, and mix well, using the trowel or a clean piece of board. Do not handle the soil. Take a small quantity (a few ounces) of the mixed soil and, putting it in a clean cup or tumbler, pour on a little boiled water, and stir with a clean piece of stick or spoon until the mass is of a consistency of a very thick paste. Into this "mud" press o piece of blue litmus paper by means of a small stick or the back of a knife, inserting the paper until one-half to two-thirds of its length is within the pasty mass. At the end of fifteen minutes, carefully draw out the paper and note if the part that has been in contact with the soil has turned red. If so, the soil is acid."

2.—"Place a strip of blue litmus paper in the bottom of a clean, dry glass tumbler (preferably flat-bottomed) and over it place a round "filter paper" (purchaseable at a druggist's), or, if such is not readily obtainable, a piece of clean, white blotting paper cut to fit the bottom of the tumbler. On this put a few ounces of the soil to be tested collected and mixed, as already described, and pour on sufficient boiled water to moisten or wet the soil thoroughly throughout its mass, but no more, and set aside for half an hour or longer. To examine the litmus paper, the tumbler is invested; viewed through the bottom of the glass, its color will be well brought out against the white filter paper. As a check and to ensure that any change in color may

THE UNITED FARMERS OF N. B. HOLD MONSTER CONVENTION

(Continued from page 464)

machinery, but on Ford cars, as they cost one hundred dollars more in Canada than they do in Maine. Does it cost one hundred dollars more to make a Ford care here than it does in Maine? They can buy machinery cheaper in England than we can at the end of the factory. Why is it? Simply because there is a duty on machinery coming into Canada. As I was saying, we are paying this duty and the manufacturers are putting it in their pockets.

Regarding duty on mixed fertilizer, there is a ten per cent duty on two dollars per ton more here than in the state of Maine, because the duty is put on by the American firm who ships it in here.

The balance of farmers in this country want the duty off farm machinery and fertilizer. The government does get some revenue from the duty on fertilizer, and ther has been a good deal of American fertilizer. American firms are coming here to establish fertilizer factories next summer and when this is done we will cease to get any revenue from the duty on fertilizer. Why should we pay the duty into the manufacturers' pockets?

You have heard that the United Farmers movement wont last. It can't help but last if you get behind it and stay with it, but if you flunk the first discouragement you get then it's all off, but if you stay behind it you cannot kill it. Eighty per cent of the voters are farmers. Now I will show you three ways by which you will kill this movement.

The very first is lack of interest, At first you are interested and take it with a hurrah, then you are apt to become discouraged, and let yourself become disinterested. Secondly, you have to keep politics out of this. If not, you will split it. I might say we should be farmers first and politicians after, but it is better never to be a politician if you cannot keep politics out of the whole affair. We do not want things the way they were before. We want to elect twenty-five farmers at Ottawa. If we want the duty off farm machinery then we can get it, if you can form an independent party and have our own representatives elected to represent the farmers and report to the farmers and look after our interests. We could be the balance in power. If we slip off into this two party business we will be as we were before.

The third thing; should this organization start out like anarchists, we would be doomed. If you want anything wait until a meeting is called and discuss what it is you want; should it be the duty off farm machinery or anything else, find out what it is and decide definitely

If we think we want an independent party we had better decide long before election.

When this organization first started we were represented at the Farmers and Dairymen's meeting at Fredericton. When we got there we found that the report had gone ahead that we were coming to agitate. We were not very much pleased with the report that had gone ahead and were amazed. We went and saw some of the heads of the meeting and explained our errand and whey they found out why we were there, they treated us royally.

Mr. A. H. Margison of Centreville was asked to speak but begged to be excused.

Mr. J. J. Morrison, of the Arthur, Ontario, said:

Mr. Chairman and Gentlement, perhaps I should say fellow farmers, because when I look into your faces I see that you are, and see that you are men who have earned all you have and more. After listening to the previous speakers I feel that I would like to sit still and listen. This is the same sort of stuff as we want in Ontario. I did not come here to make a speech, I came here to have a heart to heart talk with my fellow farmers as I have had the privilege of doing in the other provinces. It takes a lot of determination to make this thing succeed—men in dead earnest—farmers in dead earnest. The time has come to organize.

While I am Secretary of the United Farmers of Ontarioo I am here to represent the united council of Alberta, Saskatchewan, Manitoba and Ontario, and I hope we will be able to add New Brunswick and Nova Scotia. I am here to extend a greeting to you and to enthuse you if possible. We must present a solid front to the opposition. Men say they are keenly interested in us, not to keep us from being robbed but to keep us quiet while we are being robbed.

In Ontario, four years ago, we took two days and a half to organize. You were going to try to do it in a day. Now you have a lot to do. Part of your work may be already done and you have been doing noble work, but you will find there will be a great deal to do after today. You must leave politics out of this and use common sense or just plain horse sense. That's the best kind of farmers politics. Mr. Caldwell said that we had a Union Government and this would be the best time to start. I was speaking to a man in Toronto and he asked me if I had the eight hour day system introduced in my farm. I answered "yes". I said I had eight hours in the morning and eight hours in the afternoon.

We must be sure and not allow ourselves to become disinterested. It is really the fact that we are so busy making a living that we have not time to think. My old father said the proper way to keep the cows in the field was to give them enough and not too much. If they didn't have enough they starve, and if they have too much they would be looking for fences to break down.

If you allow partizan politics to come between you, I am afraid your organization will come to an end. The first vote I gave was to kill my father's. We went to the polls together. What was the trouble? Lack of education, lack of information and everything else. There are two farmers, Tom Smith and John Jones; in this case we will let Smith be the grit for awhile. They live side by side, are the very best of friends, help each other when one is sick the other does his work. Election day comes and a difference creeps in. They go to the polls, not together but by roads in different directions, and they do the very best they can to kill one another's vote, and kill one another's interest. What is the trouble? Partizan politics. And so as in that case partizan politics will kill your interests. When we first came to this country the Indians inhabited it, but the shrewd white man wanted the land, so he set the Indians on one another. They killed each other off and now the white man occupies the lands today. The farmers are like the Indians in one respect. They get their living from the soil, but do not let us be like Indians in the other respect, and fight among ourselves. It is impossible to progress under such condi-

A Bicycle on the Farm Will Save your Horses, your Gasoline, your Time, and your Money

ALWAYS ready for instant use. Costs nothing for upkeep. When your farm machinery breaks down, or your motor car goes on strike, you can jump on your Bicycle, get to town and back with the spare parts, and make the repairs without any serious loss of time.

Be sure that your Bicycle is a "C.C.M." —the best is cheapest in the long run. Its first cost may be a trifle more, but it will stand up on the country roads, and will look well and run smoothly for years to come.

tions. We have allowed politics to drive us too far, and our industry has been driven to the ditch. It is a bankrupted industry today. Do you have to exhort men to make munitions? No, only agriculture is the bankrupted industry and does not attract enough men to do its own work. In Ontario last year, there were not enough men to take off the produce. This is a humiliating condition and our own fault. We have put the reins of the government into the hands of the other fellow. In the west the farmers control the government, in Saskatchewan, in Alberta and in Manitoba. And if we stand by them we will control the government in New Brunswick. A man in Toronto, in 1914, had been a grit for about twenty five years, but when the Government changed he bolted and got a good position, and now he is ready to bolt again if there was any sign of the government changing. This man sent for some of our men and said "You men are getting prominent in Ontario, and we think we should consider you and appoint a man on the commission to represent your industry. We would like you to name the man you want." I didn't take all he said at par value. He said "If you would nominate a couple so we could decide." I thought to myself, now if I nominate a grit, there will be a good reason for turning him down. So I did nominate a Conservative, Col. John Fraser, who had been a candidate in Brant, and one with whom we would be absolutely satisfied. Then I nominated Mr. E. C. Drury, a graduate of the Guelph Agricultural College, and I said "if you see fit to appoint him we will be happy." He said, "I am sorry Morrison, but that is not the kind of a man you want. You want a big business man who will do something for your industry. Just let me nominate one." And guess who he nominated? J. W. Flavell. He still has the appointment and has never resigned. We farmers never knew nor cared. Do you suppose that the labour men would have stood for the appointment of that man as their representative. Not on your life, because labour is organized. They know they can put any thing over on the farmers.

There was a member of the cabinet going to Toronto and I asked him to appoint a member of our organization to a certain office. When I spoke to him about it, he said "how many farmers in the province of Ontario give a damn who is appointed. They neither knew nor cared. We are just willing to drift and the politicians know it." What is the matter with us that we are satisfied to toil sixteen hours of the day and let the other fellow get the booty.

There is something wrong. We have laboured so long and hard that we are very apt to become discouraged. Once I heard a fellow say he had a cow that was so poor he didn't have energy enough to brush the flies off his own back. Are we in that condition? There were a number of fellows in an asylum and only two guards and I said, "I should think that you would be afraid," and they laughed at me and said, "Well you know crazy men never organize." Surely we are not in that condition. A man said to me this afternoon, "They will never get organized. They will run away at the first discouragement." It is only the barbarians that run away and cannot organize. The manufacturers association have only three thousands members and they have more power than any other organization in Canada. They prevented taking off the duty on agricultural implements. You have not heard anything more about it because the manufacturers went to Ottawa and it is probable that you will hear nothing more about it. However, you have the daylight saving now to help you work longer.

One thing more I would like to ask, "Is this a hopeless case? Are young men going to stand for it? They are not going to stand for this thing. They are getting tired .

They have a test in the asylum to

(Continued on page 488)

The Frost & Wood Mower

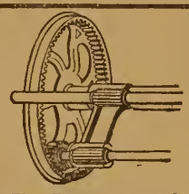
It takes off the heaviest, thickest crop you want to tackle. It's built so it's not laid up for repairs just the day the hay is ready.

Many a hay crop has been lost because just at the cutting stage the mower failed to do this work. Farmers who use the Frost & Wood Mower never have any mower-troubles—they'll gladly tell you so. This Mower is built with actual knowledge of Canadian field conditions extending over 80 years. Every sound feature of Mower construction we have learnt is embodied in our latest Mowers.

An important feature is the continuous cut of the knives. As long as the Mower is moving and in gear, the knives are cutting. You can raise the cutter bar (easily, without wrenching or straining) to clear an obstruction and drop it again, cutting full speed, saving time and getting more crop.

Frost & Wood Light Draft

It is our fixed policy to work for light draft as well as rugged strength. We use highest grade materials of proven strength and perfect fitting dust proof roller bearings at friction points, saving all possible horse power for the work at the knife edges. The Frost & Wood is a Mower you will always be glad you bought. Built in 6 ft., 5 ft., 4 ft. 6 in cut for 2 horses and 4 ft. and 3 tf. 6 in. cut for 1 horse.



The Famous Frost & Wood Internal Drive Gear

Just where the power is transmitted from the drive wheel to the shafting, we use the "Internal drive" principle as against the "external drive". We gear a small toothed pinion inside—a large toothed drive wheel—so both wheels mesh smoothly, run in the same direction and do not tend to work loose and throw each other, off, breaking teeth, etc., as in so many machines where the little wheel is outside the big one.
The F. & W. Mower is a compact, rigid, rattle-free, sure-working implement.

We have a special, nicely-illustrated folder describing all our haymaking machinery which we strongly recommend you to ask our nearest agent for, or write our nearest Branch—today.

DAIRYIN.G

GIVE THE BULL A CHANCE TO GET HIS QUALIFYING DEGREE AS A HIGH TESTER

Pictures and names of world's champion dairy animals are common. Below the picture the record of the individual is usually given. To explain what this record consists of and the conditions under which it was made will clarify the popular atmosphere on the question of what constitutes greatness in a dairy bull.

Some bulls are great through their ability to carry off the blue ribbon wherever shown in competition with other bulls of the same class and while such an individual is truly great, there have been cases whree the individual was neither the get of good ancestors nor the getter of outstanding progeny.

There are other great bulls made so by great masters who understand the art and science of advertising, but again this criterion of greatness does not always show the true value of the bull inasmuch as many of the world's greatest individuals have been lost before their greatness was known. Then. there can be no doubt but that a great many bulls have gone down to oblivion because they were always used on grade cows or because their daughters were owned by dairymen who did not believe in official testing.

Most bulls now known widely have. however, achieved fame because of the fact that their daughters were uniformly good milkers. In some instances this capacity to convert feed into milk has been handed down from the sire to the third and fourth generation of females. King Segis (86-75-46). The figures in the parenthesis are like so many hieroglyphics unless one understands them. Properly constructed they tell tales of greatness. They mean that King Segis had eighty-six daughters which were tested officially and came up to the requirements set by the breed for their age. King Segis had also seventy-five sons, each of which had sired at least one daughter that was tested officially and came up to the requirements. Out of his eighty-six tested daughters forty-six of them had heifer calves which became cows that came up to the breed requirements as shown by the official test.

What is a tested daughter Some breeders believe there exists a hokus-pokus about feeding which makes it possible for these cows to come up to the standard, hence they have no faith in the test and never try it. The idea is. however, far from the truth for many cows have made exceptional records with very ordinary methods. Moreover. it ma ybe said in candor that some record cows are fed rather elaborately . In great contrast, however, attention is called to the fact that many cows are fed elaboratetly. yet never come up to the breed requirements because they do not possess the inherent capacity.

How a Cow Is Tested

To show how a cow is tested. we will assume Jim Jones to own o cow that he believes capable of coming up to the association's requirements. He writes to the secretary of his breed association giving the name and number of this cow and the approximate date on which she will freshen . This information in turn conveyed to the state department charged with supervising these tests. As soon as the owner notifies the state department that the cow has calved, a tester is sent to start the test; he comes unheralded. He must be at the farm at least one milking period before the test commences and at this time he satisfies himself that the cow has been milked dry. At the next milking, the tester weighs the pail, sits in full view of the attendant while the milk is being drawn, then takes possession of the pail. contents and all. weighing the same on a pair of scales he brings with him. This weight is recorded in the tester's private record as well as on the stable milk sheet.

After the milk has been poured back and forth from one bucket to another four or five times, the tester dips out a pint or half-pint sample. Out of this he takes enough to make the Babcock test; likeswise he takes out an amount proportionate to the total weight of the milk produced. This last sample enters into a sample containing a portion of the milk at each drawing. This sample is called a "composite" one and is sent to the state institution supervising the test in order that the tester's averages may be verified.

This procedure goes on for seven days or as long a period as the owner wishes. Each milking is carefully weighed and tested and the official results are those which the tester comtests. This is what is known as an official test.

The semi-official test is one that is usually conducted for a year and the weights and tests are taken two days out of every month. seldom the same two days in the month. The tester shows up wihtout warning. weighs and tests the milk as in an official test and the fat percentage for the whole month is computed on th eaverage of the two days. If the weights given by the owner of the stable sheet do not materially differ from the general run of weights which the tester finds when he comes to the farm, the breed association usually takes the weights reported by the owner. This is called a semi-official test and is by many breeders given more credence than the official test because it shows what the cow can do over an entire lactation period rather than for a little spurt when she is at her best. Both tests are good, however, and the short-time test has the advantage in that it can be conducted a little cheaper. At the same time, it shows what the cow is capable of doing when up to maximum speed.

A point rarely mentioned is that practically all of these high-record cows are milked three times a day. Some breeders claim this to be impractical and hence should be discontinued. but the fact is that a cow high in milk will produce enough more to pay for the added time incurred in making one or two extra sittings.

Bulls receive their Ph. D.'s when their daughters can qualify under these rigid and searching reuirqements. "By their fruits ye shall know them" applies to bulls as well as men, and under these conditions the truly famous bulls of the dairy breeds are so because they have been able to leave their impression on the dairy cattle of countless generations to come.

THE TRUTH ABOUT MILK

Under the above title there appeared an interesting and authoritative article by Dudley Harmon in the March issue of the Ladies' Home Journal. We congratulate the author and the editors on giving their readers some real information concerning milk and as they express it. "while it is high, yet it is cheap."

Dairy and farm publications have published much on this subject. and it has been valuable in educating the producer, but it is the consumer who must be reached. If we want to reach that consumer, if we want to protect the dairy industry and save the caves, let us devote our money and our time to advertising in the publications that reaoh the consumer and educate the editors of these publications so they may speak understandingly of the subject.

If you haven'e read Mr. Harmon's article. get it. read it, and show it to your neighbors and your friends in the city. Here are a few sentences chosen at random:

"The cause of food conservation for ourselves and our allies will be helped if we all use more and more milk and milk products."

"Do you know that milk is not merely one kind of food, but a combination of all the food essentials required by the body—particularly of the growing child?"

"A greater demand at home for milik and milk products will stimulate increase in cattle herds. and we may thus contribute a part toward the restoration of the depleted meat and dairy stocks."

"There has been, and is. something wrong indeed, but the question of just what is the matter cannot be answered

Not made over—
Not added to—
Built right, basically

That's the Sharples Suction-feed Cream Separator.
No loss-alarm tacked onto it to remind you to turn faster.
Sharples *skims clean at any speed,* so it is not necessary to put on a contraption to prod you up to a fixed speed. You can judge how important this is when tests show that 95 per cent. of all separators are turned under speed much of the time, causing a waste averaging 10 pounds of butter per cow yearly. Sharples *saves* all this—*automatically.*

SHARPLES
SUCTION-FEED
CREAM SEPARATOR

The skim-clean-at-any-speed principle (suction-feed) is built into the Sharples, just as Nature built teeth into you. When you don't have any Nature-teeth, store-teeth are better than none, but they never measure up to the built-in kind. Think that over! Sharples construction has also eliminated troublesome discs—the simple tubular bowl containing but one piece. There are only half as many parts as in other separators — that's why a Sharples lasts longer than any other. Write for catalog to nearest office, addressing Dept. 79.

by accusing the dairy farmer and the milk distributor of robbing the public."

"For the welfare of the nation's children continuation of normal amounts of milk in their diet is imperative; for adults it is most desirable. The higher prices are, generally speaking, truly justified. and our national interests in the war require a liberal encouragement. in every way, of the cattle and dairy industries."

HOLSTEINS BEST FOR ECONOMICAL REASONS

Economy has become the watchword of the whole world and the dairyman-farmer needs to know exactly what each cow consumes and what she gives back in return for that feed. It is a simple matter to weigh up the feed and enter it in a ledger or on a sheet of paper; then weigh up the milk from each cow every day and total up at the end of a week the cost of the feed and the money received for the milk. In the course of a month or two there need be no difficulty in discerning the money makers and short work should be made of any cows that are found to be actually money-losers; an owner is perfectly justified in sending such animals to the block after he has given them a fair trial and can see no immediate signs of any improvement in their behavior.

Holsteins stand supreme ac eonomical producers and here is where the farmer and dairyman who owns a herd of the big-producing Black-and-Whites hlods an advantage today. As the result of some extensive and careful investigations carried out by the Wisconsin agricultural experiment station among the cows of the various breeds in the university dairy herd from 1898 to 1906, it was decided that the Holstein cow ranked first in production of butterfat and in net profit returned above the cost of feed eaten. The average annual production of butterfat and net profits returned above the cost of feed eaten. The average annual production of butterfat and net profits returned by the representatives of the various dairy breeds then kept in the university herds as follows:

	Avg. Annual Production Butterfat	Avg. Annual Net Profit
Holsteni	337.5	$46.89
Jersey	312.6	42.26
Guernsey ...	297.0	40.74
Red Polled..	295.5	37.68
Brown Swiss	278.0	38.50
Shorthorn ...	264.7	34.44

—Holstein Friesian Bulletin.

MILK CHEAPEST FOOD AVAILABLE

A Colorado bulletin says: "To get a clearer idea of how dairy products meet present day needs, the following comparisons are made on milk:

One quart of milk on an energy basis equals: 2 pounds chicken .79 pound steak; 8 eggs; 3.35 pounds oysters; 7 oranges; .76 pounds of fish; 6.55 pounds tomtaoes; ½ dozen bananas; .79 pound English walnuts; 3.5 pounds asparagus.

Figuring this on a price basis (Colorado prices March. 1918), one quart of milk at 12½ cents is worth as much as: 60 cents worth of chicken; 28 cents worth of sirloin stake; 20 cents worth of eggs; $1.33 worth of oysters; 22 cents worth of fish; 40 cents worth of oranges; $1 worth fo tomatoes; 17 cents worth of bananas; 21 cents worth of English walnuts; $1 worth of asparagus.

Good milk at 15 cents per quart is by far the cheapest animal food on Colorado markets today, and the more the consuming public use of it the cheaper will be their living expenses, and the better nourished will be the people.

THE COLOR OF CREAM

That the yellow color of cream and butter may be the result of bacteria present in the cow's milk as it leaves the udder, or which develop later, is the statement of R. F. Bourne, of the Colorado Agricultural College. There is. of course, the other source of good color. which comes from two common pigments of vegetable origin, called "carrotin" and "xantholophyll" which become assimilated more particularly by the Jerseys and the Guernseys. and are eliminated from the body in the milk, imparting the rich color.

These plant pigments are quite harmless, but of course have no nutrient value. However. no one relishes the idea of consuming milk or cream which owes its apparent richness to swarms of bacteria, even though they may bear a fairly good reputation. Moreover, some of them are decidedly deleterious to health. The use of well cleaned and sterilized utensils, with due regard to the hearth of animals, including the condition of the udder, are usually sufficient to avoid such abnormalities as yellow milk. "bloody" milk, ropy milk. and other similar conditions, says Prof. Bourne.

THE COW THAT IS PROFITABLE

Perisstent milkers, the kind that milk well for a whole year. not the type that yield abundantly at first and then soon drop down in production. are the winners in the long run. The steady cow is usually the most profitable one. Some cows yield considerably above the average at the first of their lactation periods, but within two or three months their yield falls nearly a third and by the end of the period may be only o fourth of the original production. Cows tend to decrease in milk flow as the dactation period advances. The percentage of fat gradually increases as lactation advances.

IF COWS COULD TALK

"Good morning, Mrs. Fawncoat. I hear that all the cows in the county are joining the 'Win-the-War' Club."

"Yes, Mrs. Starface, the Dominion Government authorities say we must increase the production of butter-fat, and we cows have all promised to do our 'bit.' "

"There's one thing I want to say right now," spoke up Mrs. Black. "The farmers have got to back us up in this movement. I'm with the rest of you, heart and soul, but what chance have I got?"

"Why, Mrs. Black, what's the matter? You have a fine warm barn and plenty to eat and drink."

"Yes, I know; but what can I do as long as they use that old cream separator on the place? It never was any good, anyway, and now it wastes so much cream I'm just plain discouraged."

"Well, you're not so badly off as some cows, where they haven't any cream separator at all."

"I don't know about that. There's a lot of cream separators in this county that are only 'excuses'—not much better than none at all. I tell you, Mrs. Fawncoat, with butter at present prices and our Allies begging every one to save fat, it's almost a crime to waste butter-fat the way some or these farmers do."

"That's one thing I'm thankful for," said Mrs. Fawncoat, "there's no cream wasted on this farm. We have a De Laval Cream Separator and everybody knows that the De Laval is the closest skimming machine."

"Well," said Mrs. Starface, "we never used a De Laval on our place until last fall and supposed one separator was about as good as another; but, honest, the De Laval is the first cream separator we've ever had that gave us cows a square deal."

P. S.

Of course your cows can't talk—but if they could you'd never have a moment's peace until you got a De Laval Cream Separator. Remember that a De Laval may be bought for cash, or on such liberal terms as to save its own cost. See the local De Laval agent, or if you don't know him, write to the nearest De Laval office at below.

MONTREAL

Country Produce

The receipts of eggs today were very large but, notwithstanding this fact, the tone of the market ruled about steady and no further change in prices was announced. The demand for supplies in a wholesale jobbing way continues good, which indicates that the consumption is keeping up and this, coupled with the large quantities being put away in storage, keeps the market pretty well cleaned up of any surplus, and, on the whole, quite an active trade was done. The receipts today were 4,751 cases, as against 3,600 for the same day last week, and 3,484 for the corresponding date a year ago.

We quote wholesale jobbing prices as follows:

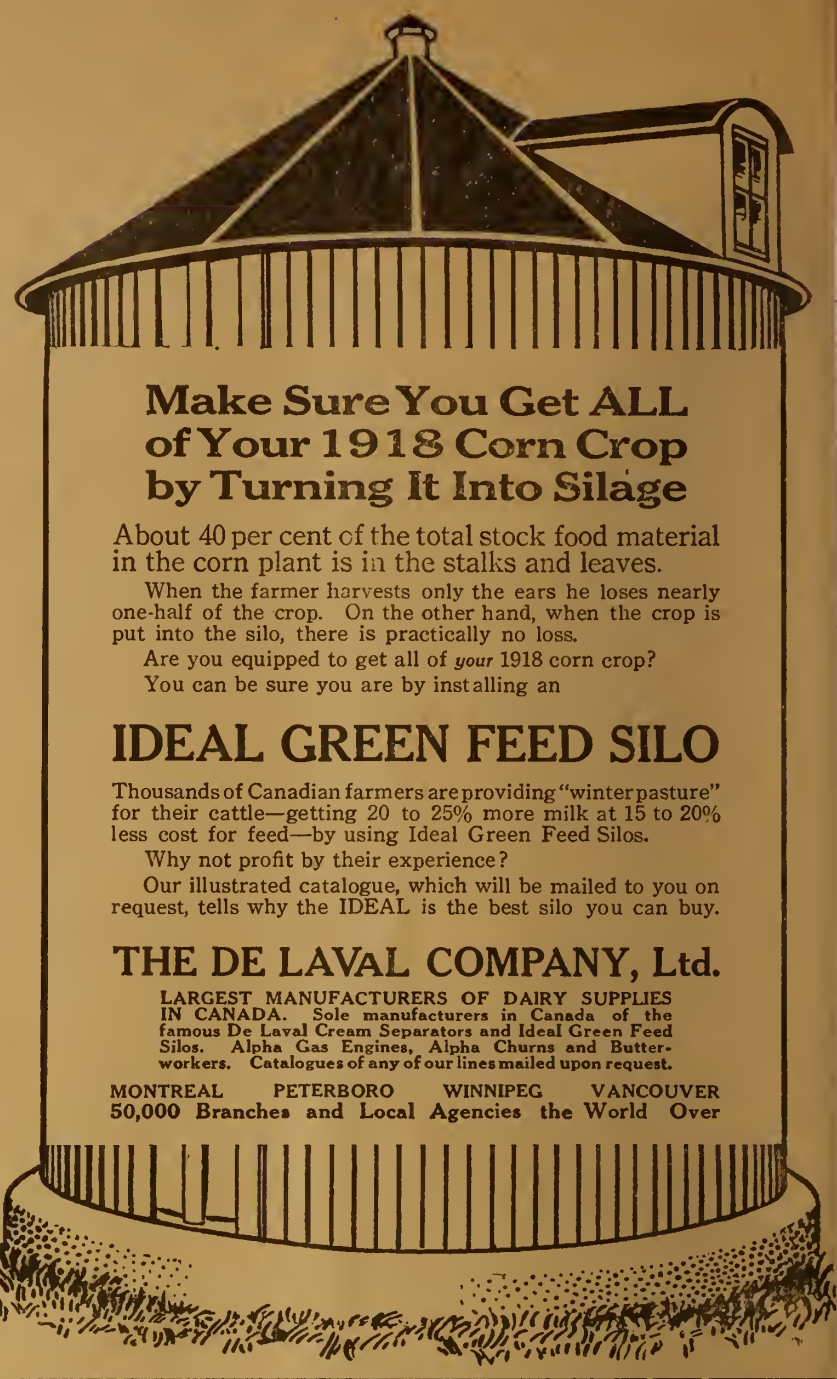
Selected stock.....43c to 44c
No. 1 stock.....40c to 41c
No. 2 stock.....37c to 38c

There were no further developments in the market for maple product today, prices for maple syrup being steady at the recent reduction noted. There continues to be a steady demand for supplies for local consumption and for shipment to outside points, and a fairly active trade was done, with sales of 15 to 20-gallon barrels at $1.75 per gallon, five-gallon tins at $1.80 per gallon; one-gallon tins at $1.90 to $2.; and 8½-lb. tins at $1.40 per tin. The tone of the market for maple sugar remains firm, with fairly active business passing in a wholesale jobbing way at 21c to22c per lb.

Owing to the more liberal supplies of potatoes coming forward, an easy feeling prevails in the market, and the prospects are for lower prices in the near future, but no actual change has been announced as yet. The demand is fair from some sections for car lots and sales of Green Mountains were made at $1.40 to $1.45 per bag of 90 lbs. in bulk; reds at $1.40 to $1.45, including bags; and McIntyres at $1.30 to $1.35 ex-track, while in a wholesale jobbing way Green Mountains sold at $1.70, reds at $1.60, and McIntyres at $1.50 per bag of 90 lbs. ex-store.

Dairy Produce Trade

The receipts of butter today were 1,074 packages, as against 367 for the same day last week, and 522 for the corresponding date a year ago. Owing to the continued liberal supplies coming forward, which are in excess of the daily requirement of the trade at present, and the quality of the stock, the tone of the market continues weak and prices today scored a further decline of 1c per lb. for both wholesale and jobbing lots. The demand was better today and a fair amount of business was done in a wholesale way, with sales of finest creamery at 44½c to 45c per lb., and in a jobbing way solid packages sold at 46c, and 1-lb. blocks at 47c per lb. At Gould's Cold Storage today the offerings amounted to 400 packages, which sold at 41c per lb., f.o.b., country points.



Make Sure You Get ALL of Your 1918 Corn Crop by Turning It Into Silage
About 40 per cent of the total stock food material in the corn plant is in the stalks and leaves.
When the farmer harvests only the ears he loses nearly one-half of the crop. On the other hand, when the crop is put into the silo, there is practically no loss.
Are you equipped to get all of your 1918 corn crop?
You can be sure you are by installing an
IDEAL GREEN FEED SILO
Thousands of Canadian farmers are providing "winter pasture" for their cattle—getting 20 to 25% more milk at 15 to 20% less cost for feed—by using Ideal Green Feed Silos.
Why not profit by their experience?
Our illustrated catalogue, which will be mailed to you on request, tells why the IDEAL is the best silo you can buy.
THE DE LAVAL COMPANY, Ltd.

MONTREAL PETERBORO WINNIPEG VANCOUVER
50,000 Branches and Local Agencies the World Over

We quote prices as follows:

Finest creamery.....44½c to 45c
Fine creamery.....43½c to 44c
Finest dairy.....40c to 41c
Fine dairy.....38c to 39c

The receipts of cheese today were 2,157 boxes, as compared with 1,529 for the same day last week and 3,665 for the corresponding date a year ago. At Gould's Cold Storage today there were 800 boxes of cheese offered, which met with a good demand, and

all sold at 21¾c per lb., f.o.b., country points, as against 21½c to 21¾c last Friday. Apart from this, the market was rather quiet, with only a small trade passing, for domestic consumption in small cheese at 22½c to 23c per lb.

The Provision Market

There was no further change in the live hog situation today, but the tone of the market was firm at the recent advance in prices noted as receipts were very small, for which the demand from packers was good and sales of selected stock were made at $21.25 to $21.50 per 100 lbs. weighed off cars. The trade in dressed hogs was steady, but the demand at present is principally for small lots to meet immediate requirements and sales of abattoir fresh-killed stock in a wholesale jobbing way were made at $29.50 to $30 per 100 lbs.

The market for smoked and cured meats was without any new feature to note, prices for all lines being maintained, but the volume of business passing for local and country account is not large as the demand is only for small quantities. Sales of 8 to 10 lb. hams were made at 36c to 38c per lb., 12 to 15 lbs. at 34c to 35c, and heavier weights at 32c to 33c, while breakfast bacon sold at 40c to 42c, Windsor selected bacon at 43c and 44c, and Windsor boneless bacon at 45c. The condition of the market for barreled pork was unchanged, the trade being quiet and of a small jobbing character, with sales of Canadian clear fat back pork at $62, Canadian clear plate pork at $61, and Canadian short cut back pork at $59 per barrel.

There continues to be a steady demand for lard in a wholesale jobbing way and as supplies are none too large, the tone of the market is firm, with sales of pure leaf grades in a wholesale jobbing way at 31c to 31½c per lb. in 20-lb. wood pails and at 32½c to 33c per lb. in 1-lb. blocks, while compound lard is selling at 28c to 28½c in 20-lb. wood pails.

The receipts of provisions today were 225 barrels pork, 1,622 packages lard, 8 boxes hams and bacon, and 1,912 packages tinned meats.

The Local Flour Market

There was no important change in the flour market today. A steady trade continues to be done in rye flour and sales of broken lots were made at $17 per barrel in bags, delivered to the trade, while rice flour is selling at $9 per bag of 100 lbs., put up in 220-lb. sacks. The domestic trade in spring wheat flour is not large, as the demand is principally for small lots to meet immediate wants. Car lots of Government standard grade for shipment to country points were quoted at $10.95 per barrel, in bags, f.o.b. cars, Montreal, and to city bakers at $11.05, delivered. The tone of the market for winter wheat flour remains firm, owing to the small offerings from Ontario millers, and the fact that stocks on spot are not large, for which there is a steady demand, and sales of broken lots were made at $11.40 to $11.50 per barrel in bags, ex-store.

Millfeed and Rolled Oats

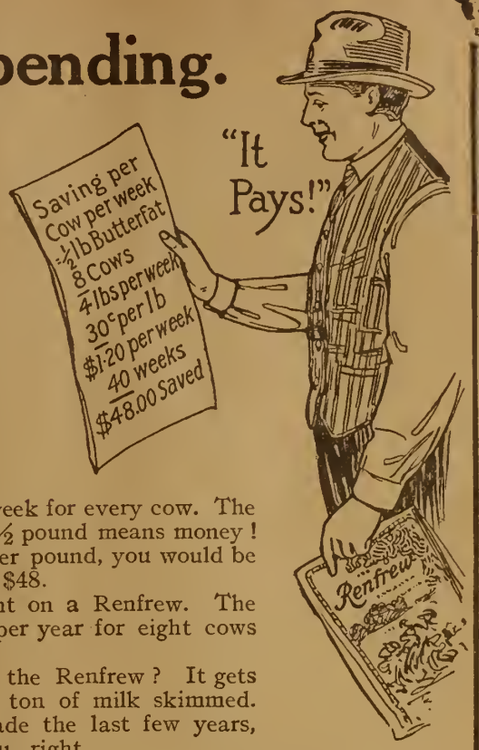
The market for millfeed was without any new feature to note. The demand for pure grain moullie continues ample to absorb all offerings and prices rule firm, with sales at $75 per ton, including bags. The trade in bran and shorts is quiet on account of the continued scarcity of supplies, and prices are unchanged at $35.40 for the former, and at $40.40 for the latter, per ton, including bags. There was no further change in the market for rolled oats, prices being about steady at the recent decline noted, with a small trade passing for domestic account in standard grades at $5.35 per bag of 90 lbs. in jute. The tone of the market for cornmeal is firm, with steady demand for small lots, and sales of Golden grade were made at $6.25 to $6.40, and bolted grade at $4.50 to $4.75 per bag, delivered to the trade.

The Baled Hay Market

The trade in baled hay was quieter today owing to the falling off in the demand for local account, and the fact that the Government are only taking from dealers the quantity called for as per contracts, consequently, as supplies are coming forward liberally they are somewhat in excess of requirements and the tone of the market on spot is soft, but there is no actual change in prices to note. Car lots of No. 2 hay are still selling at $17, and No. 3 hay at $15.50, but clover mixed hay is moving slow at $8 to $10 per ton ex-track.

Saving Money by Spending.

"SAVING" money by continuing to use an inferior machine is like "saving at the spigot and wasting at the bung." For instance, if your machine skims down to .1 per cent. for every thousand pounds of milk skimmed, compare that result with the splendid, proven record of the Renfrew. You find by having the

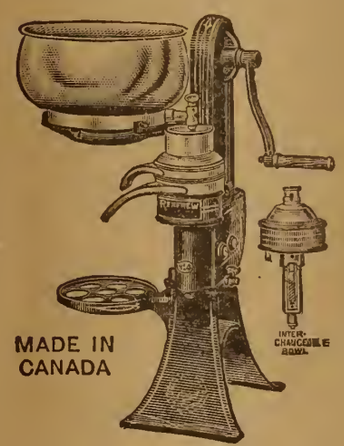


Renfrew

that you will save about ½ pound of butter-fat per week for every cow. The Renfrew skims down to .01 per cent. That loss of ½ pound means money! With eight cows, and butter-fat at say 30 cents per pound, you would be losing every year (40 weeks' milking) the tidy sum of $48.

This sum saved is accepted by us as a first payment on a Renfrew. The saving soon pays for the machine—and then the $48 per year for eight cows becomes extra profit.

Will it not pay you to discard the old machine for the Renfrew? It gets all but the last three ounces of butter-fat in a whole ton of milk skimmed. If you could reckon the losses the old machine made the last few years, wouldn't it decide you right away to get the close-skimming Renfrew?



Our illustrated booklet gives interesting proofs of the Renfrew's close skimming, including tests by Government Dairy Schools. It also explains the Renfrew's self-oiling system, the interchangeable capacity feature, easy-to-clean advantages, etc. Send for booklet to-day.

Other Lines: **Renfrew Kerosene Engine, Happy Farmer Tractors, Farmers' 2000 lb. Truck Scale.**

NOTICE.—The Renfrew Separator illustrated here was formerly sold under the name "Standard," which identified it as a high efficiency cream separator. The name "Renfrew" has been used on the same machine for several years for our United States and foreign trade and under that name has become as popular in those markets as under the name "Standard" in Canada. Now the name "Renfrew" has been adopted for Canada so as to link the name more closely with that of our company and so that we can sell the machine under a uniform name throughout the world.

MILK SHOULD BE PROMPTLY REMOVED FROM THE BARN

Warm milk at the time it is drawn from the cow readily absorbs from the air of the stable certain substances which impart to the milk disagreeable odors and tastes. When milk is allowed to stand in a poorly ventilated or unclean barn, the characteristic odor and taste of aromatic feeds such as beets, ensilage and turnips may be imparted to milk in the same manner. This may lead one to believe that the trouble is due to food which has been eaten, and that the odor and taste have been eliminated with the milk through the udder.

Ordinarily the condition can be corrected by the prompt removal of the milk as soon as drawn from each respective animal and placing it in the milk house where facilities for the proper and immediate cooling are available.

THE HORSE

THE HORSE'S COAT

The general appearance and comfort of a horse is greatly influenced by his coat. A well-groomed horse, like a well-groomed man or woman, is "pleasant to look upon." The coat of a horse to a great extent, gives evidence of care or neglect, as the case may be. While a nice, fine, silky, glossy coat adds much to the horse's general appearance, it requires a great deal of attention to keep it thus, especially during the late fall and winter months. Some horses have, naturally, much finer and shorter coats than others, and, while breeding has some influence in this respect, we frequently notice a vast difference in animals of the same breeding. Why this is we cannot determine, and are simply compelled to accept it as a fact. The age of the animal has an influence; we notice that it is not usually possible to keep the coat of a quite young or very old horse in as fine a condition as that of an animal between adulthood and old age. Horses under five or over twenty do not usually give the same returns for care and attention, as regards coat, as do those between these ages. In the former cases it may be that the more or less general fevered state of the system, consequent upon dentition, has an influence upon the coat, and in the latter case we probably are justified in assuming that the general vitality of the animal is more or less impaired, and the coat, as well as other parts of the body, evidence this decrease in vitality. We frequently hear people say that they "do not like grey or white horses, as they are so hard to keep clean." A grey horse is no harder to "keep clean" than a dark colored one, but dirt or stains show more readily, and it requires more attention to keep him "looking clean." We often notice, when a team consists of a grey and a dark-colored horse, and when care is taken to keep them looking well, that on close examination the grey has a finer, shorter and cleaner coat than his mate from the fact that stains, etc., show so plainly on him that he receives more grooming. During the summer months there is little trouble experienced in keeping a horse's coat looking nice, but as the weather becomes cold in the fall nature demands that the horse be clothed accordingly, and there is a strong tendency to growth of hair, and we may say that "the coat loses its gloss in proportion to the length of hair." In order, then, that we may retain the required gloss, we must take what measures we can to prevent this growth. In order to do this we must, in addition to regular grooming, avoid unnecessary exposure, and when exposure is necessary provide artificial protection when the animal is not in motion. As regards grooming, a horse should be thoroughly groomed twice daily; not merely the external surface of the coat brushed and rubbed, but the hair thoroughly agitated to the roots by working the comb or brush both with and against the grain of the hair, in order to remove dust, dandruff, etc., and thereby prevent any occlusion of the openings of the sweat glands and keep the coat free from dust. Whenever a horse has been ridden or driven or worked hard enough to cause perspiration, it would be well to rub him until dry. This is the manner in which race horses are treated, and a well-cared-for race horse certainly presents a fine coat. This practice, however, is not practicable in the average stable. It would require more help than the average horse owner could afford, or is willing to keep. The next best thing to do is to clothe him warmly, place him in a comfortable stall, excluded from drafts, and, when his blanket has become moist with perspiration, remove it and supply a dry one. When he has become thoroughly dry, a good grooming will remove the dried perspiration, free the matted hair, and remove all dirt and dust. Of course, horses must not be left out in the fields or paddocks at night, when the weather is liable to become cold, if we wish to preserve short coats. The advisability of wearing clothing in the stable is open to discussion, but if the stable be not quite comfortable we think that blankets should be worn, and even in warm stables light clothing should be worn as it tends to prevent dust entering the coat. In all cases in cold weather, when the animal is not in action, whether standing in the stable or standing outside in harness his body should be clothed sufficiently to protect him from cold and wind, and when it is necessary to work or drive a horse in a rain or snow storm, it is well to have him covered with a waterproof covering, in order to keep the skin dry and warm. Cold and dampness stimulate the growth of hair, in order to protect the skin, hence, when we are particular about the coat we must endeavor to avoid this stimulation. When horses are being used for slow work, not demanding sufficient exercise to cause perspiration, in very cold but dry weather, it is wise to wear blankets under the harness to protect the skin. In most cases, where reasonable care is exercised on the lines above mentioned, we will succeed in maintaining short, sleek coats on our horses, but there are exceptions. As stated "age has an influence," and there are certain individuals that from some unaccountabel reason or predisposition, will grow long coats, notwithstanding the most careful attention. In such cases the only method of preventing long coats is to clip. WHIP.

HORSES TROUBLED WITH WORMS DO NOT THRIVE

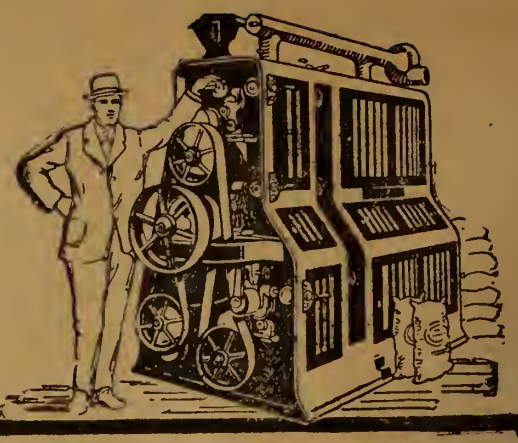
Many horses lose condition, or fail to make gains during winter months because they are infected with worms. This is especially true of colts. Horses suffering from worms generally have a good appetite, but apparently benefit little from the food eaten.

There may be no symptoms which point conclusively to worms, but this trouble is so common that if the colts and horses are not doing as well as they should for the feed given, a worm remedy may prove of decided value. In treating horses for worms, it is well to keep in mind that the drug is meant for the worm rather than the horse, and should, therefore, be given in as concentrated form as possible. To ensure this, little or no bulky food should be fed during the course of treatment, and as the parasites are stupefied by worm remedies rather than killed, the animal's bowels should be kept in an active condition so that the stupefied worms may be passed out before they regain their vitality. A well-salted bran mash once a day will generally ensure such an action.

The following formula is a worm remedy which is also of value as a tonic: Powdered nux vomica two ounces, powdered gentian root four ounces, powdered areca nut six ounces, sodium chloride four ounces, arsenious acid two drams; mix.

Give one heaping teaspoonful to every 250 pounds weight, every morning and evening for about 10 days. The medicine may be mixed with ground feed or sprinkled over oats which have been dampened.

June is a good months to start the work horses staying out on grass at night, but do not forget that horses at hard work require oats as well as grass.



Grind the Wheat Your Neighbors Grow

The production of wheat in your Province is increasing.

The country's grain supply will double in the next two years.

Make this your opportunity to become a flour miller. Operate a

Marvel Flour Mill

—the mill that gets all that's good out of the wheat—and serve your country and yourself.

Federal and local governments are urging and aiding the local milling of flour to help increase production, to conserve the supply, to avoid waste and to relieve shortage. Do your bit and make big profits.

The Marvel Mill makes a better barrel of flour cheaper. It mills any grade or any grain and meets government regulations. It is simple in construction and can be operated by anyone. Here is your chance to establish a profitable business for yourself and help your community.

If you have as little as $3000 to invest, you should get all the facts of this proposition at once.

THE IMPORTANCE OF ACTION IN HORSE BREEDING

An old friend of mine once, when he was told that a certain horse he was looking over was deficient in bone, replied tersely, "Action is power." The statement is so self-evident that one would think it needs no insistence. yet I am afraid that it is every day overlookel in favor of some point which, however important it may be, is of less mportiance to the practical utility of the horse. If we come to examine the uqestion carefully we shall find that the vale of the horse depends entirely upon his being capable of doing the work for which he is intended with the least expenditure of waste and with greatest amount of comfort and ease to the man who is working with him. In other words, the horse's value depends upon his capability to work on the lines of least resistance, and to form a fair estimate of that it is necessary carefully to examine a horse's action. This is not always done. even in the show ring, and I have seen men, both when purchasing and when judging, who seemed to make a point of never standing in front of or behind a horse. It should not seem necessary to insist on the necessity of getting in direct line with the horse whose action you are examining, but apparently it is.

When I was starting life an experienced "old hand" told me that I was to leave a horse which did not make a good impression when he first came out, and never look at him again. He said I would be sure to buy him if I did, and that he would never give me any satisfaction whilst I had him, and that when I came to sell him I should probably be so glad to see his back that I would sell him badly. The advice is thoroughly sound, as I found by by experience, though I would remind my readers that it is quite possible to be so fastidious when purchasing as to fall into the same difficulty. A man may get so tired of looking for the horse he wants that he buys a worse one than those he has previously rejected. I have known this to happeu more than once. But I think it is quite safe to urge on the would-be purchaser that he will be wise in shutting his eyes to all the perfections of a horse whose action, as a whole, makes a bad impression when he first is sent out. There may be exceptions —for instance, a horse may be upset when he first comes out either by the incompetence or bullying of the man who shows him, or by some outside circumstance. But even then, if carefully looked for, balance and actions will be found provided they the there.

One frequently hears such remarks as "His shoulders are all wrong but his action is perfect," or "He is perfect in shape but his action is deficient." Such remarks as these are contradictory. If a horse is perfectly shaped, if his joits are all in their proper place and in their proper working order, he must move well; he cannot do otherwise. And, per contra, if a horse is not truly shaped, he cannot move well and truly. It is an impossibility. He may move in a more or less showy manner, which in a certain sense pleases the eye, but his action cannot by any means be on the lines of least resistance. An important point is that the angle of the pasterns should be correct. However little it may be out of the correct line as the horse stands, it will be far enouogh out of it when he is extended, and a horse whose feet are thrown about, as we so frequently see when going at a good pace, is working at a disadvantagge, and when he is beginning to grow tired he is very apt to fall. If he is correct in this point he will stand up when many an apparently better horse will be in hopeless difficulties. I remember an instance in which this was strongly impresser upon me. I was riding a horse that was decidedly short of breeding. He was good looking enough, and his action was well balanced, but he lacked pace, yet the angle of his pasterns was perfect. It was my lot to ride this horse in two of the fastest runs I ever saw. One was forty minptes, the other forty-five. In the former I was one of some dozen, and I owed my position entirey to the correct pasterns and shoulders of my horse and his well-balanced action. There was in my way a stiff post and rail with a wide drain on the landing side. I rode slowly at the obstacle, a fairly big one under any circumstances, and sufficiently formidable on a beaten horse. My horse cleared it handsomely; it saved me more than half a field and got me an to good ground. But I am convinced that a heavy fall would have been the result had he thrown his feea about as some that I see in the show ring.

Many years ago the late Earl of Zetland—owner of Vottigeivo, Fandango, etc., impressed upon me the value of shoulder action. He pointed out that unless a horse put his foot well out, which he canot do unless his soulder is properly placed, the risk of his falling is great. He also said that we were likely to make the fatal mistake of taking high action for goood action. This we have done with a vengeance, and no one can examine carefully the action of the modern Hackney without recogni ing that much of the force expended is wasted in the air, and that high stepping iand well balanced acton are not convertible terms. Years ago the fatal mistake was made of ignoring the horse for the sake of the action. If a horse "pulled up," that is, if he hit his curb chain with his knee iit mattered nothing that he threw his feet all over the place, or whether he pu this feet more than half a dozen inches in front of hisnose. The result has been that Hackneys have, to a considerable extent, lost the good shoulders for which they were at one time famous, and that their action has also lost to a certain extent that balance which is the foundation of all good action.

The foundation of all action is the walk. It is a natural pace with all breeds of horses, and if a horse walks well, reaching out in front and getting his hind legs under him, and walking on at a good pace, he is pretty certain to move well in his other paces. Somehow the walk seems to have been much neglected of late years. If a horse is brought out for inspection everything is done to excite and upset him so that he shall not walk, and a similar state of things prevails in the show ring. In how amny cases when the judges say to an exhibitor, "Walk him donw and trot him back," is the him down and trot him back," is the It of course by no means follows that because a horse shuffles in his walk that he will trot badly or gallop badly. I have known and owned horses that trotted and galloped well and that were bad walkers, having neither style nor pace, but I hold that the walk is a valuable pace in a horse, and that if he is at all built on right lines he ought to walk well. The question therefore rises, has the horse's education in this direction been neglected for many generations until the bad habit bceome hereditary? It is possible. And I would point out that by "neglected education" I mean the teaching of those bad habits which are the result of indifferent horsemanship. Dalesman, in Farmer and Stockbreeder.

Hay-Field Economy

DEERING Mowers, Rakes and Tedders long ago became necessities in American farming. Year after year they have entered meadow and hayfield and made ready countless acres of hay for barn and stack. On thousands of farms each season, **Deering** mowers, rakes, and tedders do their work with satisfaction and little attention, and are put away until the next year.

When you buy a mower, rake, or tedder with the name **Deering** on it, you may be certain that it has every really good improvement ever made in hay machines. You may know that there is no skimping in any parts; there never was, in **International Harvester** machines.

Choose a **Deering** mower, rake, and tedder. Also—get acquainted with the new **International Combined Side-Delivery Rake and Tedder**, and with the **International Steel Windrow Loader.** These tools mean good, easy hay making, long service, and prompt repair service if you need it. WARNING: This is a year of big demand, scant supply, and handicapped shipping. Act early and be certain. Write to the nearest branch for folders.

POULTRY.

WHAT MAKES THE EGG

Experiments have shown that from 98 lbs. of food a hen can produce 30 lbs. of egg. The food must be given in the proper proportions in order to gain this efficiency. When too much of one requirement is fed, it goes to waste. When too little of one requirement is fed, the surplus of every other requirement is wasted. Common sense feeding may well be considered by the man who hopes to be a successful poultry farmer, in this day of high prices for feeds.

Then hen is the factory. We supply the materials and she does the manufacturing. In order to turn out the finished produce she needs a certain quantity of several things. She must have water, protein, fat and ash, and yet she is not particular as to how these substances are furnished, as long as she receives them. She will take the protein as corn or wheat, without refusing to furnish eggs, but with certain combinations she is more efficient than with others.

For example, if the 98 lb. of food is given her in the form of 30 lb. wheat, 10½ lb. middlings, 10 lb. bran, 5 lb. ground corn, 5 lb. meat scrap, 15 lb. green food, 3 lb. shell, 3 or 4 lb. grit, 3 lb. charcoal, 5 lb. oilmeal and the other four pounds of skim-milk, she will gain about the highest efficiency from the ration. If you would double the amount of wheat and leave all the other things the same, the extra wheat would be wasted. If, on the other hand, you would keep the protein-matter food less than required, you would be feeding a certain quantity of each of the other required items in the composition of the egg that would be wasted.

An egg is an egg, as far as composition is concerned. The hen will not give you an egg that contains no fat, simply because you offered her no fat, but double the amount of protein. She will simply take time off and wait until you give her the fat before she completes the finished product.

There are, of course, limits to the powers of feeding. No care in ration selection, no balancing according to the needs of the egg will cause every hen to lay. Some hens are born to lay, others are not, and will never be good layers. A laying hen is born, not made, but when you have laying hens, be sure they have opportunity to work efficiently.

Considered as a matter of feed economy, we should select the balanced ration, which means to give the proper amounts of the proper foods. In addition to the food that goes to make the eggs, a certain per cent. goes to the production of flesh, depending on the breed and individual. Then again, no amount of food will make a hen lay if housing conditions are bad, but we will disregard this by considering the proper food when conditions are right.

What would happen if we fed the hen on wheat alone? She would eat four ounces a day, for example. About one-tenth of an ounce o fwheat is protein. Of this amount about three-fourths would go to the upkeep of the body, although this varies with the breed. An egg contains one-quarter ounce of protein. The hen can only collect enough protein for one egg within several days. But the hen must have another quarter ounce of lime to make the shell of each egg. She must have a certain amount of fat.

She would get enough protein to make an egg about twice a day, provided all the protein was digested, enough lime to make an egg every two weeks, and enough carbohydrates to make three or four eggs every day, and make an egg that was half fat. If the hen would be the best she could the wheat ration would be all right, but she will not. She camps on the job until the lime arrives, and then she makes the egg. The waste of food goes on until you give her that lime.

MELVIN RYDER.

COST OF EGG-PRODUCING FEEDS

Feed to produce one dozen eggs cost 10c with pullets, 14c with two-year-old hens, and 19c with three-year-old hens in a three-year feeding test recently reported by poultrymen of the United States Department of Agriculture. These were the cost figures of feed at the time of the experiment, which began in 1912, and must be corrected to present prices. Tables of rations and costs presented in the report enable poultrymen to make these corrections when compared to 1917 prices. In Bulletin 561 of the Department of Agriculture, "Feed Cost of Egg Production", the specialists describe in detail this test, which was undertaken to compare the cost of various rations fed under general farm conditions. Much information relating to feeding under the various conditions also was learned in the experiment.

Starting with six pens of 30 pullets each, the test was enlarged to include 16 pens containing 366 fowls. Most of the pens were made up of 30 standard-bred pullets, bred and reared under the same conditions and selected for vigor, standard shape and color. Some flocks consisted of fowls of one breed, while others contained more than one kind of pure-bred fowls of the general-purpose type. Pens of cross-bred pullets also were used.

With the exception of three flocks which were confined to good-sized yards, all the fowls were allowed free range over several acres of rough land. Detailed records were kept of the feed used, the weight of the eggs. and careful observations were made of the conditions which affect egg production, such as molting and broodiness. The test was conducted on the experiment farm of the Bureau of Animal Industry, at Beltsville, Md. Summarizing the results of the tests, the specialists draw these conclusions:

The average egg yield for the first laying year in all pens was 131 eggs, and the highest pen average yield was 169.5 eggs. In the second year the average egg yield of all pens was 92.7 eggs, which decreased to 78.2 eggs in the third laying year.

The average value of eggs over feed cost the first laying year was $2.56 per hen, falling to $1.41 the second year, and to 79c the third year. The highest average value in any pen was $3.41.

The general-purpose fowls consumed annually 72 pounds of feed, which cost $1.13 while the Leghorns ate 55 pounds which cost 87c.

Good results were obtained with rations both with and without oats. The use of this grain added variety to the ration without increasing the cost.

Fowls not fed any beef scrap or other animal protein lai donly 90 eggs during their pullet year, compared with 137 eggs from the beef-scrap pens, and 84 compared with 83 in their second year. The eggs of the no beef scrap pens cost about 2.2c per dozen more to produce the first laying year, but these costs were about equal during the second year. The fowls not fed beef scrap laid very poorly in winter, thus materially reducing the value of their eggs.

Cottonseed meal used in place of beef scrap as a high-protein feed in the ration, produced brown or greenish spots on the yolks of the eggs, especially in warm weather, making a considerable proportion of them unfit for market. Eggs were produced more cheaply and at a considerably greater

NEPONSET ROOFS
NEPONSET PAROID ROOFING NEPONSET TWIN SHINGLES

THRIFT and production are the farmer's watchwords this year. *Paroid* is a tremendous help to the thrifty farmer, because the price is right, it is easy to lay, will require no repairs, and will last for many, many years. To date, Paroid has a record of over 19 years' service.

NEPONSET Paroid ROOFING

If you are roofing, or repairing roofs this year give your building the protection of Paroid. For instance, burning cinders falling on a Paroid roof die out harmlessly.

Paroid makes an attractive roof, too, either in the gray finish, or with the red or green crushed slate surface.

Insist on the genuine Paroid. Look for the label as shown here.

EASY FOR THE FARMER TO BUILD

Bishopric products protect the farmer against the higher cost of sheathing lumber, building papers and laths, save his time and reduce his labor expenses. He can apply it himself, in fact, if he so desires.

BISHOPRIC STUCCO BOARD

is made of heavy well-sized sulphide fibre board, surfaced on one side with toughened asphalt mastic, reinforced with No. 1 kiln-dried lath.

It comes in sheets 4' wide and 4' to 10' long ready to be applied direct to the studding. As a background for plaster, there's nothing to equal Bishopric Stucco Board as it eliminates sheathing lumber, building paper, etc., and cuts the cost in half. Less plaster is required too, as it is impossible for plaster to fall down between the studs as when put on over ordinary lath.

BISHOPRIC STUCCO BOARD

for stables, poultry houses and grain bins costs less than lumber and makes a warmer building—dry, rat and vermin proof.

Our Bishopric Book gives facts about this better and more economical way of building on the farm. It would interest you. Mailed free on request.

BISHOPRIC WALL BOARD CO.
LIMITED 91
529R Bank Street, Ottawa, Ont.
Manufacturers also of 'Permatite' and Farmers' Special Roofings.

profit on the beef-scrap ration.

Fish meal at $7 a ton less than beef scrap proved to be a good high-protein feed, which can be used to advantage to replace beef scrap. The fish meal did not in any way affect the flavor or quality of the eggs.

General-purpose fowls allowed to select their own mash constituents ate a dry mash containing about 63% corn meal, 19% beef scrap, 9% bran, and 9% middlings. Leghorns ate a mash of about 66% corn meal, 26% beef scrap, and 4% each of bran and middlings. No better results were obtained by this method of feeding than where the ground grains were mixed together in a mash.

Good mashes, as indicated by these experiments, may be made of 66% corn meal, 26% beef scrap, and 4% each of bran and middlings, or 2 pounds of corn meal and 1 pound each of bran, middlings and beef scrap, with a scratch feed in each ration of equal parts by weight of cracked corn, wheat and oats, which is fed so that the hens receive about equal parts of scratch feed and of mash.

The Leghorns on free range gave a considerably greater egg yield than those confined to a fair-sized yard. This difference was less marked in the general-purpose hens.

Sprouted oats fed as green feed to hens confined to yards cost about 10c per hen a year and $1 per dozen eggs, not including any charges for labor and equipment. The hens ate on an average in one year about 1.3 pounds of oyster shell and 0.7 of a pound of grit, which together cost about 1c per hen.

The Leghorns did not lay as well in the winter as the general-purpose breeds, especially during their second year, but the Leghorns produced eggs about 3c per dozen cheaper during their first year, 6.4c cheaper in their second year, and 9.8c cheaper in their third year, than the general-purpose breeds. One pen of Leghorn pullets produced eggs in their first year at a feed cost of 6.7c per dozen, while the value of the eggs per hen for the year was $3.41 over cost of feed.

The average weight of a dozen eggs from the general-purpose fowls during their pullet year was 1.53 pounds, 1.60 during their second year, and 1.63 during their third laying year. The eggs from the Leghorns averaged 1.45 pounds during their pullet year, and 1.49 during their second and third years.

The egg production of the general-purpose fowls decreased 32% in their second laying year. The decrease was considerably less in the Leghorns, their two-year average egg production exceeding that of the general-purpose breeds by 19 eggs. The decrease in production from the second to the third year was only 4% with the Leghorns, compared with 13% in the general-purpose breeds.

The cheapest eggs are produced in the spring, during April, May and June, while the greatest costs occur in October, November and December. The lowest monthly feed cost of a dozen eggs in any of these experiments was 4c, while in some cases no egs at all were produced during the month.

MAKE THE HEN WORK WHILE SHE IS YOUNG

The pullet year is the most profitable part of the fowl's life. Only the exceptional hens can be kept throuhg a second winter at a profit unless they have additional value as breeders. Hens on the farm now over two years old should be consumed at home or sold. If the farmer doubts his ability to distinguish a hen's age, he can put one hog ring on the right leg of each bird as she ends her pullet year. This is inexpensive, and easy of identification.

If feed is scarce as well as expensive, then it will pay to sell all the young roosters that won't make money, and all the stunted, undersized and slow-growing pullets. Anything that will not lay or grow profitably should be sold, leaving their feed for poultry that is more profitable.

The females that have just finished their first year should be sold as soon as they quit laying, unless for some reason or other a few must be kept as next year's breeders. If October 1 be the date for culling, 95 per cent. of the birds that had been poor layers would be pretty well moulted and show the yellow color in beak and shanks. The good layer would either not have started moulting or would be ragged, but in good, vigorous condition, with all her beak, shank and skin color "laid out" and absent. The early moulter, was the poor layer, and will seldom get back into laying before the late moulter, and then not until near-Christmas time. The late moulter was the heavy layer, and is the kind to use for breeding. H.

TO ERADICATE POULTRY PARASITES

The first step to eradicate the pests which live in cracks and crevices in poultry houses is to thoroughly clean the house. All litter, nest material and droppings should be removed. Then spray or paint thoroughly the entire surface of the house and literal ly flood all cracks and inside of nests with a 5 per cent. solution of cresol. Use plenty of spray and do the work thoroughly.

Finally it should be remembered that one application of either of these treatments is not sufficient. Where there are lice and mites there are also eggs or "nitts" of these same pests. A second treatment should be given about one week after the first. By this time the "nits" will be hatched and the treatment will affect them while it did not kill the "nits" at the first application.

These suggestions followed out will relieve the hen of the greater numer of parasites and will enable her to make the best possible use of her feed and time. It is not profitable to feed a hen when lice or mites are sapping all the nourishment and vitality from her body.—P. F. Schowengerdt, Colorado Agricultural College, Fort Collins, Colorado.

BILLY'S ORGY

By Grace S. Richmond

(Continued from last issue)

"I say—but you cut a dash in those togs old man. Never saw a white waistcoat and a bath-robe together before. Awfully novel and stunning effect."

"Mr. Broughton, don't let them make fun of you. I think it's just lovely of you to be taking care of your little nephew like this."

Julius bowed appreciatively to the Chicago cousin of the Meredith girls.

"You're all right, Julius," said Sally Meredith.

"Oh, but somebody ought to take a flashlight of him, with Billy on his arm like that." This from the half-back of the class eleven.

"Look at the kid's face! Better put on his bib next time, nurse." It was the captain of the class crew.

"Give Billy to me," whispered Sally Meredith in Julius' ear—"then you can run up and put on—something else."

Julius thankfully gave Billy into Sally's arms and made for the stairway, saying something or other about coming back in a mainute, but three stalwart members of Yale crews and football teams fell upon him and prevented this.

"No, you don't," they shouted. "It's a lot more of a treat to have our host dressed like this than according to his own ideas of what's what. Come back—you couldn't wear a more becoming thing than that blue and gray trailer."

Julius sat down resignedly on the bottom stair. "Have it as you like," he said calmly. "You can guy all you see fit, but it's up to you to get that kid back to sleep before his fond parents return. They're likely to come in any minute now."

"I'll go up and get him to sleep," said Sally Meredith. Julius gave her a grateful glance. Sally was looking excessively pretty tonight. The walk in the storm and the additional exercise Billy was giving her had brought a rich color into her face, above which a white Tam o'Shanter set upon masses of black hair brought out a general vividness of colring most attractive.

But the grateful look on Julius' face gave way to a harassed expression as his friends protested.

"Not much; she don't go up and put the kid to bed. He's good fun—aren't you, Billy Elliot? Look at his curls bob! He's having a rattling good time."

"Oh, let her take him up," proposed the stroke of the 'Varsity crew. "We'll go too, and see that she's properly coached—she's a green hand."

While various propositions relating to the baby's entertainment were being made Sally Meredith attempted to steal away upstairs, but she was discovered and the crowd followed. Julius was allowed to bring up the rear. They were held at bay at the door of the nursery by Sally.

"You may just stay out there," she commanded. "And you must be perfectly quiet. Just imagine what Mrs. Jack will say if she comes in and finds us like this."

"She won't come in," promised the half-back. "If their train gets through at all it'll be hours late. Everything's tied up in this storm. Wayne Griffin was coming out on the nine-fifteen and he didn't come—couldn't get here."

Sally turned down the nursery lights, found a rocking chair, and sat down in it with Billy in her arms. She began to sing softly. But Billy was uncompromisingly wide awake. He persisted in sitting absolutely erect in Miss Meredith's lap, his head cocked toward the door, outside which sat a circle of people on the floor, precisely as Julius had suggested arranging Mrs. Jack's servants and their attendants earlier in the evening. A hum of talk and much imperfectly suppressed laughter kept Billy agog with excitement.

"Julius, you will have to come and try," Sally called at length. The guests demurred, but Julius evaded them and went around and entered the nursery by another door.

"You are an angel," he murmured in Sally's ear, as he bent over the two, in his bathrobe.

"I know it," she answered. "It's because I'm so delighted with you for staying by the baby."

"Oh, yes, I stayed by him," Julius agreed modestly. "Anybody would. He's not so easy to get away from. And neither are you."

"Now, I wonder what you mean by that," whispered Sally Meredith, looking up at him with laughter in her eyes. Julius' hair was in a fine disorder, his collarless neck showed his strength of build, and his eyes were brilliant. It was entirely reprehensible, the thing he did at this point, but in ihs present attire he could hardly be called entirely responsible. As he bent over his nephew, patting his curly head and, in the dim light, presenting the appearance from the doorway of being engaged wholly in assisting Miss Meredith to soothe the wakeful baby, he suddenly laid a pair of warm lips on hers, whispering: "Forgive me—but you're irresistible tonight."

"Let's sing him a lullaby." suggested the Meredith's cousin from Chicago. She softly started a song, and everybody joined in. Billy, sitting in Sally's lap, his uncle, kneeling ly his side, patting his head; Sally, with her black hair drooping until it mingled with Billy's yellow curls, listened to a charming melody set to the usual idiotic words of popular songs, intermingled with occasional sibilations of stifled merriment:

" 'Come, Sus, lub me, do,
Same as I lub you.
Come, Mis', one kiss;
Don' yer see I lub yer true?
Sweet prize, ope' dem eyes,
'Fore I says adoo;
Gib me one smile,
Ma honey chile,
Ma Susquehanna Sue.' "

They sang this over and over, more and more slowly, more and more softly, impressed with their own prowess in lulling a child to sleep for the first time in their lives. Inside the nursery Billy, with sparkling eyes, watched his uncle's hand make a complicated circuit indefinitely repeated. tI passed over his head, down by his ear, fell inta his lap, where a smaller hand held Billy's, moved slowly and caressingly across this hand, sometimes stopping a moment, then going on up to the top of the baby's head, across his curls, off down over his ear—and so around. It was most absorbing.

The rattle of a latchkey sounded in the door below. Nobody heard it. In the lower hall Mr. and Mrs. Jack Elliot paused for one breathless instant, then one flew, and the other leaped up the stairs.

"Gib me one smile,
Ma honey—"

"Great heavens!" burst from Jack, standing aghast before the group on the floor, outside the nursery door. Mrs. Jack stopped for no preliminary questionings; she made one frantic rush into the nursery, breathing the anxious word: "Billy!"

Her brother Julius glanced at her with a dazed expression. Sally Meredith smiled reassuringly. Billy looked up from his uncle's hand, which was at that moment just moving lingeringly up towards his curls again, and leaped on Sally's lap and crowed.

"Well, we must be going, thank you," said the stroke-oar tactfully. "Oh, don't mention it, Mrs. Elliot. Always a pleasure to stand by a classmate in distress. Yale men are famous for that, you know. The old boy was behaving gallantly, but he was getting worsted in the fight, and we just saw the situation and rallied around him. A few moments more and I'm sure we should have had your son asleep. Good night—you were mighty lucky to get back in this storm. Good night, Mr. Elliot."

When Julius slipped softly into the house a half hour later, after taking Miss Meredith home, he found himself instantly confronted by his sister, who, at the moment, was coming down the stairs. Jack was lounging in front of the hall fireplace, thawing out.

"Ugh—fierce night," observed Julius, getting out of his overcoat and observing his sister's expression out of the corner of his eye. "You sure were lucky to get back at all. Going to make a night of it? It's twelve-thirty now."

"Julius," began Mrs. Jack sternly, "did Billy have a colic?"

"I think not—yet," replied her brother cheerfully, warming his hands before the fire.

"Where is Mary?"

"Don't ask me."

"You don't mean she isn't here?"

"I haven't been able to discern her presence," said Julius calmly.

"Isn't cook in?" She knows how to look after Billy—she's very fond of him. Why didn't you call her if Billy had a colic?"

"Billy didn't have the colic, I tell you," reasserted Julius, with irritation. "He just simply woke up. I was telling some of your servants—I wanted to go out. The Meredith girls sent for me," he exclaimed in an injured tone, "and I got all dressed to go——"

"You look it," observed Jack with his eyes on Julius' apparel. "Nice dressy front you have on there. Just as well you couldn't go, I should say. You were a touching spectacle in your bath-robe with that waistcoat."

Julius glanced hastily down. He had replaced the bath-robe with a house-coat before going out, which now, falling widely open, exposed to view a white waistcoat with a dark jam-colored imprint of five small fingers, like a

coat-of-arms or a decoration of honor.

"Oh—er—" began Julius; but Mrs. Jack was looking at him suspiciously.

"Billy's nightgown was covered with something strange," she said, reproachfully. "And when I came down to get him some milk I saw the dining-room table. Julius, what did you give him?"

"Oh, nothing much," said Julius, with attempted nonchalance, which caused him to look particularly guilty. "I got hungry myself, that's all."

"Julius, tell me instantly what Billy has had to eat. Did you give him bread and jelly—at this time of night?"

"It was a—er—sort of bread and jelly," admitted Julius, making for the stairs. "Good night—I guess I'll go to bed, if it's all the same to you."

"Julius Broughton—was it bread and jelly? And, Julius—don't you think it was a very strange-looking thing for you to be kneeling on the nursery floor in a bath-robe, at Sally Meredith's feet—in the dark?"

"Oh, good night, good night," called back the Yale sophomore, disappearing around the turn at the landing.

LESSON 7

DINNERS USING MEAT SUBSTITUTES

Vegetable Roast
Potatoes Hot Slaw
Date Pudding
Nut Loaf
Beets Potatoes
Carrot Pudding
Salmon and Rice
Peas Squash
Bran Gems
Suet Pudding Tea
Bran Gems

1 c. bran, 1 c. white flour, ¼ c. sugar 1 tsp. salt, 4 tsp. B. P., 1 c. milk, 1 egg, 1 tbsp. butter.

Mix and sift flour, B. P. and salt, add sugar, milk, egg well beaten and melted shortening. Bake in muffin tins.

Suet Pudding

1 c. chopped suet, 1 c. milk, 1 c. molasses, raisins if desired, 3 c. flour, 1 tsp. soda, ½ tsp. cloves, cinnamon, ginger and nutmeg.

Mix and sift dry ingredients, add suet and fruit; mix well and add milk and molasses mixed. Turn into greased mould, cover tightly and steam 3 hrs.

Vegetable Roast

1 c. cold boiled beans, 2 c. bread or cracker crumbs, ¼ c. melted butter, pepper, sage, 1½ c. milk, 2 c. mashed potatoes, salt, 1 egg, onion.

Mix beans, crumbs, milk and potatoes and put through meat grinder, add butter and egg, seasonings. Shape and bake.

Hot Slaw.

Shred 2 qts. cabbage, add 2 tbsp. butter, 2 tsp. salt, pepper, 2 tbsp. vinegar and 1 c. water. Simmer about 1 hr. Serve.

Date Pudding.

Melt ¼ c. butter, add ½ c. molasses, ½ c. milk and 1 egg well beaten, then add 1½ c. graham flour mixed and sifted with 1 tsp. salt and ½ tsp. soda, add 1 c. dates stoned and cut in pieces. Turn into buttered mould and steam 2 hours. Serve with Sterling Sauce.

Sterling Sauce

Work 1/3 c. butter until very creamy, using a small wooden spoon, add very gradually 1 c. powdered sugar. Add 1 tbsp. rich milk or cream, and flavor with 1/3 tsp. lemon extract and 2/3 tsp. vanilla. Garnish with cherries.

Nut Loaf

1 c. chopped nut meats, 1 c. bread crumbs, 1 hard cooked egg, chopped, 1 c. boiled rice, slice of onion, salt.

Mix with one raw egg, shape in loaf. Baste with butter and water and bake in moderate oven.

Beets a la Poitevine.

Boil beets until tender, remove skins and cut the beets in slices. For a pint of beet slices, chop one medium onion and fry in 4 tbsp. butter, add 4 tbsp. flour, ½ tsp. salt. Add 2 c. white broth and bring to boil, let simmer a min. Add sliced beets with salt and pepper as needed and again let simmer 5 min. Finish with 1 tbsp. vinegar, and 1 tbsp. butter. Serve very hot.

Carrot Pudding

1 c. flour, 2/2 tsp. soda, ¼ tsp. salt, ½ c. finely chopped suet, ½ c. raisins, chopped, ½ c. currants, 2/3 c. sugar,

The ENTERPRISE Perfect Double High Oven Range

Made by
THE ENTERPRISE FOUNDRY CO.
Sackville, N.B.

¾ c. grated potato, ½ c. grated carrot. Mix and sift dry ingredients, add suet and fruit; mix well. Add vegetables and stir until well blended. Steam 2½ hours.

Salmon and Rice

Form freshly boiled rice into flat cakes, brown slightly in fat, on both sides. Place on a warm platter. Warm salmon and spread on rice. Over this pour a white sauce into which have been stirred the whites of two hard cooked eggs, cut in dice. Garnish with yolks.

Steamed Squash

Wash, cut and pare squash and steam until tender. Season with butter, pepper and salt. Mash.

OUR UPSTANDINGS AND DOWN-SITTINGS

To be caught seated at a social occasion when we should be on our feet makes us as uncomfortable as a stranger in an Episcopal church. Every one but our embarrassed selves seems to know when to get up and when to sit down, and we agree miserably with the prayer-book that "we have done those things which we ought not to have done, and left undone those things which we ought to have done."

Such discomfort is needless, for the rules about rising—which, after all, are no more than the custom of well-mannered people—are few, simple, and founded upon courtesy and common sense.

First, there is the question of introduction. A lady should always rise when presented to another lady, unless the latter is much younger, in which case it is quite permissible to keep one's seat and simply bow one's acknowledgment.

When a woman is seated and a man is introduced, she does not rise, unless he is a very distinguished person or a gentleman many years older than herself, to whom she wishes to show deference.

It is not usual to shake hands with a person whom one meets for the first time, except as a mark of unusual cordiality. A hostess, however, should always extend a welcoming hand to her guests, both to those with whom she is already acquainted and to any stranger brought to her home by a mutual friend.

In greeting, she holds the hand palm upward; in bidding farewell, with palm down. On the face of it, this custom may seem an absurdity, but like all rules of good form, it is based upon common sense, for when a guest knows in just what position the hostess will extend her hand, there is no awkward fumbling about before the hands are clasped in greeting or farewell.

At an afternoon affair, when the hostess is pouring tea from behind her tea-table, rising to greet each guest is too awkward to be in good form. In this case, she simply bows, giving her hand if she likes. She also bows her adieux, should a guest leave before the tea-pouring is over.

A man caller should always rise when another guest enters, whether the second arrival be a man or a woman. He should remain standing until a lady has taken her seat, in observance of the rule that a man never remains seated when a woman is standing. This is a courtesy in which no man should grow careless; the act is slight enough in itself, but women appreciate and expect this deference.

A woman is not expected to rise when a later arrival enters, except in the case of a very young girl and a much older woman, when the former does it as a mark of respect. The hostess, however, should always rise to greet her guests, for it is her duty to make them feel welcome and at ease in her home.

When guests rise to go, the hostess rises also, and remains standing until they have taken their departure. And here, let me speak a word about prolonged good-bys.

To keep a hostess standing longer than the few minutes needed to say one's good-bys is one of the most thoughtless discourtesies a guest can commit. Yet how few of us could plead "not guilty" to the charge!

Time and again, guests will rise with an "I must go," which brings the courteous hostess to her feet; then they proceed to pay a second call, while the other guests wait and the hostess tries to conceal her discomfort.

Sometimes the hostess follows her guests to the door, and her courtesy is rewarded by ten minutes of shivering in the cold, while the warmly wrapped guests finish up their visit.

When we go let us go, and have no more last-minute conversations, which leave our hostess with an after taste of weariness and boredom.

At a dinner-party, the hostess, of course, leads the way to the dining-room immediately after dinner has been announced by the maid.

Each man assists his partner into her chair, then remains standing until all the ladies are seated. Should a guest arrive late (though this is considered almost inexcusable at even a semi-formal dinner) the men should rise until the guest is seated.

At the end of the dinner, after the hostess has given the signal to rise, the men remain standing until the ladies have passed out. Then they may either sit about the table with the host for a short time, or follow the ladies into the drawing-room.

Awkward situations sometimes arise when acquaintances meet in a restaurant or hotel dining-room. If a man is dining alone and a lady bows to him, he should simply bow and rise slightly in acknowledgment.

If he is with a party, and a lady and her escort stop to speak to him or his friends, he rises and remains standing until she has passed on. He should also rise if a woman is introduced.

It is courteous for a man to acknowl-

Back Ache!

NATURE gives warning of approaching disaster, and backache tells you that the kidneys are deranged.

As soon as the kidneys fail poisons are left in the blood, which cause aches and pains, rheumatism and lumbago.

The digestive system is interfered with, and there is gradual loss of flesh and harshness and dryness of the skin. There is often headache and dropsical swelling of the limbs.

The most effective treatment is that which awakens the action of the liver and bowels, as well as the kidneys, for these organs work together in removing the poisonous impurities from the system.

This is the reason why Dr. Chase's Kidney-Liver Pills are so successful in the treatment of diseases of the kidneys. This is why they frequently cure when ordinary kidney medicines fail.

Just put this medicine to the test when you have backache, headache and other indications that these filtering and eliminating organs are sluggish in action, and see how quickly they will respond.

Prevention is always the wiser course. For this reason it is well to keep Dr. Chase's Kidney-Liver Pills at hand, and by regulating these organs forestall serious disease.

Dr. Chase's Kidney-Liver Pills

One pill a dose, 25 cents a box, all dealers, or Edmanson, Bates & Co., Ltd., Toronto. Do not be talked into accepting a substitute. Imitations only disappoint. 7

KIDNEYS SO BAD WOULD FAINT AWAY

THAT WAY FOR TWO YEARS.

Those who have never been troubled with kidney trouble do not know the suffering and misery which those afflicted undergo.

The dull pains, sharp pains, and quick twinges, all point to the fact that the kidneys require attention.

Doan's Kidney Pills are a specific for all kidney troubles.

Mrs. Albert Williams, Edam, Sask., writes:—"I have the greatest pleasure in telling you what Doan's Kidney Pills did for me. Ten years ago I was so bad with my kidneys that I would faint away, and could not stand to do anything. I had been that way for two years, and had done all I could, but did not get any better until one day some one put a little book in our door, and I saw how another young girl had suffered like I was then, so I thought I would try them, and I am glad to say that after taking four boxes I have never had the same thing again. Thanks to "Doan's."

When asking for "Doan's Pills" see that you get the oblong grey box with the trade mark of a "Maple Leaf." Price 50c; put up by The T. Milburn Co., Limited, Toronto, Ont.

Advertise in the MARITIME FARMER

edge an introduction to another man by rising, but this rule is often waived by men, who are less formal in their relations with one another than woman.

One last word about our children's manners. Nothing so stamps a mother with good taste and refinement as a well-mannered child. Teach your child to rise when he is introduced to an older person, to extend his hand and say distinctly, "I am glad to meet you," or some other polite formula, instead of hanging back and mumbling a few embarrassed words; and when he reaches the awkward, hobbledehoy age, the habit of years will save him many a painful moment.

Teach your boy to rise when ladies enter the room, to remain standing at the table until they are seated, and all the small courtesies which are only quaint and pleasing in a small boy, but by which his good breeding will be judged when he is a man.

CORSETS—HOW TO WEAR THEM

This is how the average woman decides the most important question in dress. She walks into a department store, finds the corset section, and says: "Give me a pair of corsets, twenty-two. Something at about two dollars." Then she takes home what the girl chooses to give her.

You put these corsets on. Nine times out of ten, you grumble at the lacing of them, and, of course, do it in the quickest way. For a day or so you feel uncomfortable, and you look better than you did. But in a week those poor corsets haven't a bit of life left, and you look it. In a month they are hopeless and you know it, but it isn't time to buy a new pair, and so you join the procession of women who do not look their best. In the course of time you cease to care—think perhaps it is your age and let it go at that.

Now the trouble is, in the first place, that you didn't have enough interest to look over the stock. Department stores carry very large stocks of corsets these days, and you wouldn't take the time to interest the girl, who knows a great deal about corsets and your special needs. She it is who could and would help you to find just the right corsets for you.

Then, after getting your corsets, you just put them on and wore them until it was time for a new pair, never heeding the symptoms: a pull here, a drag there; the general uncomfortableness that should tell you that you have on the wrong corset. At night you took your corsets off, threw them across the back of a chair. (Hundreds of women still do this.) And then youwent to sleep, happy to have the uncomfortable things off at last.

If you would have your figure what it ought to be, you should give it the time and the careful attention which you give to your housekeeping.

First, try to find the corset that fits you now—not the one that fitted you a year or more ago. Corsets change a little every year, but the improperly corseted figure changes a great deal in a very little while. Remember, too, that after years of inattention it takes quite a while to produce a really good figure, even with the best corset. Little by little, however, you will see a change for the better. Your corsets will last longer, look fresher and, incidentally, so will you.

The following directions for lacing and adjusting corsets were given by a corset-fitter in a large department store.

"To attain absolute comfort and the necessary foundation for properly wearing one's clothes, the corset must be properly laced and adjusted.

"Use a ten or twelve yard lacer, and, beginning at the top, lace to within two holes of the waistline. At this point, pass the lacer through the second hole and return it through the top hole on the same side, thus forming the loops at the waistline and causing the lacers to cross and hold the flesh in place. Then continue lacing the corset in the usual way.

"It must be remembered that in crossing the lacer to make these loops, it is necessary to pull the top lacer to draw in the lower part of the corset, and vice versa.

"To adjust the corset properly, unlace until the back steels are far apart, hook from the bottom up and adjust the garters, being very careful to have them perfectly perpendicular so that the material may not be pulled to the

The Simple "Why" of Pathe Superiority

SOME articles achieve fame by their intrinsic merit as viewed by the public. Others by the puff and blow of their producers. The Pathephone success is as simple as it is sure. It is due to its being an improvement upon anything which has come before it or since.

The original Pathe' Freres took the old-time talking machine and developed it until it is now the supreme achievement. Note these improvements: Instead of the old, scratchy, ever-changing steel needles—a genuine polished sapphire ball. Instead of a metal sound chamber—an all-wood one (on the violin principle). Instead of recording in narrow sound waves—a unique Pathe' method with long broad sound waves, more contact, more tone, richer music. Instead of "varnished boxes"—handsome cabinets—in historic period designs. Instead of playing only one or two kinds of records—the Pathephone will play all makes of records.

HAD WORST CASE OF CONSTIPATION

DOCTOR EVER KNEW.

Although generally described as a disease, constipation can never exist unless some of the organs are deranged, which is generally found to be the liver. It consists of an inability to regularly evacuate the bowels, and as a regular action of the bowels is absolutely essential to general health, the least irregularity should never be neglected.

Milburn's Laxa-Liver Pills have no equal for relieving and curing constipation and all its allied troubles.

Mrs. F. Martin, Prince Albert, Sask., writes:—"I had one of the worst cases of constipation my doctor said he had ever known, and Milburn's Laxa-Liver Pills cured me of it. My father-in-law had used them, in fact he was the one who gave them to me. A number of people around here use them, and they all say that they are the best pills they ever used."

Milburn's Laxa-Liver Pills are 25c. a vial at all dealers or mailed direct on receipt of price by The T... Limited, Toronto.

right or left.

"Then hook or lace the material below the front steel, and pull the corset well down on the figure, especially in the back, so that the waistline of the corset is exactly where it is intended to be worn.

"Now, draw the loops at the waistline to "set" the corset, being careful to pull down on the loops, and not up. Tie the loops temporarily in front and then draw the hip loops to the proper tightness, tie and slip them under the lacer and back of the corset. Then readjust the loops at the waistline, tie and slip them under the front steel at the top.

"If the garters are not sufficiently tight they should now be readjusted, and when the buckles are set properly, do not change them unless shorter or longer hose are worn. Side and back garters should be slightly looser, as the slack is required for sitting.

"By looking in a mirror when adjusting a corset, it is quite easy to draw the lacers so that the back is perfectly flat, which is the present requirement.

"In removing a corset it should be unlaced. In this way it is ready for the next wearing."

After the corset is unlaced, it should be rolled back carefully, inside out. This, I am told, adds much to the life of a corset.

Of course, you would omit this if your corset were even slightly damp, as it might be on a hot day. In that case, it should be spread out to dry and air.

If it is at all possible, a woman should have two pairs of corsets; one to wear one day and one for the next. Two pairs bought at once and used in this way will give you better service than a pair bought now and then, as actually needed.

By GERTRUDE VIVIAN

Did a Good Turn For an Old Friend

HOW TWO MEN PROVED THE WORTH OF DODD'S KIDNEY PILLS

Henry Burkhart, of Saskatchewan, Sent Dodd's Kidney Pills to Dakota, and His Friend Joins in Their Praises.

Fox Valley, Sask., May 4th, (Special)—"I tell every one that suffers from kidney trouble to take Dodd's Kidney Pills." These are the words of Mr. Henry Burkhart, of this place.

"I took Dodd's Kidney Pills for eight months" Mr. Burkhart continued, "and now I feel as well as ever I did in my life. I also sent one box to a friend who lives in Dakota, and who I knew suffered from his kidneys.

"My friend wrote me to get him some more of Dodd's Kidney Pills, as the doctors could do nothing to help him. He said Dodd's Kidney Pills were the best medicine he had ever taken.

"I would not be without Dodd's Kidney Pills."

In the sparsely-settled parts of the West, where doctors are few, Dodd's Kidney Pills have long held an honored place in the family medicine chest. The conditions which are common to newly-settled prairie countries makes kidney trouble one of the most prevalent ills, and the settlers early discovered the splendid results to be obtained from Dodd's Kidney Pills. Ask your neighbor about them.

LONG LIFE TO YOUR TAILORED SUIT

"This is the third year for that suit of Cecil's," said a cousin to me last year, as I commented on her husband's good-looking clothes. "You want to know how he manages to keep it like new? I have washed it several times in a solution my brothers and uncles have used for years.

"This is the formula:

"Shave half a cake of good white soap into two quarts of boiling water and add two heaping tablespoonfuls of borax. Set on the back of the stove until dissolved and add it to two gallons of tepid water.

"After washing in this solution, I hang the clothes on the line, with the coat on a hanger and the trousers carefully pulled into shape. When almost dry they are pressed. With the aid of a sleeve-board, that is not so hard as it sounds."

The mother of small boys will appreciate this way of keeping them looking fresh and clean. Women's suits may be treated successfully in the same way.

White serge suits are so pretty for spring and summer wear, especially for young girls, yet mothers sometimes hesitate to get them, because they eat up almost their original cost in cleaner's bills.

A white serge suit can be kept in good condition a whole season simply by getting a ten-cent cake of magnesia. After brushing the suit, rub the magnesia on all soiled places, until the fiber of the cloth is full. Leave it there until the suit is to be worn again, when the magnesia should be shaken or brushed out.

Prepared chalk is almost as good as magnesia. It is better to give your suit this little care each time it is worn than to have to send it to the cleaner often.

The neck of a blouse or the white collar on a serge dress may be kept clean by rubbing a little prepared chalk on the soiled places when the garment is removed.

Leave this on until the blouse or dress is to be worn again, then brush it off and the spots will have gone.

DON'T THROW AWAY POULTRY FAT

Don't throw away the body fat of poultry, advise home economic experts of the Department of Agriculture. In so doing you are wasting fat which French housewives consider excellent for making cakes and puff paste. So great is the demand for this fat in New York and other large cities at certain times in the year, that it brings as high as $1.10 per pound, and many people make a business of collecting it from butchers and others who dress poultry.

To prepare poultry fat, dry it out in a double-boiler until the fat just melts away from th etissues and can be poured off. Then keep it cool and covered, like butter. Chicken fat, like goose fat, may be used for shortening in cakes which are highly seasoned or spiced; it may further be used for frying the chicken itself, and in the preparation of many other meats and vegetables for the table.

You will enjoy cooking that big meal on this family size oil stove. Everything so convenient. Each burner controllable to any desired heat. Equipped with the perfect baking "Success" oven. Booklet free.

GUARD YOUR CHILD'S EYES

No child should be permitted to attend school where there are children with bad cases of "sore eyes," declare Government educational authorities. "Better that the child miss a term of lessons than the use of his eyes."

"Teach your child to bathe tired eyes with a solution of table sale in cold water and refrain from rubbing or pressing his eyes. Eye-rubbing, nose-picking, ear-scratching, nail-biting, and picking at scratches or pimples are exceedingly dangerous habits against which the mother should set up strict prohibitions early in the child's life.

"Another phase of care of the eyes which should not escape the mother is the provision of adequate and proper illumination for home study. Where oil lamps are used they should have large wicks and clean chimneys. Ground glass shades should be provided to soften the light.

"The table at which the child studies should be covered with a dull-surfaced dark cloth, green or gray felt, or some similar cheaper material. If gas or electricity is used, the child should have a good table lamp with a shade adjusted low enough to prevent direct rays striking into his eyes.

"In reading, the child should sit in a comfortable chair with left shoulder and back turned to the light and book held in hand. Bending over the table on which the book rests not only injures the eyes, but endangers the spine and lungs."

YOURS TO ENJOY

You'll Like the Flavor

PRACTICE MAKES PERFECT

A young Burnley weaver, according to an English paper, was taking her little baby to church to be christened.

Its father had been in the trenches for three months, and it was impossible for him to get home for the ceremony.

The baby smiled up beautifully into the minister's face.

"Well, madam," said the minister. "I must congratulate you on your little one's behavior. I have christened two thousand babies, but I never christened one that behaved so well as yours."

The young mother smiled demurely, and said:

"His grandad and me hev' bin practisin' a wi' him for a week wi' a bucket of water!"

THE CROWNING HARDSHIP

Of the many witticisms attributed to the late Joseph H. Choate, our favorite is his famous toast to the fair sex, given some years ago at a dinner of the Pilgrims:

"Women, the better half of the Yankee world, without whose aid the stern Pilgrims never could have achieved the historic title of the Pilgrim Fathers! The Pilgrim Mothers were more devoted martyrs than were the Pilgrim Fathers, because they not only had to bear the same hardships that the Pilgrim Fathers suffered, but they had to endure the Pilgrim Fathers besides."

SOME THINGS TO REMEMBER IN MAKING FRUIT CAKE

Buy the best quality of everything.

Cream the butter and sugar thoroughly.

Have fruit well floured so that the pieces will separate.

Mix thoroughly so that the fruit and nuts will be evenly distributed through the dough.

Line pans with oiled paper and bake in a very slow oven.

A metal or glass spoon is easier to use in making these cakes than is a wooden one, as this heavy mixture has a tendency to gather on a wooden spoon.

HER IDEAS OF MEN

A little girl wrote the following composition on men:

Men are what women marry. They drink and smoke and swear, but don't go to church. Perhaps if they wore bonnets they would. They are more logical than women, also mor zoological. Both men and women sprang from monkeys, but the women sprang farther than the men.

CLEANING SOILED RAINCOAT

Choose a fair day so that the work may be done out of doors. Dip the coat in cold, soft water and spread out on a large board or table. Scrub well with a stiff brush, using soft water and white soap; when thoroughly cleaned dip the coat several times in clear water until all suds are removed. Do not wring .ubt hang in the air to drip dry.

CORN MEAL GRIDDLE CAKES

Sift together one cupful each of corne meal and white flour with two heaping teaspoonfuls of baking powder and one-half teaspoonfuls of salt. Add one tablespoonful of molasses and one pint of milk. Mix well and bake on a hot griddle.

JOHNNY CAKE

To one cupful of yellow corn meal add one cupful of white flour, one level teaspoonful of salt, one well-beaten egg, one cupful of sour cream in which one teaspoonful of soda has been dissolved, and one-half cupful of molasses. Beat well and bake in a greased pan in a hot oven.

CORN MEAL PEACH PUDDING

Mix together one cupful each of corn meal, whole wheat flour, and white flour, add two cupfuls of thick sour milk in which one teaspoonful of soda has been dissolved, one-half level teaspoonful of salt, a large half cupful of molasses and one pint of canned peaches cut in small pieces and drained of their juice. Steam three hours and serve with cream or sweet sauce.

CORN MEAL MUFFINS

Sift together one cupful each of white flour and yellow corn meal with two and one-half teaspoinfuls of baking powder and one-half level teaspoonful of salt. Add two well beaten eggs, two tablespoonfuls of sugar and two tablespoonfuls of butter, melted. Add one cupful of sweet milk and beat well. Bake in greased muffin- pans in a hot oen.

CORN MEAL FRITTERS

To one pint of corn meal mush add two well beaten eggs, one-half cupful of milk, one teaspoonful of baking powder, one-half teaspoonful of salt and flour to make a drop batter—about two cupfuls.

Beat well and fry in butter or fat until nicely browned.

Sprinkle with sugar and cinnamon and serve.

CORN MEAL GEMS

To two wellbeaten eggs add one cupful of thick sour cream, three tablespoonfuls of sugar, one cupful each of corn meal and white flour, and one-half teaspoonful of salt. Beat well and then add one teaspoonful of baking soda dissolved in one tablespoonful of warm water. Bake in greased gem pans in a hot oven.

LIME AND ITS USES IN AGRICULTURE

(Continued from page 467)

not be due to acidity of the water or filter paper used, a blank test should be made in the same manner, but using no soil."

Forms of Lime

In the above discussion we have used the term "lime" without designating any particular form. It now remains for us to deal with the various forms of this materlal on the market.

There are several forms of lime that may be used for agricultural purposes. These are quicklime, air-slackd lime, hydrated lime and ground limestome.

Quicklime must be slaked before it can be evenly distributed over the ground. The best plan is to distribute it over the field in small heaps much as is done with stable manure. Fifty pounds to four square rods will give an application of one ton per acre. If water amounting to one-third the weight of the lime be added and the heap covered with about an inch of soil, the lime will soon slake, when it may be spread with a shovel. This latter operation is not a pleasant one, but if the slaked lime is mixed with earth and a damp day chosen for the work, it may be accomplished without any great inconvenience.

Hydrated lime is simply the quicklime slaked, screened and bagged. It is, consequently, more expensive, but its action in th soil will be the same as the quicklime slaked in the field. Generally speaking it is too expensive a form to use for agricultural purposes. Where a small amount is needed for a garden, it would be a very convenient form to use.

Air slaked lime is quicklime that has been allowed to slake without the direct addition of water. It differs from the freshly slaked lime in that it has taken up some carbon dioxide from the air, and patr of the lime has passed back into the carbonate condition. The amount that has been thus changed will depend upon the length of time the lime has been exposd to th air.

Ground limestone is simply the limestone rock, similar to that which is burned in the preparation of quicklime finely pulverized. Naturally the more finely it is ground the quicker it will react in the soil. The coarser-ground material will remain an active agent fo ra longer time in the soil. Consequently, it is not essential that the whole of the material be very fine. Generally speaking, if the rock is so pulverized that the larger particles are no bigger than flax seed and all the fine material that would naturally be formed in the process of grinding it remain in it, ti will be fine enough. The very finely pulverized material costs more to prepare and is more difficult to handle, and does not serve the purpose any better; for applications of ground limestone only need be made at intervals of four or five years. The finest material will come into use first and the coarest later. At the same time, it may prevent a too rapid leaching away of the material.

Gypsum, or sulphate of lime, is found in beds or deposits in various parts of the Dominion. When pulverized, it is very commonly called "land plaster." It is a valuable source of lime, as the compound is more soluble in water than the carbonate of lime, but it does not neutralize the acid or sour soils, and can not therefore, take the place of the above mentioned forms of lime for this purpose. In other respects, gypsum, or land plaster. may substitute lime, and being more soluble, may be applied at a much less rate per acre. It also contains some sulphur, which some authorities now think may have a special value in the soil.

Marl is found in beds or as deposits, varying from a few inches to several feet in depth, and it is usually covered with a layer of partially decayed organic matter, commonly called muck. In some cases the deposit is practically pure calcium carbonate; in other cases it will be found mixed with clay, sand or organic matter. Its value for agricultural purposes depends upon the calcium carbonate it contains. It may be drawn directly from beds and applied to the land. or it may be taken out and dried and pulverized, when it may be used in the same way as ground limestone. It is easily reduced to a fine powder, and is a valuable source of carbonate of lime for agricultural purposes.

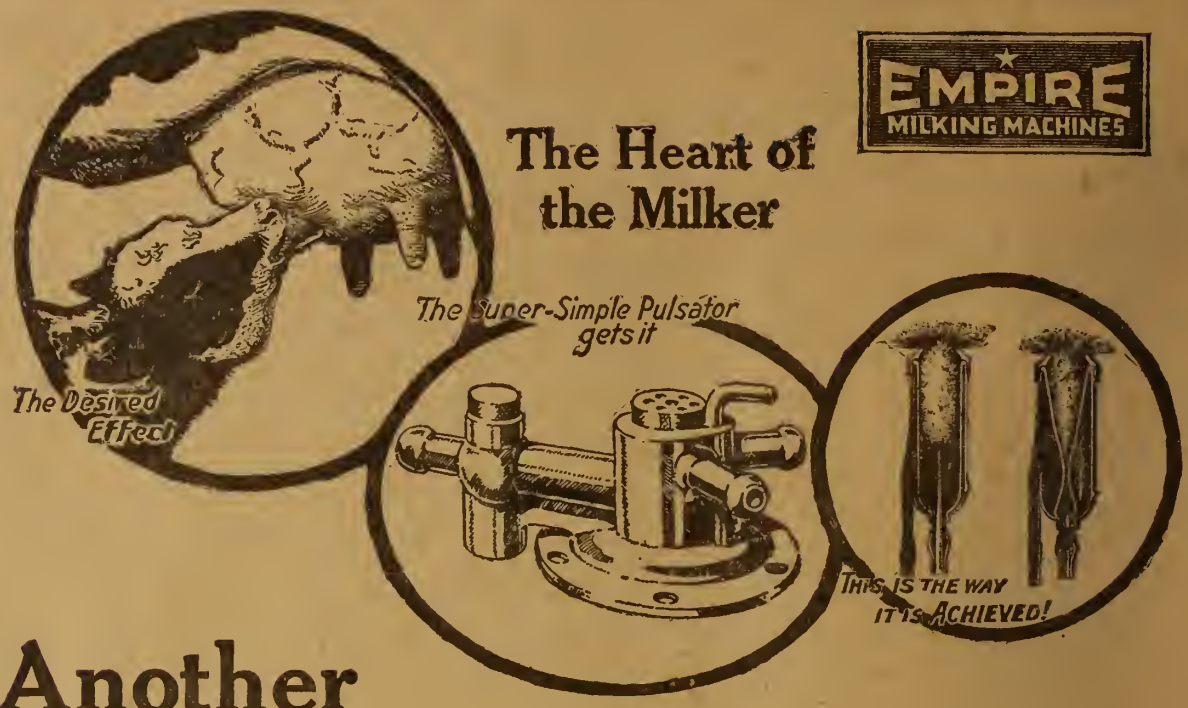
Lime kiln refuse is a product from the lime kiln and consists of unburnt limestone, quicklime, air-slaked lime and sometimes may contain wood ashes, clay or asnd. The ashes are derived from the wood which was used as fuel in burning the lime. This material is somewhat variable In composition, but it is frequently a cheap source of lime, and when wood ashes are mixed with it, there may be considerable potash present.

Gas lime is a by-product in the purification of illuminating gas. It contains certain sulphides of lime which will destroy vegetation, and hence the immediate application to the soil is not advised. But if it is put out in small heaps or spread out in such a way that the air can get through it, these harmful sulphides will in two or three months' time be converted into sulphate of lime. It is then essentially a mixture of carbonate of lime and sulphate of lime or gypsum, both of which have agricultural value and may be used fo rall the purposes for which ground limestone and gypsum are employed.

Acetylene tank residues are essentially calcium hydroxide or slaked lime. It will probably be partially carbonated. depending on the length of time it has been exposed and bay be used for the same purposes and at the same rate per acre as described above for corresponding products.

Equivalent Weights

In dealing with these various forms of lime, it is well to remember that 56 pounds of quicklime will have the same action, especially in correcting acidity, as 74 pounds of slaked lime and 100 pounds of carbonate of lime,

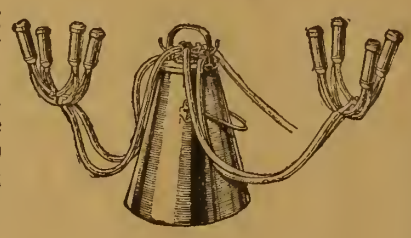


Another Battle Won for Dairymen

FOR months we have been experimenting—investigating—testing—fighting, to find a way to make the Empire Milking Machine, already the unquestioned leader, still more efficient for the dairy farmer.

THE BATTLE IS WON.

We have given the milking machine a new heart—the pulsator is the heart of the milking machine—and the result of our experiment, the new Empire Super-Simple Pulsator, is the most wonderful development since the invention of the Empire—the competent milking machine.



To be successful a milking machine *must* have a perfectly acting pulsator to cause the alternating action of suction and massage on the teasts (to imitate the calf's "suck and squeeze") to occur with absolute regularity; and to make the change from suction to massage and back again instantaneous.

The Empire Super-Simple Pulsator, the pulsator without a piston, does that and more. It really is *Super-Simple*—so simple that it can be taken apart and put together again in less than two minutes. ***It has but five moving parts; nothing to wear out or "get out of gear." It cannot lose vacuum, so its action is perfect.***

It places the Empire Milking Machine immeasurably in advance of all competition. Your cows should be milked by an Empire Milking Machine with the new Super-Simple Pulsator. It will milk them more rapidly than ever—it will solve your labor problem—it will increase milk production at a decreased cost; it will transform milking from drudgery into a pleasant chore.

Our factory is overtaxed by the increased demand for Empire Milking Machines, so go to your dealer at once, see the new Super-Simple Pulsator and tell him to order your Empire outfit without delay; or write for Catalog K

THE EMPIRE CREAM SEPARATOR CO. OF CANADA, LIMITED

MONTREAL 87 TORONTO

or ground limestone; or one ton of quicklime will be the equivalent of 2,643 pounds of hydrated lime or 3,571 of carbonate of lime. In general practice, two tons of ground limestone is considered equal to one ton of quicklime. As has been pointed out, air-slaked lime is partly slaked lime and partly carbonate of lime, and is, consequently, a mixture of the hydrate and carbonate of lime. Its value will, therefore, be intermediate between that of freshly slaked lime and the carbonate, that is 56 pounds of quicklime will be equal to a weight of air-slaked lime between 74 and 100 pounds. From the above data it will be seen that if quicklime is worth $5.00 per ton, ground limestone, equally free from impurities, would be worth $2.80 per ton and slaked lime $3.80 per ton. Furthermore, the cost of transportation of the ground limestone will be approximately double that of the quicklime.

Which Form Should be Used

The cost of the material, however, is not the only factor to consider in deciding which form of lime shall be applied. The character of the soil and the rapidity of action required must be considered.

Carbonate of lime, that is, ground limestone or marl, is much milder in its action than the freshly slaked lime, and is therefore the better material to apply where rapid action is not an important point, and especially on light sandy and gravelly soils. These soils are usually poor in organic matter, due to the free oxidation induced by their open porous nature. Freshly slaked lime is generally credited with hastening this oxidation, and on light soils, would thus cause too rapid a dissipation of this valuable material. On heavy clays, freshly slaked lime may be used to advantage. There is not the same fear of unduly hastening the decay of the organic matter and its action in causing flocculation of the clay particles will be more rapid and the improvement in the physical condition of the soil more quickly obtained. On soils between the sands and clays, experiments in other countries indicate that the carbonate of lime will probably give the best results through a term of years, although the returns for the first year or two may be in favor of fresh burned lime.

For mucks and peaty soils that may be decidedly acid, the fresh slaked lime is to be preferred. Quite frequently, it is found that the organic matter in ethse soils is not sufficiently decayed to give the best results in crop production, consequently, if the lime hastens the decay, an improvement in texture will be effected as well as the acid neutralized.

Amount of Lime to Apply

The amount of lime that should be applied naturally varies with the nature of the soil, and the degree of acidity. We have generally recommended one ton of fresh lime, or two of ground limestone, per acre. This is probably enough for light soils that are not very acid, but experience is showing us that much heavier applications may be made on clays that show acid with lit- uudhhuuuuuuuuuuuuuuuu iMY mus paper. Too heavy dressings with fresh lime tend to sterilize the soil for a time, that is, the lime checks the life process of the organisms within the soil. There is, however, no fear of this with the carbonate of lime. On light soils it is safe to apply from one to two tons of the ground limestone, and on clay the same amount of the fresh lime, or double that amount of limestone dust. But in some cases the clays may be so sour that much heavier applications are required to neutralize the acid present and give the maximum results.

The Time to Apply Lime

Regarding the time of application, due consideration should be given to other necessary farm work. Lime is not for the sole benefit of any particular crop, but for all the crops in the rotation, although its greatest influence is upon the leguminous crops. A good plan is to apply the limestone dust after plowing and before preparing the seed bed for the legumes. The main essential is to get the limestone on the soil, and convenience or economy in getting the work done is usually the factor which should govern the time of application. There is no reason why limestone dust, and especially limestone screenings, should not be applied in the winter, provided the snow is not too deep that the material can be evenly distributed, and that the land will not be plowed in the spring.

How to Spread the Limestone

The main point is to get the material evenly distributed over the ground. It may be spread with a shovel either directly from the wagon or from heaps placed at regular intervals over the ground. Possibly it may be applied by means of a grain drill, or the manure spreader; but undoubtedly the most convenient method is to use the spreaders made for the purpose. In a recent bulletin Dr. Hopkins of Illinois describes how to make a "home-made" spreader which he considers better than those on the market, especially where heavy applications of the ground limestone have to be made. The instructions are as follows:—

"Make a hopper similar to that of an ordinary grain drill, but measuring 8¼ feet long, with sides at least 20 inches wide and 20 inches apart at the top. The sides may be trussed with ⅜-inch iron rods running from the bottom at the middle to the top at the ends of the hopper. Let the bottom be 5 inches wide in the clear with 2-inch holes 5 inches between centres. Make a second bottom to slide under the first on straps of iron 10 inches apart, which should be carried from one side to the other under the hopper to strengthen it, also with holes to register. Both bottoms may be of sheet steel or the lower one may be of hardwood, reinforced with straps of iron if necessary.

"To the lower and movable bottom attach a V-shaped arm projecting an inch from under the hopper, with a half-inch hole in the point of the V, in which drop the end of a strong lever, bolting the lever loosely but securely

IMPERIAL SERVICE

If you are in doubt about the proper lubricant, *ask the Imperial Oil man.* He will give you courteous attention and sound advice on your lubrication problems. That is part of Imperial Service.

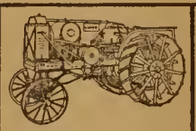
HUMOR YOUR MACHINERY

GIVE machines correct lubrication and they behave well. You get smooth-running, quiet engines and full rated horse power day in and day out. But you must humor them. If you are burning kerosene in your motor instead of gasoline, a special lubricant will probably be necessary to meet the changed conditions. A loose bearing and a tight bearing require different treatment. **There is a correct lubricant for every mechanical need.**

At Imperial Oil stations in every part of Canada, you can get the just-right lubricant for every need and service.

All Imperial lubricating oils are sold in steel barrels and half-barrels—convenient and economical. There's no waste. You use every drop you pay for; and you are sure it is uniform and clean.

A Correct Lubricant for every Farm Machine



For Gasoline Engines, Tractor, Auto or Stationary
POLARINE OIL
STANDARD GAS ENGINE OIL
For Kerosene Engines, Tractor or Stationary

to the hopper with a single bolt, and fasten to the top of the hopper a guide of strap iron in which the lever may move to regulate the size of the opening by sliding the lower bottom. Make a strong frame for the hopper, with a strong, well-braced tongue.

"Take a pair of old mowing machine wheels of good size and with strong ratchets in the hubs, and fit these to an axle of suitable length (about 10 feet) and 1⅜ or 1½ inches in diameter. The axle should be fitted with journals bolted to the under side of the frame. Make a reel to work inside the hopper by securing to the axle, 10 inches apart, short arms of ⅝-inch by 1-inch iron and fastening to these arms four slats or beaters of ⅝ by ¾ inch iron about an inch shorter than the inside of the hopper, the reel being so adjusted that the beaters will almost scrape the bottom but will revolve freely between the sides. The diameter of the completed wheel is about 5 inches and it serves as a force feed.

"Hundreds of these 'home-made' machines are in use, and they are usually more satisfactory and more durable than anything on the market. The cash expense for such a machine has varied from less than $10 to more than $30, depending on how much of the materials and labor must be paid for. Farmers with some mechanical skill may hire only the necessary blacksmithing."

Experiments with Lime

We have placed very few experiments with lime with the idea of gathering actual weight of increase produce. This was partly because the soil on this farm does not need lime and gives no response to its application, and partly because of the difficulty of carrying out co-operative experiments that extend over a number of years. In 1913 we did get some actual figures from an experiment in which quicklime was applied at the rate of one ton per acre, to a sour loamy soil that was to be planted with corn. The unlimed check plot gave a yield of 690 pounds of crop, the limed plot gave 1,865 pounds.

Experiments on the light sand plots in Norfolk County, Ontario, showed that the limed and manured plots gave an average of two tons more potatoes per acre than where manure alone was used. These are very large increased yilds, but we must remember that when a soil is sour, it is a waste of time and money to cultivate until this is corrected, for the economic use of every other fertilizing material, including manure, depends upon the lime supply.

There should, however, be little need of demonstrating the fact that lime will improve soils deficient in this constituent. We have, consequently, spent more time in trying out some of the cheaper forms of lime that can now be procured. Two years ago, and again last spring, we had a few carloads of limestone screenings from stone-crushing plants, applied. This is the dust and finely broken stone which is sifted out of the crushed stone before shipping. A part of this is fine enough for agricultural purposes, but a large part is too coarse to effect any immediate results. At one quarry we were able to procure screenings from which two grades of coarser particles had been removed. The remaining material is so fine that 75 per cent. of it will pass a 10-mesh sieve, and 20 to 25 per cent. a 100-mesh sieve, or a sieve with 10,000 openings to the square inch. As this limestone dust can be procured for very little more than cost of loading, we had a few car loads applied experimentally last spring. It was expecter that this material would be slower in its action than fresh burned lime or the specially prepared and more finely ground limestone. Many of the experimenters reported that the season was so wet that they had little chance of judging results, and generally speaking it appeared as though where the dust was applied at less than three tons per acre, there was no appreciable result. However, where for any reason it was applied in heavy dressings, good results were plainly visible even the first year, both in the physical state of the soil and in the yield of crop. The effect of this application will probably be more plainly seen next season.

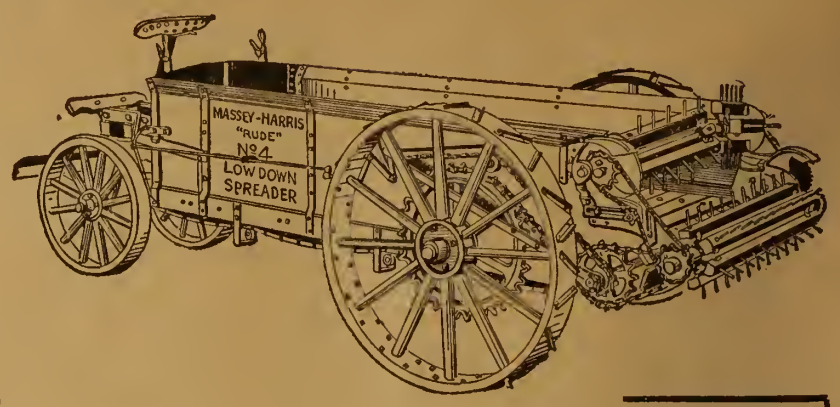
When we commenced experimenting with limestone screenings, there was, so far as we were aware, no home-prepared ground limestone for agricultural purposes on the market. Now there are several firms producing this material. Our experience with the screenings leads us to think that, while they are a cheap material, it will not pay to purchase these, even at the low price, and pay the long freight haul. The finely ground limestone is much quicker in its action and may be purchased either in bulk or in paper or cotton sacks. When bagged it comes under a higher freight rate than the screenings, which are shipped in bulk in open cars. It is however, more conveniently handled and it si possible to purchase a few tons, whereas the other must be shipped in carload lots. The bagging must, of course, increase the cost of the material.

As stated earlier in this article, our experience leads us to believe that in som parts of the country the soil is so sour that heavy applications of lime are needed to correct it. This state exists chiefly in clays and muck soil. We have under experiment now some muck soil which is used for producing onions and on which the growth was not satisfactory. Analysis shows that it carries sufficient acid to require ten tons of freshly burned lime to neutralize the acid in the soil one foot deep over the acre. On this we have applied quicklime on small plots at varying rates up to ten tons per acre and the ground limestone up to twenty tons per acre. A similar experiment has been placed on a heavy clay soil. An-

MASSEY-HARRIS SPREADER

Low Down

Wide Spread



Here is a Spreader that is low-down, but not too low—plenty of clearance under the Frame.

It is a Wide-Spread Machine—spreading full seven feet wide, although the Box measures only 3½ feet.

Ample strength is secured by making the Frame of Steel—heavy 4-inch Channel Side Sills with Steel Cross Sills, forming the strongest Frame ever put on a Spreader.

The Simple Chain Drive does away with all Cogs, Clutches, and Springs, and when out of gear no parts of the machine are running to cause wear.

The Upper Beater is in two sections, set at an angle to spread the load out beyond the Wheels.

The Simple, Direct Drive—the Divided Beater and small size of same—the taper shape of the Bed—the Broad-Faced Wheels—the careful fitting of all parts—these combine to secure light draft.

other season's observation on the experiments now placed with the screenings, ground limestone and with quicklime, will be of interest. In the meantime we are of the opinion that it will pay farmers whose lands are sour, and who live close to stone-crushing plants, to haul some of the screenings on to their ground, and give it a trial. Those who have to bring in either the ground limestone or the quicklime by freight, should ascertain the nearest source of supply, as otherwise the cost of hauling may unduly increase the cost of the material.

Investigate the limestone deposits in your vicinity and get in touch with your local Department of Agriculture, as to the best means to make use of it.

—Extracts from a Bulletin by Prof. Harcourt, O. A. C., Guelph.

THE GREAT NEGLECT IN SHEEP HUSBANDRY

(Continued from page 463)

the province are docked and castrated. On account of the above we figure on deducting about ¼c. per pound on all the buck lambs after they get pretty well grown."

"Might state that the percentage of lambs not trimmed that I am handling would be about 30 per cent; the reduction in price runs about $1 per cwt., due to omission of castration."

"The percentage of lambs coming to market here not catsrated is about 15 to 20 per cent. Good ewe and wether lambs weighing from 80 to 90 pounds each are selling here now at 8 cents per pound. Heavy buck lambs sell at 6¾ cents a pound, and these is also the reduction in price made by the buyers."

"This season's lambs offered for sale up to October 1 showed about 75 per cent bucks; since October 1 about 25 per cent bucks.

"This pronounced variation in periods is undoubtedly due to the fact that on October 1, 1913, there was a ruling made at the Live Stock Exchange, Toronto, to deduct 75 cents per head on all buck lambs. In the early part of this season the inspection was discontinued and has not been re-established. Our assumption is that the shippers generally understood it would be established October 1, which is the reason for shipping buck lambs prior to October 1. The fact that the ruling was established last year undoubtedly has been the means of increasing castration by the raisers of the country."

"We judge about one-third of our early native lambs which arrive at this market during July, August and September have not been castrated nor docked. However, the balance of the year the native lambs are practically all castrated.

"In regard to our western range lambs will add, that it is very seldom that a lamb is found which has been neglected in either regard and we find them much more desirable, from not only a killr's standpoint, but for feeding purposes as well.

"Your campaign along these lines should receive the approval and co-operation of every farmer throughout Canada, as it will mean dollars to every man who raises lambs."

"We think that about 25 per cent of the lambs coming here are not docked. Of course this is only a guess, as we have not taken the necessary pains to know definitely.

"Regarding the reduction in price due to the omission of castration we would say that after the first of September, buyers of lambs would give ½c per pound and upwards for ewe and wether lambs than they would for bunches of buck lambs. We are getting a bigger percentage of castrated lambs this year than we were last year, but there are still a large number of lambs coming here which should have been castrated."

"We find that practically 40 per cent of the lambs coming to our market are not docked nor castrated. On an average they sell at from 50 to 75 cents per cwt. less than ewes and wethers.

"At the present time there is a marked difference. Ewes and wetaers have been bringing this week from $7.90 to $8.10 per cwt., while ram lambs have been bringing from $6.75 to $7 per cwt."

While the prices quoted in the foregoing letters are those of three years ago, the fact remains that the factors governing these prices are just as potent and more widely recognized now than they were then.

Do not neglect to dip your sheep and lambs, it will mean more money in your purse next fall.

$19,550 PAID FOR BULL CALF

A joint sale of Shorthorns was held at Penrith, Scotland, last week. Prices were on a high level, and many animals were bought for export. The record price of $19,550 was paid for a bull calf. Ninety-nine females averaged $541 and 260 bulls $555.

THE UNITED FARMERS OF N. B. HOLD MONSTER CONVENTION

(Continued from page 469)

tell whether a man is a hopeless case or not. They put him in a tank and turn on the water. Well the water gradually rises and rises. When it gets about around his neck they hand him a little dish. If he starts to bale furiously with the dish instead of turning off the tap. he is hopeless. I do not think we are hopeless.

Our politics are wrongly divided. To have unity we must not have grit and tory. There is a man from Nova Scotia, President of our branch, R. W. Burnburg He tells a rather good story. He says that the farmers work on an average of 11 hours a day. The average town man works about eight hours a day. That makes a difference of three hours a day. Now a farmer works between twenty and sixty years around the farm. Say a farmer works for forty years, three hours a day more than anyone else, how much is he worth more than anyone else? He makes twenty cents an hour, that is sixty cents a day for the entire three hours for forty years. How much do you think it would amount to at compound interest at three per cent?—Forty three thousand dollars. Do you know any farmer who has forty three thousand dollars for his spare time?

I was at a meeting not long ago in St. Catherines, the garden of Ontario, where land is worth two thousand dollars an acre. The farmers there had a meeting to discuss whether they would pull out their fruit trees and grape vines or not. My friend, Mr. Haste, had seventy acres of fruit land. He had all his grape vines pulled out. He was going to buy dairy cows and run a dairy farm. He said there was too much work to fruit at a certain time of year. I said never mind there is too much work to cows all the year around. I said supposing your land costs a thousand dollars an acre and you grow oats and barley on that land, when do you suppose you will get the interest on your investment. "The truth of the matter is," he replied, "I never did get it." How many men have had returns from their investments. Only a few of you who are potato kings in this section of the country.

We must be organized so if we desire to get what we want, United Farmers can lift up its voice. The United Farmers of British Columbia, and you United Farmers of New Brunswick, I hope you will go into this thing with the same interest as the western organizations of farmers, and bring in Prince Edward Island and Nova Scotia. Then we will have the nine provinces organized and then the government must consider agriculture. We will not then take any handouts. We will fight with one front and not put up our fight single handed, as the United Farmers of the Dominion of Canada, and I hope our line will reach from the Atlantic to the Pacific.

I was sent down here by the Council of Agriculture. They are paying my railway fare and hotel expenses. They have such an interest in you that they sent me down here not because I was the best man, but because I was the nearest. When we get this spirit from the Atlantic to the Pacific we will get together and it is time we did so. The membership represented in this Council at the present time is seventy-five thousand farmers. Saskatchewan is ahead of us; Ontario is ahead of Manitoba; Alberta is also ahead of us, and I hope that New Brunswick and Nova Scotia will soon be ahead of all of us. We hope to have a man in Ottawa at the time the House of Commons is in session, a man who will watch our interests and we will keep a man there the same as the Manufacturers keep their man thre. The only say we can do this with is money. We cannot get something for nothing. Individually we are poor, but we are not poor collectively. We are the bon of the country if we only thought so. Everywhere we find farmers apoligising because they are farmers. We are the people. We are next to nature. We have in our county of Wellington the agricultural college of Guelph. About twenty-five thousand people visit this every year. There are about twelve thousand inhabitants, and to look after all the twenty-five thousand farmers who visit that city every day, it has never been necessary to call in an extra policeman. The agricultural people are law abiding. If we were not, we would not have had the patience we have had all these years.

At the first meeting of the Grain Growers in Winnipeg, five hundred delegates were present. Before the meeting the secretary, Hon. T. A. Crerar, told me that they had lost one quarter of a million dolalrs through grain going through to Liverpool. I said to him, "What are you going to do about this, will you tell them." He said, "Yes, I have faith in the farmers." He told the farmers present he had lost $250,000.00 and all he had to

It's Cheaper to Paint than Repair

YOUR barn—if it is four years old or older—is worth at least 50 per cent more today than when it was built. Lumber and cement are so high that it would cost half-as-much-again to build this year as it did in 1914. So it is obvious that either a new barn or an old one is today so valuable a property that its owner *must conserve it* unless he is committed to a policy of wilful waste. Keep your barn—and *all* your buildings—protected. And let your paint-protection consist of an economical paint. Use the barn paint that goes farthest—lasts longest.

Imperial Barn Paint

This paint, while not to be recommended for a house, is a splendid, economical protection for your barn, roof, fence or outbuildings. It is made from good materials, "covers" well and dries hard.

Ask your dealer for Color Card.

Other B-H Products of Sterling Worth

For the Exterior of Your Home

Be satisfied with nothing less than *B-H "English" Paints.*

Years ago we established as their basis this standard formula:

70% Pure White Lead
(*Brandram's Genuine*)
30% Pure White Zinc

Today, with white lead so expensive that many manufacturers are using as little of it as possible, we are still committed by our hard-and-fast guarantee, to the use of this same proportion—thus ensuring users of this brand the same wonderful finish and the same dependable durability that have made *B-H "English"* pre-eminent among paints for exterior uses.

For Interior Varnishing

The name *"CHINA-LAC"* suggests a china-like finish—and that is just the kind of finish you get from the use of *China-Lac*—the perfect varnish stain. Being transparent, it preserves the "grain-beauty" of the natural wood—at the same time giving splendid color effects. Easy to apply—not affected by either hot or cold water.

For Staining the Roof

Our *"ANCHOR"* Brand Shingle Stains are specially prepared to preserve wood from decay. Easy to apply on rough surfaces, they give a better effect than paint. Shingles may be dipped or stain brushed on.

For Varnishing a Floor

Our *"FLOORLUSTRE"* finishes a floor with a lustrous coating of the most durable enamel. Will stand hardest wear—will not show scratches. Excellent for interior floors.

For Porch Floors, Ceilings, Posts, etc., where surface is exposed to the weather, use *B-H Porch Floor Paints.*

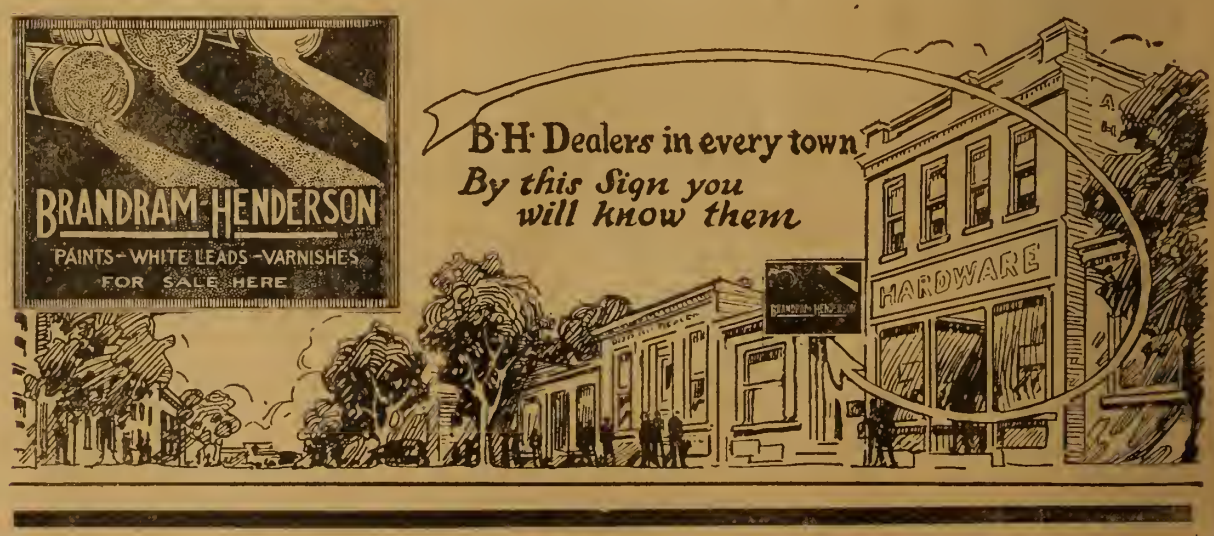
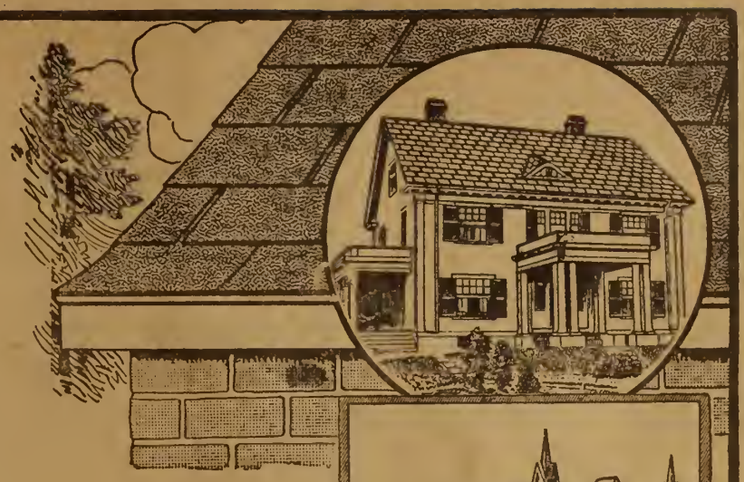
MONTREAL HALIFAX ST JOHN TORONTO WINNIPEG CALGARY EDMONTON VANCOUVER



Artistic and Economical

There is a beauty and individuality to a roof covered with Brantford Asphalt Slates that appeals to all lovers of the artistic. There is an economy in their low cost per year of service that appeals to all seekers of a sound roofing investment.



Brantford Asphalt Slates

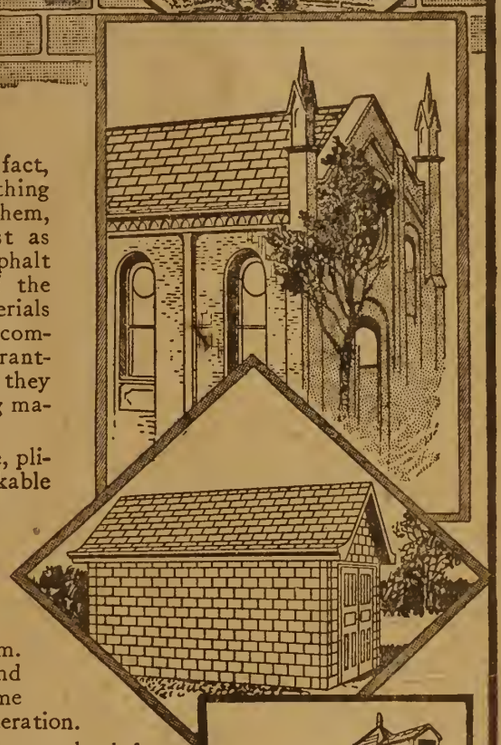
are made of a special grade of long fibred felt thoroughly saturated and coated with asphalt, on top of which is a surface of crushed slate.

The asphalt is a blend of soft and hard asphalts, tempered to resist the extremes of the Canadian climate. The slate is the real quarry slate and its colors of reddish brown and dark green are the natural colors of the slate and are therefore unfadeable. Brantford Asphalt Slates never require painting. It would be hard to imagine a more durable roofing, let alone make one.

Brantford Asphalt Slates are absolutely water-proof. They do not absorb moisture, therefore are not alternately swelling and drying out.

They are wonderfully fire-resistant. There is no record of a fire ever starting on a roof of Brantford Asphalt Slates. You can put a whole shovelful of red hot coals on a roof of Brantford Asphalt Slates and, while the heat from it might melt some of the asphalt, the slates would not ignite.

The cost of these slates is very moderate—and if you have an old, leaky roof you can reroof it with Brantford Asphalt Slates without requiring any additional braces. And the slates will make a completely watertight and permanent roof. In fact, there is practically nothing to wear out about them, and they should last as long as the walls. Asphalt and slate are two of the most enduring materials known to science, and combined as they are in Brantford Asphalt Slates they form the ideal roofing material.



Being regular in size, pliable and nothing breakable about them, Brantford Asphalt Slates are easily and quickly handled and thus valuable time is saved in laying a roof with them. With labor scarce and high the saving of time is an important consideration.

For homes, churches, schools, golf clubs, public buildings, garages, barns, silos, or any buildings with pitch roofs, (note our illustrations), there is nothing more artistic, durable and economical than Brantford Asphalt Slates.

Write for interesting booklet.

show for it was some very dear bought experience. Not a man moved. Then one man in the back of the hall said, "tell the directors to go on and pay off the $250,000. The secretary said, "this is the greatest day in the history of agriculture," and the very next year they made one million dollars.

The Grain Growers came to our rescue and they did the same for us as they will do for you. They sent men to help us organize and we will send men to help you organize if necessary. We are trying to do a great deal in Ontario. Ontario is the graveyard of farmers organizations. We have the old brains there, however, and we have the result of their experience. We organized four years ago last March on the 19th or 20th. At present we have fifteen thousand members.

When we first organized we had many things to contend with. The bigger we got, the bigger our problems became, and we had politics to contend against, but we will have no more tory and grit gods now. We do not ride the goat and there is nothing secret about it. We pay fifty cents for membership. Farmers have said to me, what do I get for fifty cents, and I said to them, what do you expect for fifty cents. You get more than you deserve. Bootblacks pay their organization $5.00 apiece; telephone operators pay $11.00 and so on I think we will have to raise the fee to ($1.00) one dollar. Every year in Toronto we have a meeting. Any club that has upwards of twenty members is entitled to one delegate. If you had one hundred men you could send five delegates. We pay their railway fare, but if we did not pool the cost, we would not have any delegates. In New Brunswick you are near together and the railway fares would not be so great, should we go short the Toronto clubs make up the difference. Our railway fares cost us last year fourteen thousand dollars. The editor of the Toronto World said "the meeting was the greatest I ever saw" and wished all the other editors could have been there. It was an eye opener to him, because the man about town considers the farmer an inferior being, and I am sorry to say that the farmer has accepted this position. Out of the fifty cents we hire the hall, pay for the printing and advertising and the propaganda work is carried on for the benefit of the agricultural industry. We fought the price of grain from $1.90 to $2.20 per bushel. The Commissioner said to me, how many men have you got in Ontario. I said we have about 12,000. He said could you tell me the number of farmers in the Province of Ontario. I said about 200,000 or a little over. I saw in a moment that we did not represent a fringe of agricultural industry.

We sent a delegate to fight the Bell Telephone Co. They have municipal and independant lines and we want a free interchange. Our case was presented and practically admitted, but the war stopped it.

The railway companies have raised their freight and passenger rates. They asked the Government for more money. We telephoned to the manufacturers to help us but they wouldn't do this because increased freight to them meant increase in their goods and that meant that the farmers would have to pay a double price on their increase. We fought hard. Our lawyer was a good one and he fought. We got this increase set aside and it was put off from June until after the election. Then the Government said they would give us an issue and it was put off again from Jan. to March. We had to go down again and we were beaten and you are paying increased freight rates today. The original farmers who

CAR LOT POLICY

The following revised statement of the Car Lot Policy will become effective May 1st, 1918, and will replace all statements with regard to same previously issued.

Under this Policy the Dominion Live Stock Branch will pay reasonable travelling expenses of a farmer residing in Canada, or authorized agent of farmers residing in Canada, who purchases one or more car loads of breeding stock under conditions as hereinafter set forth:—

(1) Assistance under the Policy will be confined to purchases of female breeding stock (cattle, sheep or hogs) made at the Union Stock Yards, Toronto; Point St. Charles Stock Yards, Montreal; or the East End Stock Yards, Montreal.

(2) No assistance under this Policy will be allowed when the stock is purchased for speculative purposes.

(3) A car lot shipment must include not less than twenty head of cattle(forty sheep or forty hogs. In a mixed shipment, two sheep or two hogs will be accepted as equivalent to one head of cattle in fixing the minimum of one car.

(4) Any person desiring to take advantage of the Policy must make formal application to the Representative of the Branch at his nearest Stock Yards, and, before commencing to purchase, must receive from him a Certificate authorizing assistance under the Policy. This Certificate will indicate the Stock Yards at which the purchase must be made if the benefit of the Policy is allowed. In all cases, the Certificate will direct the purchaser to his nearest Stock Yards, unless, in the judgment of the Representative of the Branch, the condition of the Market at the time warrants an exception being allowed.

(5) Expenses will be allowed covering Railroad transportation from the home of the purchaser to the Stock Yard at which the purchase is made, also hotel expenses for a reasonable time required to make the purchase.

(6) The purchaser should secure a receipt for his hotel expenses and should attach this receipt to his account. The account should be forwarded in triplicate on forms which will be supplied for the purpose.

(7) The purchaser is further required when forwarding his account to include on forms supplied by the Branch a statement regarding the purchase. The Certificate secured from the Representative of the Branch previous to purchasing should also be attached to the account.

(8) Parties purchasing female breeding stock under the terms of the Car Lot Policy and who comply with the terms of the Free Freight Policy of the Branch will be entitled to the benefit of both Policies on one shipment.

(9) If desired by the purchaser, the services of the Representative of the Branch at the markt will be available in an advisory capacity. The actual purchasing must be done, however, by the buyer himself or by his authorized agent. Under no circumstances will any responsibility in this connection be assumed by any officer of the Branch.

The Markets Representatives of the Branch at the Different Stock Yards in Eastern Canada are as follows:—

W. H. Irvine, 1127 Keele St., Toronto, Ontario.

S. H. Chipman, Live Stock Exchange, Brdige St., Montreal, Quebec.

BUYING NEGLECTED BEES TO INCREASE HONEY PRODUCTION

By F. W. L. Sladen, Apiarist, Dominion Experimental Farms, Ottawa

Patriotism is apt to take strange forms in these days of stress. One of the ways to carry out the motto "Food will win the War" may be to sell the bees to a neighbour.

Of all the suggestions that have been made for greater honey production this year, none, at this eleventh hour, promises to be more effective than the sale or lease of bees owned by those who have not time to attend to them or are inexperienced in modern methods of bee-keeping, to those who have gained this knowledge or are making an effort to do so, because the man who knows how, is likely to obtain several times more honey per colony than one who leaves the bees alone or employs old fashioned methods. The season is so short that any increase of bees by breeding that the beekeeper can make is largely at the expense of the honey crop; he must therefore buy bees in the spring to get an increased return within the year.

Because it takes about two years for a man to learn to become an expert beekeeper, and many own bees without being in a position to give them the attention they need to make them fully profitable, a quicker increase in honey production will in many cases be obtained by a change in ownership than by an attempt to inculcate better methods of management, valuable as this work always is. We do not know exactly how far it will be possible for beekeepers to increase their stock by the purchase of bees without combs from the South. An unfavourable sea-

GROW STRAWBERRIES

In the rush of other work, do not forget to set that new bed of strawberries this spring. Many growers are cutting down their acreage on account of labor difficulties and the high price of other crops. Production for the next few years will be cut in two and berry prices are sure to be high. Our advice to our fellow Fruit Growers is, grow all the grain you can, but DON'T GIVE UP THE STRAWBERRY. Among other varieties we recommend Senator Dunlap and Warfield at $4.00; Sample, Arnout, Buster and Glen Mary at $5.00; Wm. Belt, Dr. Burrell, and Bubach at $6.00 a thousand. The great everbearer, Progressive at $1.25 a hundred. Send a card for our free Catalogue.

CYRUS & MANNING ELLS, Port Williams, N. S.

son in the South, and a very heavy demand for such bees, with the entry of many inexperienced shippers into the business, caused more or less disappointment in a good many cases last spring. A further risk this spring is a possibility that a congestion of railway traffic may cause more death and delay in transit than usual. But any beekeeper can go around his neighbourhood in the spring and endeavour to buy up bees from those who have lost interest in them, incidently putting those who do not wish to sell on the track of how to care better for them, even if it is to do nothing more than to send their names to the Publications Branch of the Department of Agriculture at Ottawa for the supply of free literature on the care of bees.

While bees are now worth somewhat more than usual on account of the high price of honey, colonies in neglected condition will be found that are dear at $5.00 or even $3.00 each, others that are good value at $10.00. By buying in ones immediate neighbourhood and perhaps packing and transporting the bees oneself, the spreading of brood diseases to new districts and the less of bees in transit, as well as high transportation charges, will be avoided.

MANURE

Application of Manures.—On a majority of farms, most of the manure that is available for application to crops is made during the winter months when the animals are stabled. No advice regarding the best time to apply manures can be given that is applicable to all conditions. In general, the sooner manure can be spread upon the land after it is made, the more will the soil be benefitted. There is also a greater tonnage of manure when first made than at any other time. If piled for any length of time in the field, the weight will appreciably decrease.

Special conditions, of course, demand special treatment. Where market gardening is being practised, it is best to have the manure rotted, as quicker results are obtained in the growing crop. Young clover seeding can often be strengthened by a light top dressing early in the fall, which helps the young plants to get a stronger root hold and enables them to stand the winter better. This is particularly true with regard to the tops of knolls, or thin spots in the seeding.

Rate of Applying Manure.—Manures are often applied too freely. Rarely is it profitable to apply heavily on a small portion of the farm each year to the neglect of the balance of the farm. It is much better for the land to receive frequent and light dressings than heavy dressings at longer intervals. If 100 tons of manure are available to be used on a ten-acre field of corn, it would be better to apply the manure at the rate of ten tons to the acre over the whole field than to apply twenty tons to the acre on half of the field and allow the other half to go unmanured. Regardless of how manure is applied there is a certain amount of loss caused by leaching in the soil. The sooner the fertilizing elements of manure can be recovered by the crop being grown on the land, the less loss there will be. It stands to reason that, if all the corn plants on the ten acres reach out to recover the manure applied, there will be less loss than if the plants on only five acres are working for its recovery.

How to Apply Manure.—There are many farmers who do not make use of manure spreaders when it would be profitable for them to do so. On the other hand, farmers who do not have a large amount of manure to draw out and who make a practice of drawing it in the winter may profitably get along iwthout a manure spreader. It will scarcely pay to have a manure spreader on the farm unless the bulk of the manure is to be drawn out at a time when the spreader can be used.

Liming the Soil.—Lime is an important factor in maintaining the fertility of certain soils. If the soil contained no lime, plants upon it would not thrive. Most soils contain enough lime for the needs of the crop, although occasionally it becomes exhausted in some soils. Lime is, therefore, not usually applied as a direct fertilizer. When applied to sandy soil, it has a tendency to make it more retentive of moisture, and, when applied to clay, it has the opposite, effect making the soil more crumbly. Lime sometimes liberates the plant food, making it more soluble and thus available for the use of the plant.

Its important function, however, in modern agriculture is to sweeten sour soils. Such soils, even though rich in plant food, usually produce poor crops. If the acid in the soil can be neutralized by the addition of lime, better crops are likely to be produced. Soils are often acid where such a condition would be little expected. A simple method of determining acidity in soils is to test it with blue litmus paper. This can be purchased at almost any drug store. Take several samples of soil from different parts of the field, mix them into a paste with water, and insert one end of the litmus. Leave it for an hour and if the blue paper is turned red where it comes in contact with the paste, the soil is likely sour. Soils which do not show marked acidity sometimes need lime. The best way for a farmer to determine this is to apply lime on a strip of his field and compare the results of the crop on this treated strip with those on the untreated portion of the field.

Lime may be applied at about one ton per acre, either late in the fall or early in the spring. If air slaked lime is used, it should be placed on the land in small heaps and covered with moist soil for a few days until it has become finely powdered. It may then be spread when there is no wind.

Clover as a Manure.—Red clover and green crops are sometimes used as green manure, to be ploughed und-

The Ford Saves the Hay and Oats the Horses Eat

IT HAS been estimated that five acres of land are required to maintain one horse for a year, and that the same five acres would produce nearly enough food for two people. If 50,000 Canadian farmers each replaced one horse with a Ford, 250,000 acres would be added to the Nation's source of food supply and enough extra food made available to feed 100,000 people.

Just think what a great service this means to the country at the present time and the benefit to the farmers from the sale of food produced on this acreage.

A Ford car also saves the farmer a week or more of valuable time each year, which can be used for further productive work. The Ford travels three times as fast as a horse and rig—costs less to run and keep, and is far easier to take care of. With labor so scarce and high priced, time means money, so do not delay in getting your Ford.

er, if the land is poor in humus. Even where clover it cut for hay and only the roots and the stubble turned under, it has a marked influence in increasing the yield of succeeding crops. By means of the nitrogen fixing organism on its roots, it is able to gather nitrogen from the air and leave it in the soil in a form which can be readily utilized by growing crops. It frequently happens that decided increases in yield have been obtained from ploughing under a crop of clover. It should be emphasized, however, that the mere introduction of red clover into the farm rotation is not in itself a sufficient procedure to maintain indefinitely the productivity of the soil. The clover adds only the nitrates to the soil and removes large quantities of potash, phosphorus and lime, especially if cut for hay and the manure made from it is not returned to the soil. To get full value from clover in the rotation, the manure produced from the feeding of it should be returned to the land.

THE UNITED FARMERS OF N. B. HOLD MONSTER CONVENTION

(Continued from page 489)

put their fifty cents in the Treasury, received the benefit of the putting off of freight rates for a year.

When the United Farmers President and two other men and myself went to Ottawa to fight the increased freight rates, we had our breakfast at a cheap restaurant, while the members representing the railways, went to the Chateau Laurier. We had to sneak around the corner to save the money that belonged to the United Farmers, while the parasites went to the best hotel in the country. We are a cowardly people, if you were not farmers I would not say it, but we have not done our duty, we can do it by standing shoulder to shoulder and standing on our dignity. I am going to say there is something wrong when the Food Controller of this country says our wives can feed the hogs. I am quite sure I think as much of my wife as the food controller thinks of his.

You will meet with all kinds of opposition. You will meet with men who tell you you should not spend your money except locally. I wanted a plough and my dealer had one for $15.00. I saw one in town for $12, but my dealer says you should buy things at home. If I send $12. away for the plough I have $3. in my pocket, but if I give him the $15. and he sends away $12. for the very same plough, then he has $3. in his pocket.

When we first started people seemed to think our organization a joke, but they don't think so now, and we met with all kinds of opposition. In one instance, we bought our binder twine from the Belfast rope works, then three years ago we could not buy any more there and the Ontario people would not sell us a bit. We have done a business amounting to one million dollars. We have not made a great amount of money but that is not what we are for, we are there to benefit the farmers.

You must do business by capacity, that is the only way you can do it. Do not start on two small a scale, you are making the same mistake we did. Some time ago we had forty car loads of seeds on our hands and the farmers would not buy it from us. We wanted to sell it to the farmers, and so save them the extra expense. Of course the time came when we could not keep this seed on our hands any longer, so we had to sell it to the dealers—and the dealers sold it to the farmers.

The delegates at the convention elected the following officers; President—C. L. Smith, Woodstock; 1st Vice President—T. W. Caldwell, Florenceville; 2nd Vice President—A. Chapman, Pinder; Executive—Judson Corey, Kincardine; John Fulton, Wicklow; A. A. H. Margison, Centreville; Chas. R. Enman, Killowen and John Young, Glasgow. Auditor—Rennie Tracey, Centreville.

An evening meeting was held at the Fisher Memorial School at which the speakers were Messrs. Morrison and J. D. McKenna of the Maritime Farmer, Prof. Kierstead on behalf of the Food Controller and Mr. Balmain on behalf of the Y. M. C. A. Triangle Fund.

The following resolutions were unanimously adopted:—

1. Resolved that whereas under the present method of breaking winter roads, it often works out that in settlements where a large proportion of the ratepayers work in the lumber woods in winter, the breaking of the winter roads has to be done by the few without remuneration. Be it further resolved that the Provincial Public Works Department be requested to pay for the breaking open and snow plowing of all winter roads.

2.. Resolved that the United Farmers of New Brunswick at their annual meeting respectively call the attention of the Food Control Branch at Ottawa to the constant violation in all parts of New Brunswick of the law fixing the prices at which mill feeds must be sold, and demand that all dealers in Mill Feeds be licensed and compelled to sell at lawful prices. Subject to cancellation of said license for charging excess prices. .

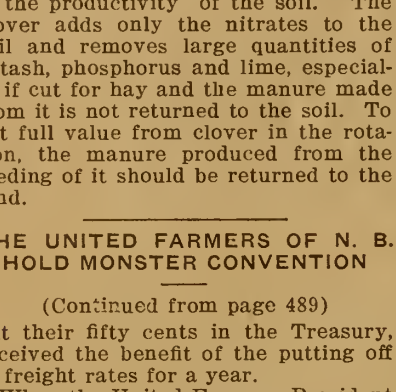
3. We, the United Farmers of New Brunswick wish to put ourselves on record as being heartily in accord with the movement for greater production in Canada the coming summer, but feel that the so-called daylight saving act will hinder, rather than promote the interest of Greater Production.

4. Whereas fully seventy-five per cent of the freight carried by the Railways of Canada are farm products and whereas the Railway Commission at present has no Agricultural representative, therefore resolved that this convention of U. F. N. B. recommend at the earliest opportunity the appointment of two experienced farmers on the Commission.

5. Whereas the Agricultural interests have not been represented by practical farmers in the Parliament of Canada to the extent of a proportionate representation and whereas the basic industry of Canada has not received that consideration it demands. Therefore resolved that this convention of U. F. N. B. nominate experienced farmers in every rural constituency in N. B. in future elections.

6. Whereas the live stock industry lies at the foundation of Agricultural progress and demands greater consideration, and whereas the shipment of live stock a distance of 400 miles to Montreal exacts a heavy toll in shipment. Therefore resolved that this convention of the United Farmers of New Brunswick recommend that at the earliest possible time an abbatoir be erected at St. John.

A further session was held on Wednesday morning the 24th inst., at which Mr. C. L. Smith of Woodstock was appointed as organizer for New Brunswick.



Conserve Your Health

CANADA needs her men in field and factory.

No one can afford to be too sick to work. Kidney trouble often keeps men ailing around the house, but

Dr. Wilson's HERBINE BITTERS

will quickly relieve pain in the back, take away the burning in bladder, restore healthy action to the kidneys, and make a tired, worn-out, pain-plagued man feel as if he had been born anew.

Dr. Wilson's Herbine Bitters are made from simple herbs and are Nature's own remedy for Kidney troubles, indigestion, constipation, bilious headaches, general rundown condition.

FOR SALE—Registered Yorkshire young pigs, mother raised on College Farm, Truro, $8.00 each.—G. K. COLDWELL, Wallbrook, Kings Co., N. S.

WANTED—MARRIED COUPLE to go on farm outside of Boston. Man to work on farm, and woman to do the cooking. Apply to R. CORRITTE, P. O. Box 968, St. John, N. B.

FOR SALE—Registered Ayrshire bull, No. 18032. Dam 31884 C.R.R. Also several registered bull calves.—E. CHADDECOTT, Monkham's Farm, West Merigornish, Pictou Co., N. S.

EGGS FOR HATCHING from choice stock, Houdans, White Wyandottes and Rose Comb Brown Leghorns. Eggs $1.50 per setting. C. C. Sweeny, Lunenburg, N. B. Box 413.

LADIES WANTED—TO DO PLAIN and light sewing at home; whoel or spare time; good pay; work sent any distance. Charges paid. Send stamp for particulars. National Manufacturing Company, Montreal.

HOLSTEINS FOR SALE—Five pure bred and several grade cows and heifers to freshen in April, May and June, also two pure bred bulls, one year old.—JOS. R. TAYLOR, Upper Dorchester, N. B.

I NEED ONE LADY OR GENTLEMEN in your vicinity to do a little special work. Good pay to the right person. Enclose stamped envelope for reply.—L. M. VINCENT, P. O. Box 617, St. John, N. B.

Percheron Stallion

Two-year-old stallion, pure bred and registered. A fine big boned promising young fellow. Sired by H. C. Jewett's "Gresham," who was never beaten as show animal in the Maritime Provinces.

ALBERT FLEMMING,

Truro, - - - N. S.

FOR SALE

Pure bred registered Percheron stallion, rising five years old. He is a first-class individual, a sure stock getter and will stand inspection anywhere. A bargain if taken at once.

A. S. HINGLEY,

Prince Str. House, Truro, N. S.

CLYDESDALE STALLIONS FOR SALE

I will sell either Baron's Own (Imp) No. 15282 seven years old, by Baron's Pride or Kelvin's Pride No. 16262, four years by Baron Kelvin. Baron's Own has been several times Champion at the leading Provincial Shows. Kelvin's Pride has also been a Champion. Apply to James Easton.

R. A. SNOWBALL, Prop.

Meadowbrook Stock Farm,

CHATHAM, - - - N. B.

URGENCY MEETING N. B. FARMERS ASSOCIATION, FREDERICTON, APRIL 26th.

(Continued from page 465)

es; to-day he has only one boy at home. He is a man with heart failure and liable to die at any time, he has from 12 to 15 cows, and what condition would that man be in if that boy were taken?

I have two boys in the trenches and have only one left. I believe we should do all we possibly can, even supposing they do take those boys. The Military Service Act is a good fair Act, but no doubt it was abused in some cases. There are two or three boys in our section who did not go, they had some pull and didn't have to go, but that is no fault of the Act at all.

It was moved and seconded that the following Resolutions, introduced by the Resolution Committee, be taken up, section by section, and discussed—

1. WHEREAS a proclamation has been issued by the Dominion Government, calling to the colors all young men of 20, 21 and 22 years, inclusive, and annulling all exemptions affecting farm labor.

Mr. Porter.

There should be some kind of a guarantee that the labor will be left on the farms. Boards were appointed, at a considerable expense, and the boys on farms exempted, now that order-in-council has been cancelled. The result will be, instead of increased production, reduced production. We do not wish to come out in opposition to the government, we feel patriotic in this cause. The war to-day requires the assistance of all civilized nations. The most efficient war correspondents claim that food will be a vital question and it may decide the result of the war. The Allied Powers have asked Canada for what? They have asked for food and munitions,—they have never asked for a man,—Canada has always volunteered and suffered and died and paid all the debt that can be paid. We have not been behind. For the small number of people that we have Canada has done well. Canada is noted the world over for what she has done. Yet the food production question come in, the Allies say they want food and if they have got to look to Canada and the U. S. for it, it is our part to get it. They can get food from Canada, when they cannot get it from Australia and other far off countries, and we as farmers have undertaken to produce that and for that reason have had our sons and laborers exempted, according to the provisions of the Act, and we have been building on that. Now the whole thing is struck out, and where will we be? I think it is our duty to-day to express our opinions plainly and emphatically on these points, so that the Government may understand what we require and what we think.

A young man in New Brunswick, a young man in Canada, a young man most anywhere is worth more to-day in deciding this war in favor of the Allies on the farm than anywhere else. If he is drafted now it will be a year before he can do anything overseas in the trenches. If we have not the help now, we simply cannot raise the food. I think it is vital that all laborers should be retained on the farms.

Mr. A. C. Fawcett.

Something seems to have gone wrong with the M. S. A. The Country was led to believe the farmers would be exempted,—I don't know what is wrong. This thing was apparently working along all right, now they come to the conclusion that the Act is no good. Whether that is the real reason or whether the manufacturers have more influence than the farmers, it is hard to know. They state there are men loafing around pool rooms and on street corners, still it is proposed to take away the farmers and have these men conscripted and put in the farmers' places. If these men are able-bodied and doing no particular work in Canada, why are the farmers taken away and these other young men put in their places?

T2E 1194 King Street W., - TORONTO

I think everyone knows the farmers are useful. It would take two of these men to do the work of one farmer. They all want the same pay and with the very limited crops, the high prices and unskilled people from cities on farms, it will mean the whole proposition will fall down and it will be an absolute failure in every particular, as the food will not and cannot be produced.

Section 2. WHEREAS the urgency of the food situation is such that every man in Canada is asked to produce certain staple food crops and cultivate five acres more than usual during the season 1918, that our Empire and her

FARM HELP AVAILABLE

25000 Older Canadian Boys Have Volunteered TO HELP THE FARMERS

Last year 7,000 Older Boys demonstrated to the farmers of Canada that they could help take the place of the regular farm help that has gone overseas.

They proved their willingness and ability to adapt themselves to farm work.

This year many farmers are asking for boys.

Already 25,000 boys between 15 and 19 years of age in Ontario and western Canada have offered their services as SOLDIERS OF THE SOIL. The enrollment week for New Brunswick takes place April 28th to May 4th. The plan is to have the boys fill in the enrollment forms which will be turned over to the Department of Agriculture.

The farmers are asked to write to the Minister of Agriculture stating what help they require and for what period.

Arrangements as to wages will be agreed upon by the farmer and the boy.

J. F. TWEEDDALE,
Minister for Agriculture.
Fredericton, N. B.

AGRICULTURAL RELIEF OF THE ALLIES

In February circulars and small envelopes were distributed throughout the province with a request that consideration be given to the farmers in Belgium, France and Serbia who have lost everything because they lived where the battles have been and are fought. The fund is to assist these men to re-establish when the war is over.

Dr. James W. Robertson of Ottawa, is in charge of the work in Canada and at his resuest the Provincial Department of Agriculture is urging that New Brunswick maintain her position among the provinces in Canada. This is only preparatory in order to prevent very heavy calls coming at the close of the war.

"The farming population of the British Empire who have not suffered are being invited to help their unfortunate brethren in allied countries who have lost everything in the common cause. They need seeds, live stock, agricultural machinery and tools to enable them to resume farming operations.

"Donations have been made of much needed agricultural implements and tools. The Germans in their retreat during the battle of the Marne gathered field implements in heaps and put bombs under them. They burned farmhouses wantonly as a deliberate part of their policy to leave the war area utterly desolate.

"Recently the Overseas Dominions have been invited to join in the work of relief. Thus the farmers of the whole British Empire will be able to render friendly and much needed help to the stricken farmers in the regions which have been devasted by the enemy. When the occupied territories of France, Belgium and Serbia have been cleared of the invaders the task of reconstructing will be too great for the peasants, who have lost everything except the land itself.

"We ought to help our stricken brethren as soon as the enemy is pushed out of their territories. We want to do that for several reasons. The object is humane and we are a humane people. They are our allies, our neighbors and our friends. We want to help them for the sake of the good name of Canada. It would be a good thing in our international relations, to have it known that the dairymen of Canada gave something a good thing to have it known that the grain growers gafe something, a good thing to have it known that the livestock men gave something, that our poultrymen and fruit growers have given something, and above all that onr country women have remembered their sistérs whose farm homes have to be re-established out of ruins. We want for Canada a place among the nations, on behalf of our farmers which will be in keeping with what our sons and brothers have done and won on the fields of battle."

Up-to-date less than $1,000.00 has been received by the Treasurer of the Fund, W. R. Reek, Fredericton. Agricultural Societies, if they have not already done so, would do well to consider this as organized bodies. Many perhaps did not receive envelopes but contributions will be welcome in any form.

Complete lists of subscription will be published shortly.

THE FARM WELL

Good water is as essntial as good food for the maintenance of health in the family and the thrift of the farm live stock. An ample supply of pure, wholesome water is not only a blessing of inestimable value, but one of the most valuable assets a farm can possess. There is no countiry in the world with a greater abundance of pure water in lakes, rivers and springs than Canada and there is no insuperable difficulty in the larger number of our agricultural districts in obtaining a supply ample and pure.

A glance through the Annual Reports of the Experimental Farms shows that the Division of Chemistry is doing a valuable work towards the improvement of the farm water supplies throughout the Dominion. In the course of the past thirty years many hundreds of samples from farm wells have been analysed and reported on. A perusal of these reports shows that year in and year out only about one third of the waters are pronounced as pure and wholesome, in other words, were free from excretal drainage matter. This is not as it should be and the reason is not hard to find. In too many instances convenience only has been considered in locating the well. For the most part we find these polluted wells under stables, in barn yards or dangerously near the privy or where the slops from the farm house are thrown out. Wells in such locations can never be depended on to yield pure water. They must sooner or later become polluted by filth draining into them from the surrounding soil, which inevitably becomes saturated with manurial products. These wells indeed act as cess pits and the records show not a few instances in

SANITONE
for the WALLS and CEILINGS

There are three features of "SANITONE" that appeal very strongly to the average woman.

1st.—She can Paint the walls herself; or have the home re-decorated with "SANITONE" by the local painter, at the minimum cost for labor.

2nd.—"SANITONE" walls are always fresh and clean, because the surface is washable; does not fade out or rub off.

3rd.—The many soft, rich tints—blending with any color scheme desired—enable the average woman to make her home refined and thoroughly artistic at very small cost.

For Furniture and Floors use C. P. SUN VARNISH STAINS, and where a high-gloss finish is desired, for inside use on wood-work, etc., use CANADA PAINT.

And we'll send you one of the most complete books ever written on the subject of Paints and Painting—"What, When and How To Paint", free on request.

DECORATIVE SERVICE FREE. Send for color schemes and suggestions for finishing any part of the exterior or interior of your building.

PEERLESS PERFECTION

No matter how fast it comes, the most unruly animal can't break through a *Peerless Perfection Farm Fence*—it springs back into shape.

Made of heavy Open Hearth steel galvanized wire with all the impurities taken out and all the strength and toughness left in. Every wire is crimped making the fence into one continuous spring. Top and bottom wires are extra heavy. Will not sag. Requires less posts than ordinary fence. Absolutely guaranteed.

Don't buy a rod of fencing until you get our illustrated Catalog. Describes our big line of farm, poultry and ornamental fencing. Also Peerless farm gates.

Agencies almost everywhere. Agents wanted in all unassigned territory.

The Banwell-Hoxie Wire Fence Company, Ltd.,
Winnipeg, Man. Hamilton, Ont.

which the water of such wells possessed a distinct fertilizing value from the presence of excretal matter.

The lesson from these facts is: don't sacrifice health to convenience, locate the well at a safe distance—50 to 100 yards at least—from any possible source of contamination. A bored or drilled well tapping a deep seated source, tightly sealed off at the junction of the soil and rock, is likely to give the purest supply. If a dug well, line it to a depth of 10 or 12 feet with concrete or puddled clay, 4 to 6 inches in thickness, to ensure the exclusion of water from the surface layers of soil. Keep the surroundings of the well absolutely clear from the accumulation of filth and preferably in the grass. Make provision to carry off the waste water from the pump, so that it may not re-enter the well and so protect the mouth of the well that surface water cannot flow in and mice, frogs, snakes, etc., are excluded. With wells such as these pure water may be secured. A wind-mill, gasolene engine or hand force pump will be found a paying investment, enabling the water to be piped to the house, stable and barn, thus securing running water in the farm buildings—a convenience and blessing that needs only to be experienced to be appreciated.

SHEEP BREEDDERS HAVE MANY WORRIES

Lucrative as the sheep industry may seem at the present time, I will venture to say that many flocks will not pay the ir shepherd a good profit. I have observed many times when neighbors met in the spring of the year, about the time they were getting their rewards for the care and attention they had rendered their pregnant ewes during the winter months, the question would arise in their conversation: "What fer luck yea havin' with lambs?" "Oh, bad luck, John I don't know what's the matter with my sheep. The lambs are so weak, they won't suck, and some of the ewes hain't got any milk and so far I've lost about two-thirds of the labms."

To this man sheep are not proltable and unless he is willing to conform himself to the care and management of the flock that will avoid such trou ble he had better dispose of his sheep. Many men are ogod feeders and care well for their stock, keeping a few sheep as a side line, with the idea that these animals require little or no attention, and because of a fleece on their backs they are expected to with stand all the cold rains and storms. To the writer it's a horrible scene to see a flock of sheep out in the open field, without any protection whatever, during a cold and freezing rain, or a severe snow storm. Men who would walk miles to save or gain a dollar often lose many dollars, because bringing their sheep to the barn, before they are in the habit of stabling their stock regular for winter feeding, would be too much trouble.

The writer admired sheep and started a flock when a boy about twenty-four years ago. In these years he has had both encouraging and discouraging experiences. We have possibly given more attention to sheep in these years than other live stock and in a measure have been successful. We do not pretend to know all about sheep now, but as we look back over the time of our experience we think of the many mistakes we made, the important things about caring for the flock we did not know, the many difficulties that arose, and why? There were in ternal an external parasites to figth and we had to learn how to prevent infection of these pests to keep the flock in a thrifty condition, and there are many other ills to which sheep are susceptible which we had to learn to diagnose. We had read how to do those things but sustained many losses that are now avoided because of some knoweldge gained by experience.

We always aimed to feed our breeding ewes sufficiently and perhaps overdid it sometimes. But an importani factor was at first neglected. In the winter months ewes were mostly confined to a lot adjoining their place of shelter or stable where they were fed. They had ample room to exercise if they cared to, but sheep will not walk around or away from the feeding place very much unless they are compelled to do so in search of food. Later we found it a little more trouble but by all means very profitable to hitch a horse to a sled and haul their morning feed to the field some distance from the barn. The sheep will follow the sled and the farther we can make them tramp the better they like it. They are always back to the barn for their evening feed of alfalfa and a little oat, and what appetites, and how they do relish the alfalfa.

An essential study which became very interesting was to learn something of the correct type of our breed, to be able to somewehre near judge the value of the breeding stock we purchased, as well as be sensible in pricing our stock for sale. And the object is not alone how many lambs we cna raise, but also how good and near the standard of perfection we can have them.—S. D. K. in O. N. J.

The most common cause of sheep losing their wool is a let down in the degree of condition or thrift of the sheep. If sheep have come into winter quarters in fairly good thrift, and the feed is of such a character that they will decrease to quite an extent in their degree of condition and thrift this will cause the wool to come off in spots, or even over a large area of the body. The combination of feed used is the biggest factor in sheep losing their wool. It is true of course that sheep will rub off some of their wool when they are very ticky or lousy. The loss of big spots of wool, however, is due to a weakening of the wool fibres. This has been brought on by a poorly nourished body.

Keeping sheep in too close and warm quarters during winter is another cause for wool falling off in spring months.

FRUIT PACKAGES

URGENCY MEETING OF N. B. FARMERS ASSOCIATION

(Continued from page 493)

about 50%.

Section 5. WHEREAS labor drawn from the cities cannot replace that taken from farms, particularly in the Province of New Brunswick.

Section 6. AND WHEREAS under the persuasive influence of representatives of the Dominion Food Control organization, vast preparation has been made by the farmers of New Brunswick along lines of greater production, thousands of dollars have already been invested in fertilizer, grain and preparatory work, which will to a great extent be a waste of enery and money, if the farmer has to submit to the severe handicap consequent on the enforcement of any order or act of Parliament affecting farm labor.

Mr. Fawcett.

In regard to the farmers being disloyal or not being prepared to do their duty in this important work,—it is not a case if we want to do the work,—but we can't do it. If they take away our efficient farm boys out of the country and help us out with conscripted boys from the town, they will fix it so that it will never pay. It is very hard to run a farm with a profit, when you have to hire help; it is very easy for a man with his boys and girls to make the farm pay. With hired help, inside and outside, a man cannot pay the interest on the capital.

Allies may be fed, and

Section 3. WHEREAS our farmers are prepared to faithfully fulfill their obligations and duties as British subjects in this respect, and

Section 4. WHEREAS in order to accomplish the desired results, efficient farm labor is necessary. (I do not think any are in favor of this section, so it is withdrawn).

Mr. Ashley George.

In Carleton County I have been around doing some organizing. The farmers are taken as kickers or as knockers, but I find throughout the Counties of York, Carleton and Victoria the farmers are really seriously concerned about the food situation; they are anxious that every acre should be sown and that everything should be done that could be done to increase production.

Prof. Robertson told us in Woodstock that unless there was 50% of an increase in production this year, it might be that they would have to stop the war on account of food. In consequence of these, and many other remarks the farmers are seriously concerned. We are not opposing the Empire, but we are so vitally concerned about the things of the Empire, and that is the reason we are here to-day.

A. H. Mersereau, Esq.

I attended a meeting of Prof. Robertson's and he said we were facing starvation, unless greater production was undertaken. The last few days there has been a great damper put on the work throughout our section. The boys going means that the farmers are going to cut down their production. Several farmers told me they would not employ outside help. If the past Government made a mistake in putting four divisions in the field, I do not think we should stand up and allow the boys to go starving to keep the divisions up to strength. I am simply stating that we have too many divisions at the front for a farming country. I think they should now let the States put their two or three millions in and we should be left to produce the food. The farmers in our section say they will do what they can themselves, which will mean a reduction of

C. L. Smith, Esq.

As you have already heard this afternoon, the Food Control Commission has got our men to go into farming on a more extensive scale—to buy fertilizer, to produce greatly increased crops—and now they are going to take our help away from us. Not only that, but they are going to save daylight for us. I want to say right here, I am a friend of Mr. Carvell's, I am a supporter of his, but I tell you he never gets up before 8 or 9 o'clock. You go to his office at 6 o'clock in the afternoon and he is never there,—but he says, "Let the farmers get up an hour earlier in the morning." Now, gentlemen, we are going to stand together like the paper men stood together, and like the farmers of Alberta and Saskatchewan stood together. Why, the Government fixed the price of wheat at $1.90 and the farmers of Alberta and Saskatchewan said, "You didn't fix the price of shells and munitions going over to Europe, one man made $700,000. excess profit, over and above a fair profit for making shells. You have got to guarantee the same prices for wheat as in the United States, $2.20." The farmers won there, because they were organized, and because they stood together, and the Government in Ottawa were afraid of the farmers.

How many farmers are on these various commissions? How many farmers are travelling over the country, getting good salaries for telling the farmers what to do, (and who are as well qualified to tell the farmers what to do as the farmers themselves)?

Again, the Railway Commission,—is there a farmer on it? The C. P. R. and the Canadian Northern and G. T. P. asked for increased freight rates. The farmers in the West got after the government and the Government was afraid. What did they do? They held it up and considered it and they passed a law that the railways would have to pay an excess over the earnings. The first meeting we had the Food Control informed us if the price of potatoes went above a certain figure, they would fix the price so that potatoes wouldn't go any higher. If the Maritime Province farmers weer organized, you could compel them to fix a price on potatoes, the same as the farmers accomplished in the West on the price of wheat.

Furnace Management
Ease of the Sunshine

Feeding the furnace;
—shaking down the ashes,
—removing the ashes,
—keeping the health-giving water pan filled,
—fixing the drafts for the night,
of the temper and destruction of your raiment any one of them may be.
—those are the five major operations in managing a furnace—and what a trial

If your furnace is the famous McClary Sunshine, these operations will cause you little more trouble or effort than winding up the clock.

The feed door of the Sunshine is big—you don't hit the side and damage your shovel and temper and scatter coal and naughty words all over the basement.

You don't shake the Sunshine grates, you merely rock them a few times,

—and the ashes drop from the perpendicular fire-box walls and grates and are guided into the big ash pan,

—and you lift the ash pan out with handles that are always cool.

—No shovelling of ashes—no ashdust on your clothes or in your hair or in the house.

And at night, without going down to the basement, you drop the damper and open the check with pulls that always work.

And the water pan is right above the fuel door—very accessible—in plain view, where you can't forget it.

Sunshine furnace management is not even exercise.

Engineering Service Free. McClary's own heating engineers are at your service when you buy a Sunshine Furnace, to give you free expert advice on your home-heating requirements. Write to the nearest McClary Branch and ask for particulars about this service. A Booklet "Comfort in the Home", makes clear all the things you want to know about furnaces, and it is sent free on request.

Sunshine
Furnace

London Toronto Montreal Winnipeg Vancouver
St. John, N. B. Calgary Hamilton Edmonton Saskatoon.

I hope we may accomplish something this afternoon. tI seems to me the men they are taking from France to England are to produce more there, and they are not going to look to Canada because they cannot get ships to take the food over. Because of that they are going to farm more extensively in England and they are taking the men from here. We should organize, as all labor is now organized, and stand shoulder-to-shoulder to help one another, instead of helping the politician, then we will not be begging the governments to do something for us. Election times the politicians come around and tell the farmers what fine fellows they are.

Section7. THEREFORE RESOLVED that we, the New Brunswick Farmers' and Dairymen's Association and United Farmers of New Brunswick in specian convention at Fredericton this 26th day of April, 1918, believing it to be in the best interests of the Allied Cause, humbly urge and request the Dominion Government that all efficient farmers, farm laborers and cheese and butter makers, who have and who will consistently devote their time to agriculture, to the satisfaction of their employers, during the seeding, growing and harvesting seasons, be allowed to remain upon the land, to prosecute the defence of the Empire in the second line trenches.

Moved by C. M. Shaw and seconded by J. T. Prescott, that a delegation be appointed to go to Ottawa and present this the resolutions passed to-day, and that similar organizations in Nova Scotia and Prince Edward Island, be wired of our action and requested to take similar action and co-operate with us. Carried.

Moved that the expenses of this delegation to Ottawa be paid jointly by the Farmers & Dairymen's Association and United Farmers of New Brunswick. Carried.

The delegates chosen were:—A. D. McCain, representing the United Farmers of New Brunswick; and L. M. Anderson, representing the Farmers & Dairymen's Association.

Under existing conditions, it was decided to hold no summer meeting this year.

Expressions of regret at inability to attend meeting received from Euclid Potvin and J. D. McKenna were read.

A vote of thanks was tendered the President for his work in calling the meeting.

The best asset a country can have is the farmer who can grow good calves to be better cows than ever he had before. .

FARMS FOR SALE !

1. Desirahle farm for sale, situated at Lower Gagetown, N. B., containing 100 acres or therehy, suitahle for growing all kinds of crops; there is a splendid orchard on the property, containing ahout 500 apple trees of good commercial varieties.

The farm huildings are commodious and exceptionally good and there is ample water supply. Puhlic wharf about one-half mile distant and railway runs through the property.

2. Farm with suitable house and huildings, situated ahout 3 1-2 miles from Gagetown, extending to ahout three hundred acres, ahout one hundred of which is good cropping land, the halance containing a large quantity of valuahle pulp and firewood.

Economical Substitutes in Swine Feeding

By G. B. Rothwell, B.S.A., Assistant Dominion Animal Husbandman

The present cost to produce a hog finished for the market, where maintenance, breeding and feeding charges for the dam are properly charged, and where a conservative percentage of the feeding and breeding costs is added to cover overhead charges and risk, would appear fromestimates at the Central Experimental Farm to average $20. A fair, but not excessive, profit should be possible with present pork prices where good management is applied.

The feed situation, however, is far from bright at the present time. Standard hog foods comprise but a short list—corn, barley, wheat by products, and oats. Corn has been practically in a limited way, but at a price almost prohibitive for fattening purposes. Barley is far from readily available, and at top-notch prices. Wheat by-products are now limited to shorts and bran. The former, possibly the most commonly used Canadian hog food, will be available, it is to be hoped, in fairly reliable quantities with no possibility of a surplus, and at a fixed price. Oats at present prices may be used with economy only to induce milk flow and the growth of bone anad sinew, i.e., with the milking sow anad the weaned pig. In short the whole matter of available hog foods rests upon an entirely unstable foundation. Are there avenues or relief?

The Use of Concentrated Substitutes for Cereal Grains

At the Central Experimental Farm durinig the past several years numerous concentrated by-products have been used in the experimental feeding of hogs. A complete resume of such work would be lengthy, and distinctly unprofitable in the present instance. It would be idle to contemplate the use of foods now off the market, or quite unreliable of supply.

Of the concentrates which may now be procured—in, however, limited quantities—cottonseed meal, gluten meal, gluten feed, linseed oil meal, distillers' grains, corn oilcake, and corn bran may be mentioned. Not any of the above concentrates may be listed as readily procurable.

Concentrates for Fattening

In 1915-16 and 1916-17, cottonseed meal, glutten feed, linseed oil meal, and distillers' grains were all shown to have high values for fattening purposes where these feeds entered into the mixtures in quantities depending upon their protein content. Briefly, in 1915-16 the following percentage additions to a basic corn, shorts, barley ration gave economical and healthful results,—glutten feed 20%, linseed oil meal 17%, and cottonseed meal 13%. The fololwing winter, a similar experiment showed the injurious effects (protein poisoning) of in creasing the percentage addition in the case of linseed and cotonseed meal. Wnere fed in the original percentages good results were obtained. Distillers' grains were further shown to give good results as a 20% per cent. addition.

Linseed oil meal may be safely fed as indicated, and is a concentrate to be recimmended at the present time. Gluten feed as high as 30% of the raGlutn feed as high as 30% of the ration is another valuable substitute where procurable. Cottonseed meal, while giving phenomenal results, should not be widely recommended as a hog food. Distillers' grains are becoming increasingly difficult to obtain. Corn oil cake (no experiments at Ottawa), where procurable, is a high-class concentrate fed with shorts or bran and skim-milk. Corn bran, of limited supply, may enter profitably into the ration of the brood sow, or the fattening hog. Not more than 20% should fed owing to the rather fibrous nature of the food. While more in the nature of a by-product, elevator screenings, graded as buckwheat screenings, has given consistently good results, a fact particularly worthy of note at the present time. In 1915, a ration of buckwheat screenings and skim milk proved about equal to a standard ration or corn shorts and oil cake, showing a value of $27.60 at prices then current. In 1918, in a series of experiments conducted in duplicate, buckwheat screenings and milk gave the highest gains in both first and duplicate lots. The addition of shorts, oil meal, and tankage, was aparently in no wise an improvement over the whole screenings.

The one thing to be remembered, however, is that the inferior grades of elevator screeninigs have been proved of little value for swine feeding (C.E.F. 1917).

Concentrates for the Young and Growing Pig

There is little room for deviation from acecpted practice in the feeding of young pigs. A bone building ration with low percentage fibre is necessary. Ease of digestibility is essential. Wheat middlings and skim milk while being taught to eat, with middlings, sifted oats, a little corn, and skim-milk after weaning, form excellent rations. Skim-milk is almost a necessity. To find a substitute, three years of experimental work have been carried on at Ottawa. Tankage, oil meal and skim milk pere the chief centres of interest. Briefly, tankage proved a poor substitute where it directly replaced skim-milk, both in quality of pigs and cost to produce. As an addition to a ration containing skim-milk, it showed consistencly inferior to oil meal. In fact, as has already been pointed out, no benefit could be seen in adding this expensive meat by-product to an already balanced ration. Thus, while skim-milk and corn or barley gave consistently marked results over corn, tankage, and water, it also showed a slight superiority over corn, tankage and milk for weaned pigs.

Tankage, however, may be regarded as a milk substitute. Best results have been obtained at Ottawa where pigs were weaned without milk by supplying the meal dry in a self-feeder part of which was partitioned off and filled with dry tankage. This was consumed as required. Water was, of course, supplied at all times. While experiments at Brandon in 1916, with the feeding of tankage to young pigs, show conspicucusly the value of skim-milk, the former stood in the light of a good substitute. Grain only produced gain at a cost of 9.8 cents; grain plus 16% tankage 7.1 cents, anad grain plus skim milk 6 cents. The pigs fed averaged 85 pounds in weight, as againist six to eiight weeks old weanlings of the Ottawa tests. It must be remembered, however, that the reputation for tankage has been gained largely through its use as a balance to corn, a grain that for the production of economical gainis must be fed with some protein suplement.

The Use of Soiling and Pasture Crops

Soiling Crops.—The use of green feed, cut and fed to hogs, while applicable in cases where a few hogs are kept has the following disadvantages: (1) It is wasteful—the hogs soil much of the material; (2) the feed when exposed to the sun becomes soft and unpalatable; (3) laborious, — nowadays the hog should largely feed himself. Nevertheless, in 1913, on a meal valuation of $28 per ton, green cut clover was worth $4.81 as a hog food, replacing one-sixth of the meal ration. In 1915, green cut rape was actually fed at a loss when added to the meal and milk ration. In 1916, gree cut alfalfa showed a value of $2.62 per ton. The beneficial effect of feeding clover and alfalfa to pen-fed hogs was very evident from a health standpoint.

The subject of pastures for the growing pig is receiving much attention at present. Owing to cramped quarters, little experimental evidence is available from Ottawa, and informatioin is largely gleaned from stations at Lacombe, Brandon and Lethbridge.

As a single pasture crop alfalfa would appear to be unexcelled. Rape has also given good results. Clover is almost equal to alfalfa, a significant fact, considering that the growing of red clover is wider spread, subject to fewer difficulties, and generally better understood than alfalfa. Heavy seedlings (3 to 3½ bushels per acre) of barley, oats or wheat have given excellent results. Of the cereals sown singly, barley has proven the best pasture crop. A mixture of barley, wheat, and oats, equal parts, has also been used sucessfully, later reports indicating, however, that the mixture is inferior to barley alone. As a commercial proposition, a summer pasture of alfalfa, clover, or a spring-sown grain or grain mixture will give cheap, home-grown self-harvested feed for growing pigs. Late summer and fall pasture should be suplied by rape. As to the stock-carrying capacity of the crops mentioned, an acre is conservatively shown to pasture from ten to fifteen hogs in growing season.

The economy of pasturing is strikingly shown in one experiment (Lacombe), where the cost per hundred pounds gain in paddock feeding was $5.30. The average cost to produce with six crops mentioned was $3.54.

Vegetables, orchard, and garden refuse have a certain value as hog food, and, while no actual data is available, such material is carefully collected, and affords a healthful and more or less efficient meal saving food for breeding stock and growing pigs. It should be emphatically pointed out that, it has been clearly demonstrated that the use of the above food should not be forced too heavily upon the pig under three months. For the weaniing, a ration light in fibre is essential.

Milk Products as Substitutes for Meal

Skim-milk for the growing hog may rightly be claimed as the best single food. The common statement that with meal at $20 per ton, skim-milk is worth 20 cents per cwt. is all too conservative. oFr light, growing hogs, 60 pounds and over, 400 pounds skim-milk has showed equal on the average to 100 pounds meal, which at present prices gives milk a meal equivalent value of 63 cents. While the above may be taken as an average, experiments too numerous to mention specifically have shown that for the young growing hog, skim-milk at pre-war prices for meal ($25 to $28) showed values ranging from 28 cents with heavier hogs, to 79 cents for lighter individuals.

Buttermilk, fed fresh, wherever comparison has been possibre, is the equal of skim-milk. Whey is not generally procurable on the Farm system. While not regarded as valuable to the same extent as either of the two previous products, reports from Lacombe in 1917 show 100 pounds fresh whey capable of saving 19.2 pounds meal, or attaining a value of almost 20 cents per cwt. with meal at $20 per ton. Much of the palatability and consequent value of whey, is frequently lost through feeding it in a badly soured or desomposed state. Of all milk products it may generally be stated that the value of whey is least appreciated. At the present time it is possibly the only one wasted to any extent., and particular stress should be laid upon its value as a meal substitute, fed sweet and fresh.

Skim-milk must not be over-fed, however, for most economical returns. A small proportion of skim-milk fed shows a high meal equivalent. Much

(Continued on page 509)

Cutworms and Their Control

Injurious insects wage a heavy toll on farmers, fruit growers, and gardeners. The annual loss from such pests amounts to many millions of dollars. Among the destructive insects, the cutworms are insidious enemies which necessitate prompt warfare if we would save the enormous quantity of food-producing plants which they destroy every year.

In general, cutworms are similar in appearance, being smooth, cylindrical caterpillars, abotu one inch or more in length, and in colour of some dull shade similar to the ground in which they hide during the day.

The moths, which lay the eggs from which the cutworms develop, are of a grayish or dull brownish colour, and measure with the wins spread, from about an inch to two inches in width. When at rest the wings lie folded over the body. Being nocturnal in habit they are seldom seen during the day time, but in the early evening they appear in search of the nectar of flowers. The eggs laid by these moths are pale in colour, dome-shaped, and less than one twenty-fifth of an inch in diameter. They are deposited in clusters or masses on the leaves of trees, shrubs, weeds, grasses, etc., and some kinds even lay their eggs on the soil. They are chiefly active in June, July and August.

Injury by cutworms is mostly in spring when plants are young and succulent, but there are a few species which occur in destructive numbers as late as the middle of summer. As a rule, however, cutworm injury ceases before the end of June. As their popular name indicates, these caterpillars have the habit of cutting off the plants during the night, near the surface of the ground or a little below it. When they are present in numbers, in a garden or field, the plants will soon be seen to have been cut, or eaten off, and if an examination is made, the cutworm will most likely be discovered in the soil, coiled up, and just below the surface. Not all cutworms, however, feed in this manner; some climb up into fruit trees or such plants as currants, gooseberries, tomatoes, etc., and feed upon the foliage or upon the fruit. In fact, when they are excessively abundant, they will attack anything green and juicy. In such years some kinds assume the marching habit, so characteristic of the army-worm.

Methods of Controlling Cutworms.

Preventive Measures.

Clean Cultivation.—The eggs of most of our cutworm moths are deposited soon after the adult insects appear in early or midsummer. As they are laid on weeds, or other nearby succulent vegetation or upon the soil or the remnants of crops, it is most advisable to plough deeply, in the early fall, all fields where cutworms have been troublesome. Such clean cultivation not only destroys many of the eggs and the young hibernating cutworms, but also numbers of other insects which winter beneath fallen plants, refuse, etc. Fall ploughing should always be practised where circumstances will permit, not only for the destruction of hibernating insects, but also because the land will be put into better condition for early spring sowing. In gardens and orchards, all remnants of crops, or other refuse, should be carefully gathered together and destroyed by burning.

Protective Bands.—In fields or gardens where such plants as cabbages, cauliflowers, tomatoes, etc., are set out, protection against cutworm attack can be had by placing a band of tin, or wrapping a piece of paper, around the stem of each plant at the time of setting out. Tin, of course, lasts longer than paper and is, therefore, to be preferred. Pieces about 6 inches long and 2½ inches wide are sufficiently large for this purpose, and can easily be made itno a cylindrical shape by bending them around a broom handle. Old tomato or other tins, in which canned vegetables have been prepared, are useful for this purpose, and if thrown into a bonfire the tops and bottoms fall off, leaving the central piece of tin which, if cut down the middle, will be sufficient for protecting two plants. When paper is used, cut this into pieces about three inches square. The pieces may be threaded on to a loop of string, which may be tied to the box in which plants, such as cabbage and cauliflower, are taken to the field. About two inches of the paper should be left above ground.

To protect fruit and other trees from climbing cutworms, a band of cotton batting four inches in width may be fastened tightly around the tree near the bottom. The wire or strong string holding the cotton batting should be placed near the lower edge, so that the upper patr of the band can be hung down, thus forming a sort of funnel, or cone-shaped mass of batting. Bands of tree tangle-foot are also useful in preventing the caterpillars from gaining access to the foliage, etc., of treesfi

Remedial Measures.

Poisoned Bait.—The poisoned-bran remedy is the one which is now used most extensively for the destruction of cutworms generally. This is made as follows:—

Bran	20 pounds
Molasses	1 quart.
Paris green, or white arsenic	½ pound
Water	2 or 2½ gallons

Mix the bran and Paris green (or white arsenic) thoroughly in a wash tub, while dry. Dissolve the molasses in the water and wet the bran and poison with the same, stirring well so as to dampen the bran thoroughly.

Shorts or middlings in place of bran are also useful for cutworm control.

A simple formula for small garden is one quart of bran, one teaspoonful of Paris green, and one tablespoonful of molasses, with sufficient water to moisten the bran.

The mixture should be applied thinly as soon as cutworm injury is noticed. It is important, too, that the mixture be scattered aften sundown, so that it will be in the very best condition when the cutworms come out to feed at night. This material is very attractive to them, and when they crawl about in search of food they will eat it in preference to the growing vegetation. If the mixture is put out during a warm day, it soon becomes dry, and is not, of course, as attractive to the cutworms. In treating fields of hoed crops, such as beets, turnips, etc., a simple method is to have a sack filled with the bran hung around the neck, and by walking between two rows, and using both hands, the mixture may be scattered along the row on either side. When cutworms are so numerous as to assume the walking habit, the poisoned bran may be spread just ahead of their line of march. In ardens, where vegetables or flowering plants are to be protected, a small quantity of the material may be put around, but not touching, each plant. Fruit trees may be protected from climbing cutworms in the same way, but the mixture should, of course, not be thrown in quantity against the base of the tree, otherwise injury may result from the possible burning effect of the Paris green.

Under field conditions, 20 pounds of poisoned bran is sufficient to treat about 3 acres. Scattering the mixture thinly places it where it will reach the greatest number of cutworms, and when thus spread there is no danger of birds, poultry or ilve stock being poisoned.

Observations have shown that the cutworm moths very often lay their eggs on weeds, etc., on the higher elevations in fields, and that the young cutworms migrate therefrom to other parts. If such places are watched from time to time in spring, it may frequently, be possibel to control the outbreak by scattering the poisoned bait chiefly within such areas.

Fresh bundles of any succulent weed, grass, clover, or other tender vegetation, which have been dipped in to a strong solution of Paris green (one ounce of Paris green to a pail of water), may be placed at short distances apart in an infested field, or between rows of vegetables, or roots, and will attract many cutworms and protect the crops from further injury. In Alberta the common weed known as Stinkweed has been successfully used. The bundles, also, should be put out after sundown, so that the plants will not be too withered before the cutworms find them. As in the case of the poisoned bran, they should be applied just as soon as the presence of cut-worms is detected.

The above poisoned baits have given excellent results for surface-feeding cutworms, such as the Red-backed cutworm, the striped cutworm, etc. For those kinds, however, as the Glassy cutworm, which feeds almost entirely underground, these baits are, of course, of little value. For such cutworms it is important to keep the land to be used for grain crops teh following year as free as possible from long grass and weeds. If this is done, there will be no tall vegetation to attract the female moths for the purpose of egg-laying.

Furrows or Ditches.—As a rule, when cutworms assume the marching habit, they are nearly full-grown and, of course, are very ravenous. In such instances, applications of poisoned bran have been extremely useful in stopping the attack. Severe outbreaks may also be largely controlled by ploughing deep furrows in advance of the line of march of the cutworms. The progress of the caterpillars is thus stopped, and when a furrow is entered by them, a log drawn by a horse may be dragged through it and the cutworms in this way will be crushed and killed. If a series of post holes about a foot deep and about 15 feet apart are dug in the furrow, hundreds of the cutworms will fall into them, and they can then be easily killed by crushing them with the blunt end of a post, or a piece of fence rail.

Handpicking.—In small gardens, as soon as injury is noticed, the cutworms can, as a rule, be easily located in the soil, about an inch or so beneath the surface, and within a radius of a few inches of the plant, and destroyed by hand.

The Manurial Value of Clover

(Experimental Farms Note)

The amount of semi-decomposed vegetable matter or humus present in our cultivated soils—sandy and clay loams—bears an intimate relation to their productive capacity.

Humus not only fulfils the mechanical function of rendering soils porous and more retentive of moisture, but furnishes also the essential medium for the activities of the bacteria which liberates plant food in the soil. Furthermore, humus constitutes the chief natural source of the soil's nitrogen supply.

Applications of barnyard manure may be considered the chief means employed in the maintenance of humus in the soil. Supplementary means are the growing and ploughing in of a green cover-crop such as rye, buckwheat, rape, vetches or clover. Of these, clover—where conditions are conductive to its satisfactory growth—is to be generally perferred. By means of its deeply ramifying roots, clover disintegrates and aerates the lower soil layers and brings up therefrom plant food supplies unattainabel by other more shallow rooted crops.

An additional advantage which clover, in common with all members of the legume family, possesses it that of its ability to assimilate the free nitrogen of the soil atmosphere by means of minute bacterial organisms living and operating in small nodules on its roots. Thus clover gathers the greater part of its nitrogen from the air, and its phosphoris acid, potash and lime largely from soil depths beyond the reach of the roots of ordinary crops, consequently enriching the surfac esoil with these constituents for the benefit of suceeeding crops.

How does clover compare with manure as a fertilizer? Barnyard manure of good average quality contains approximately 10 pounds nitrogen, 5 younds phosphoris acid and 10 pounds potash per ton. Therefore 10 tons of barnyard manure would furnish about 100 pounds nitrogen, 50 pounds phosphoric acid and 100 pounds potash.

Experiments conducted at the Central Experimental Farm, Ottawa, have shown that a vigorous crop of clover will contain, at a moderate estimate, in its foliage and roots, from 100 to 150 pounds nitroen, 30 to 45 pounds phosphoric acid and 85 to 115 pounds potash per acre.

A good crop of clover from one acre if it were turned under may, therefore, be deemed equal, in fertilizing value, to an application of ten tons of barnyard manure.

In the experiments referred to, 10 pounds per acre of common red clover was seeded down with various grain crops, while adjoining plots were seeded with grain alone. In no instance did the growth of clover depress the yield of grain with which it was seeded.

In the following year, fodder corn (Leaming) produced 8 tons, 480 pounds more after wheat with clover than after wheat without clover. After barley and oats, increases of 11 tons, 1280 pounds and 5 tons, 1440 pounds respectively, of corn, per acre, were obtained on the clover plots.

With potatoes the results were equally striking. After wheat, barley and oats with clover the increases were, respectively, 43 bushels, 20 pounds; 29 bushels 40 pounds and 24 bushels of potatoes, per acre, as compared with the yields from adjoining plots without clover.

The full benefits from clover will as a rule be noticeably persistent for several years.

On soils which are deficient in lime, a satisfactory growth of clover will be encouraged by an application of, say, two tons of ground limestone per acre. As a phosphatic fertilizer, designed to benefit both the grain and the clover, 300 pounds of superphosphate or 500 pounds of basic slag, per acre, may be recommended.

Unleached wood ashes contain, on an average, from 4 to 6 per cent of potash, about 2 per cent of phosphoric acid and from 20 to 30 per cent of lime. They are eminently suitable as a fertilizer for clover and, when procurable at a reasonable rate, should be applied at the rate of from 25 to 40 bushels (1000 to 1600 pounds) per acre.

Always use sufficient litter in the buildings to absorb all the liquid manure, the most valable portion as regards both nitrogen and potash. Air-dried muck and peat are useful as absorbents that can be employed to supplement the straw or sawdust beddings, if the supply of these is sort.

Will it Pay to Spray in 1918

The above question is agitating the minds of many apple growers at the present time.

The prospects are that some of the sections that Nova Scotia supplied with apples in 1917, will themselves have a moderate crop for their own use in 1918. It is more than probable that the major portion of this crop will be of poor quality if the season is in any way normal for the development of apple scab.

The paramount question in many minds is the question of price in 1918. Although we do not consider that the question of price for 1918 should be the dominant factor in influencing us to or not to spray in 1918, let us examine the point for what it is worth. What do we know about the 1918 price? In 1916 people expected normal prices for potatoes when they dug the crop, before the next spring many potatoes were sold for around $8 per barrel. In 1917 people xpected high prices for potatoes and many growers sold in the field for $4 per barrel, today anq quantity of potatoes can be bought for $1.50 per barrel and less. In July, 1917, many farmers cut their hay not expecting to be able to dispose of it in 1917-18 for the cost of gathering. In November, 1917, many lots of hay sold for $7 per ton loose. Within the past week hay has sold from the barn in the same districts for $19 per ton. In 1914 the general talk was "Apples will bring nothing" yet we got fair prices. In 1915 the talk was even worse and we got better prices. In 1916 the talk was that apples would scarcely be worth picking, and we got better prices than ever. In 1917 many expected low prices for apples during the sprinig and summer, but when the crop outside became known and outside buyers came to the country, expectations were changed, everyone looked for higher prices. With strange buyers bidding against each other in new territory for fruit, with which they were not familiar, prices were forced too high and apples were not consumed as they should have been early in the season. As Messrs. Gray and Vroom express it, the price nailed the barrel too tightly to the warehouse floor, it prevented apples from moving and apples were consumed by the classes only and not by the masses. The result was, apples moving too late or out of season the year through, a glut at the end of the season and a slump in prices which is causing untold loss to both growers and speculators. What does anyone know as to the price of apples in 1918? We know the quality of apples consumed by a given number of people fluctuates most widely and is influenced almost wholly by price so we can rest assured that if the price is low, say one half that of October, 1917, apples will be used as a food and not a luxury, that they will be consumed by the masses as well as the classes and the consumption will be enormous.

We expect that the quality of apples produced in many sections will be below normal. In order to keep well and sell best we must have our quality as high as possible. It has been amply demonstrated in the past that spraying and the growing of clean fruit pays even better in the years of large crops than in those of small crops for good quality apples have some chance of good prices in years of plenty while poor quality apples have practically no chance in such years. Aside from the possibility, which every man must judge for himself, of our marketing part or all of our 1918 crop in our normal market, London, the most important consideration is the effect of straying or not spraying on the crop of 1919. We know and are able to state definitely that in Nova Scotia the greatest benefit from spraying comes from increasing the crop the year following the application of the spray. If we are to get a good set of apples we must have strong fruit spurs and buds, to get them the leaves must be retained late the previous season, and in ordr to get the leaves to stay on late, we must keep them free from fungus diseases by spraying. This is absolutely the most important consideration in spraying in Nova Scotia, and by neglecting spraying in 1918 we are, if the season is at all normal, insuring a smaller crop or a failure for 1919.

We know the demand and need for other foods than apples and all will make the greatest efforts to produce potatoes, beans, grain, etc. We know that there is a labor shortage, but the spray gun amounts to more than saving a man in spraying. We know that our apples if not sprayed, will, according to Prof. Blairs' figures, cost us about $2.50 per barrel tree run on the average. Spraying costs about 20 cents per barrel, would anyone put the difference in value between tree run sprayed apples and tree run unsprayed apples as low as eight per cent? We think not. The orchards of the Annapolis Valley have been termed by Prof. M. Cumming as the big permanent asset of the valley. We know that our orchards, taking the section as a whole, are probably in better shape than any others in America, on account of ours having been cared for during the past three years, while other sections neglected their orchards to a greater or less extent. We expect to be paid for this care by having when peace is declared, orchards in good condition and producing good fruit. Can we aoffrd to lose all of this advantage by neglect in 1918?

We must grow all of the grains and vegetables possible, but for our economic future we must also keep our big permanent asset our apple orchards from depreciating. We do not want the same kind of a crop in 1919 that Ontario had in 1917. Apple scab and neglect of spraying in 1916 spoiled the Ontario apple crop in 1917.—By G. E. Sanders, Dominion Entomological Laboratory, Annapolis Royal, N. S.

United Farmers Receive Replies to Resolutions

The following replies have been received to Resolutions passed at the Agricultural Societies United which was held at Woodstock on April 23rd and 24th. They speak for themselves.

May 7th, 1918.

Dear Sir:—

Re prices of feeds and overstock of flour.

We thank you for your copy of resolution passed by the United Farmers of New Brunswick at their annual meeting, calling attention of the Canada Food Board to the violation of their order fixing the price of feeds and we are pleased to advise the United Farmers that the order bringing all retail dealers of flour and feeds under license is now operative and that the order bringing all wholesale dealers and brokers and commission men handling flour and feeds is operativie June 1st.

We are further pleased to advise all surplus flour over and above specified requirements must be returned through the channels specified by May 15th, or such surplus may be seized by the Canada Food Board thereafter. The regulation provides the following: for consumers living in towns, villages and within two miles of licensed dealers, (all dealers must secure license to remain in business legally) 15 days supply. Consumers living more than two miles and less than five miles, 30 days supply, and those living more than five miles and less than ten miles 60 days supply, those livinig more than ten miles from a licensed dealer may have 120 days supply on hand.

Apply to dealers: all dealers both retail and wholesale in flour and feed shall have not more than 60 days supply of flour on hand at any one time. The method of enforcing regulations is as follows: Consumers having an overstock of flour which they have had to purchase in order to secure feed, or have bought with hoarding intent, must return this to the dealer from whom they purchased it, retaining only their legal requirements as specified above. The dealer who takes this shall pay for it at the price which he received for it or the price for which he was selling just such flour at April 20th, whichever charge is the lower. When the dealer finds he is overstocked his redress lies in his returning the flour to the mill that supplied him, and his procedure is to notify the Millers Committee, 178 Queen Street, Ottawa, of the amount of flour he has on hand above his ordinary 60 days requirements, giving the packages and brands of same, and the Millers Committee will at once arrange with the mill to take this flour back and the price the dealer will receive from the miller will be either the price that he paid for the flour, or the price the miller would have charged him for the same brand of flour at April 20th, whichever is toe lower.

We trust we have made this matter clear to you, if not please adviise us.

Yours faithfully,
CANADA FOOD BOARD.

Controlling Potato Disease From the Start

(Experimental Farms Note

Potatoes are plentiful this spring. Procure your seed from a field which produced a good heavy crop the previous year. The smooth appearance of the seed alone is no guarantee of a heavy crop. Disinfect the potatoes before cutting the seed. Soak them for three hours in a barrel containing either of the following solutions:—

Corrosive sublimate: 2 oz. in 25 gallons of water. (Note: fatal poison to man and beast.)

Formalin: 1 pint in 25 gallons of water.

In cutting for sets, throw out all potatoes showing rot or brown spots, or rings near the stem end and in the flesh.

Cut the seed immediately before planting. The longer you keep them cut, the smaller the yield. Be prepared to meet the ravages of the potato bug. Spray your potatoes. Spraying pays! Use poisoned Bordeaux mixture. The poison for the bug, the Bordeaux for Late Blight. This is the solution:—6 lbs. bluestone, 4 lbs. lime, 40 gallons water. Dissolve bluestone first in 15 gallons of water. Slake the lime in another vessel, strain it if lumpy. Pour both solutions together and make up to 40 gallons by adding water. Add arsenate of lead paste, 2 to 3 lbs. per 40 gallons of solution; or use 8 oz. Paris Green and 1½ lbs. of arsenate of lead for 40 gallons solution. Stir well, and fill pump through fine meshed sieve. Particles will clog nozzles and are most annoying. Spray thoroughly, and cover all leaves well with spray. Don't drench. Commence as soon as the plants are a few inches high and continue every two weeks throughout the season.

For a large field use a high pressure horse-power outfit. For smaller areas, there are many good hand-sprayers on the market.

Get your spray chemicals right away and arrange for the purchase of a sprayer; sometimes it is a good practice for several farmers to club together and buy a good power sprayer.

Watch the field, and throw out any sickly-looking or dying individual plants. Mark the one hundred best hills for future seed uspply. From these select 80 which yield the largest number of uniform potatoes and plant these separately next year, and increase this practice until your strain yields highest in the neighbourhood.

Spraying

(Experimental Farms Note)

Unless many kinds of both useful and ornamental plants are protected from injurious insects and fungous diseases by spraying, the loss in fruit and vegetable crops may be very great, and, in the case of ornamental plants which would otherwise have attractive foliage and bloom, they may be rendered very unsightly.

The spraying of fruit trees should be begun just after the buds have broken in the spring and repeated at the times recommended in the spray calendars and pamphlets which are issued by both Federals and Provincial Governments and in which is given information in regard to the treatment of the different kinds of insects and diseases most likely to cause damage.

The apple scab causes, perhaps, more loss than any other plant disease in Canada, yet this can be controlled and clean fruit obtained, by thorough spraying with either Bordeaux mixture or Lime Sulphur. Other diseases and insects can be kept well under control also by the spray which has been found best for each.

Spraying is a rather expensive operation and it should be done in an intelligent manner, otherwise it may be wasted money. For instance, if the spray to kill the codling moth, which affects the apple, is not applied within a very few days afther the flowers fall, the sepals or lobes of the calyx will have closed over the opening or "calyx cup" in the end of the apple into which it is important to spray the poison. As it is in the "calyx cup" where most of the insects begin work, they are not likely to be poisoned if spraying is delayed and the apples will be wormy. A spray mixture or solution which will control one insect or disease may be of little or no use in controlling another. Arsenical poisons are the best for biting insects, while soap or tobacco sprays are best for those which suck their food and which have to be killed by contact, and certain sprays intended to kill insects will not control fungous diseases.

RECEIPTS FOR FARMER SUBSCRIPTIONS

The Maritime Farmer, instead of giving you one receipt in the year for a paid subscription, sends you 24, or one every two weeks. You will find it on the GREEN COLORED LABEL on which your address appears. The date printed thereon is that on which your subscription terminates. If on payment of your subscription the date is not changed within two weeks, please notify us. No other receipt will be sent.

MAY 28, 1918

DATES OF ISSUE

June 11-25

The New Brunswick Potato Growers Association has arranged for their annual summer field crop contests to take place again this year, ie,—(1918). Everyone that is interested in the Potato Industry, and who wish to see the industry advanced and developed, not only as to quantities that are being produced but, as to quality as well, should become members of this Association. Potato growers and all commercially interested in potato production, within the Province, are eligible for membership to this organization, by the payment of one dollar ($1.00) annual dues, to the Secretary. By joining this association, one is eligable to enter in the summer field crop contests, the annual winter show, which will be held on January 8 and 9, 1919, and in connection with this will be held, the regular annual Convention at which the different phases of the production of this important crop, will be discussed, and lectures will be given on the following subjects, viz,—improved methods of cultivation, suitable varieties, seed improvement, grading and standardizing, marketing, eradicating and controlling fungus and insect diseases, by the best authorities in America.

Farmer—join this organization now and help to further the good work that it is trying to accomplish, and by so doing boost your own Province and keep up the good name of N. B. for producing first class potatoes. Entry forms will be supplied by writing the Secretary, A. C. Taylor, Woodstock, N. B.

* * *

Have you good pasture for the sows and litters? Clover, rape and young rye are excellent for this purpose.

THE MILITARY SERVICE ACT

Possibly no branch of industry in this country has been more seriously effected by a War measure than the farmers of Canada under the new provisions of the Military Service Act. Thousands of farmers had prepared for increased production, yet without a moments notice the help of some of the best farms in Canada have been taken for Active Service. Farmer's organizations have protested to Ottawa, but the Government has explained that the need for men at the front is more pronounced than the need of Greater Production at home. However, the situation itself suggests this, that Canadian resources for prosecuting the War have not been as highly organized as might be expected from the amount of newspaper chatter that has been inflicted upon the residents of the Dominion during the past few years. We have heard of the organization of this branch of Canadian industry and of that section of endeavor, but when the showdown came in the enforcement of the somewhat drastic amendments to the Military Service Act, it found two of the most important departments in the Dominion Government's service engaged in a strenuous tug of war. The Department of Agriculture had been appealing for several years for increased production. Thousands of farmers in all parts of Canada had collectively invested millions of dollars in preparing to assist the Department of Agriculture and Food Control rBanch in providing increased food stuffs. Then the Militia Department kicks over the milk, and the result is that the farmers of this country are in a quandry as to what they should do. Of course the majority of them will put their shoulder to the wheel and see that their own boys are provided with food, but the whole incident suggests, and strongly suggests, the need for co-ordination in Government action. The Department of Militia should be pulling with the Department of Agriculture and not away from it. Surely after four years, the heads of the Government of Canada have learned a few lessons. If the farmers are really needed at the front, and that view must be accepted in war times, then in Heaven's name let us see that the resources of this country are really organized, and that real service is given by every branch of Canadian industry. The time for grafting, the time for loafing, the time for multi-millionaires and that sort of thing has gone by. Political crooks should be dealt with as they are being dealt with in France, by a firing squad with their backs to the wall. The farmers are having their affairs cleaned up, so let us devote a little time to some of the other industries.

THE MILL FEED SITUATION

The Maritime Farmer would again impress upon its readers the necessity for providing against the shortage in the supply of mill feeds in 1918. A review of the feed situation emphasis the wisdom of taking delivery of all available feeds in June and July. If you can get bran or shorts in these months take them. Later it will be impossible to get anything in the way of mill feeds before the Western crop is available and then the outlook will be attended by grave uncertainty. The Maritime Farmer is prepared to act as Agent for Agricultural Societies which require feed, but we would again point out that unless definite orders, accompanied by an undertaking on the part of a chartered Bank to protect drafts for goods are filed with us by June 15th, the Farmer will not undertake to assume any responsibility for the filling of orders. It is poor policy to wait until November and December when railways will be tied up with war transport and then complain because feeds cannot be procured. Complaining never accomplished anything, and we would suggest that if action is to be taken it be taken at once. If you are interested write the Martiime Farmer.

* * *

Good bulls are scarce; don't part too quickly with the proven sire.

HOME DEFENCE OFFICERS STILL EMPLOYED

Halifax can still boast of many Home Defence Officers. There are among them, men who have been engaged in discharging Military duties in that City since August, 1914. Their wives have been drawing Separation Allowance, they have had automobiles and chauffeurs placed at their disposal, and unless conditions have changed, they have used men from the farms of Canada to perform various menial duties about their homes. These men have been held up to ridicule from one end of Canada to the other. It was suggested to a former Government, that their services be dispensed with and their places taken by men who had seen actual warfare. However, this was not done. After the Union Government assumed office, not a few of those Safety First Heroes were displaced by returned officers. However, there are still glaring instances where men of this stamp are still retained.

With the Military Service Act taking the last man from many of the farms in Canada, and with new taxes being imposed on this country, and the third Victory Bond issue about to be launched, the Government must make up its mind that the services of these men must be dispensed with, or it will sell fewer Victory Bonds. People are tiring of the spectacle of Hot House Officers. We have had altogether too many of them in this Country, and every officer should have an opportunity of going overseas or he should be dismissed ignominously from the service. The Maritime Farmer proposes to have something further to say on this subject in the near future.

Have you all the farm labor you require? If not, why not get in touch with some of the "Soldiers of the Soil" in one of your nearby towns. A strong, willing boy of the teen age, if properly used and handled, will get over a lot of work and do it well.

* * *

The best place for manure is on the soil; the second best place is on the soil, distributed as uniformly as possible. A manure spreader earns its cost in a few seasons in saving labor and doing more effective work.

* * *

Fertilizing materials are high in price and difficult to procure. The range of chemicals customarily purchased as plant food requirements, have gradually narrowed down since the war began in 1914, until today there are very few materials from which a choice can be made.

Serious as the condition is at the present time, it is quite possible that it will be more difficult than ever to procure supplies for 1919.

It behooves every farmer to plan for the conservation of all classes of farm yard manures and other fertilizing materials that may be procured locally.

Plan to place your orders for chemicals early in the season. It is the only way whereby you can be reasonably sure of getting them in good season, providing they are at all procurable.

* * *

Save the good calves for breeding. Good dairy cows will be high in value for many years to come.

* * *

Are you making plans for the green food crop to tide over the short dry pastures of midsummer and early fall? Mixed peas and oats, and clover tention should be paid tothe growing of roots,

* * *

Now that middlings, bran and other feeds are high in price and almost impossible to procure in sufficient quantities to fill the demand, more attention should be paid to the growing or roots and peas and oats. Several farmers of our acquaintance, who grow large quantities of oats and peas, and who crush these grains for their live stock, do not worry a great deal about the scarcity of mill feeds and incidentally save handsome sums of money that would otherwise be sent out of the province.

ECONOMICAL SUBSTITUTES IN SWINE FEEDING

(Continued from page 505)

valuable feed is not only wasted, but lost with disaster to the pig as well, from over-feeding skim-milk. A study of experimental evidence would show that for the best results with young pigs, 1 pound of milk to 2.5 or 3 pounds of meal should be fed. A greater proportion of milk shows a decreased value as a meal substitute. For older hogs less milk may be used, tests and general observation at Ottawa indicating that for the 100 pound hog and over not more than 5 pounds should be fed daily.

Practice has idicated the advisability of feeding milk sweet to very young pigs. As the digestive system becomes stronger, however, comparison shows little difference in the results of feeding sweet or soured milk provided whatever condition favored is uniformly kept up, i.e. milk always swect or always sour. Sour milk is certainly easy to obtain, and would also seem to have a beneficial action upon the digestive apparatus not seen with the sweet product. Best results with whey or buttermilk have usually been obtained where they are fed fresh, before sufficient change has taken place to decrease palatability an ddigestibility.

Saving Labor in Hog Feeding

Practice indicates that two feedings daily is sufficient for the fattening hog; indeed, that with the exception of the young pig, feeding twice daily is preferable to three. In 1914 at Brandon, this fact was indicated, no appreciable difference in gain being shown to balance the extra labor of feeding. Realizing that the indication of one experiment is not conclusive, it may be said that close observation at Ottawa and findings of other institutions point to the same result. Many hog men feed breeding stock, and even growing hogs on good pasture but once daily. After such a statement, there is an apparent inconsistency in the fact that results equal to those of expert hand feeding may be obtained where the food is placed within reach of the hog at all times. Yet such is the case. Experiments at Ottawa, Brandon and Lacombe all point to the feasibility of the self-feeding method, and to the fact that it gives results equal to hand feeding with a reduction of from 6$% to 80% of the labor of feeding.

Self-feeding Animals

At Ottawa, the use of the slef-feeder vs. trough feeding for three years would indicate (1) self-fed hogs require .1 pound more meal per pound gain than to the trough fed (average of two years); (2) that entirely aside from the saving of labor, hand feeding gave rather cheaper costs (.29 cents) per pound gain; accounting ofr labor saved, this slight gain would be reversed; (3) that invariably hogs may be finished in shorter time where self-fed; (4) that waste is almost entirely eliiminiated (provided the feeder is of correct design); (5) that digestive disturbances sometimes caused by over-feeding by hand are rarely, if ever seen; (6) that while it is quite possible to wean little pigs direct to the feeder, they make more economical gains where hand fed until three months of age.

At the Experimental Farm at Brandon, Man., self-feeders gave excellent satisfaction in pasture experiments conducted in 1916, and their use was recommended by the superintendent. No comparative results were available.

The Self-feeder on Pasture

At the Experimental Station at Lacombe, Alta., where swine feeding is a major feature, self-feeders were tested in 1916. This experiment, conducted on pasture, idicated a greater grain cost per pound gai nfor the self-fed hogs of .84 pounds, and a lesser time cost of 51 days in a feeding period of 92 days. While, as at Ottawa, hand-feeding here gave slightly lower grain costs on a short feeding test, later indications were that self-fed hogs, fed to a finish, showed greater economy of gain than those fed by the common method.

During the past season the self-feeder-pasture system is shown as being the most economical. Rape pasture saved 2.453 pounds of grain per acre, as compared with the grain cost of producing the same amount of pork without pasture, both groups being self-fed. Rape pasture, with meal self-fed, carried hogs at the rate of 9,254 pounds per acre for a period of one hundred and forty-six days. For the pasture season, with grain self-fed, indications are that an acre of land will carry on an average of four thousand pounds live weight hogs. As for the self-feeder, this device would appear to increase the capacity or power of one man, one hundred per cent. at least as compared with hand feeding.

As to economy of grain, these later experiments showed for the self-fed group 4.34 pounds of grain per pound gain, as against 4.72 pounds for the hand-fed lot, both on rape pasture With self-feeder, the grain cost per pound gain is usually higher than where hand-fed. At Ottawa, in 1917, the following results were obtained on dry lot feeding:—

	Meal, milk (trough-fed)	Meal, milk (self-fed)	Meal tankage (self-fed
Average weight per pig at start	16.9 lb.	20.8 lb.	26 lb.
Number of days in experiment	88 days	66 days	66 days
Average weight per pig at finish	92.1 lb.	90 lb.	60.9 lb.
Average daily gain	8.5 lb.	1.05 lb.	.53 lb.
Meal eaten per pound gain	1.51 lb.	1.79 lb.	3.9 lb.
Skim-milk per pound gain	5.2 lb.	4.1 lb.	———
Cost per pound gain	4.8 lb.	5.3c.	10.1c.
Cost per pound gain	4.8 lb.	5.3c.	10.1c.

The rapidity of gain of the self-fe group, the value of skim-milk as a meal substitute, and the high cost of production of the tankage fed group, are points worthy of note.

Facts and Deductions for the Coming Season

1. Wheat by-products, barley corn, and certain of the concentrates already mentonied, may be procurable during the coming season. There is no guarantee of supply.

2. Barley is practically the equal of corn. By growing barley this summer, the hog feeder may be more in dependent of the feed market.

3. All possible conservation of meal is desirable. Milk products, unless their use is possible for direct human consumption, form the greatest of pork producers and grain substitutes.

4. Garbage, where the collection of such may be arranged and regulations complied with, is almost a complete food in itself, or at least, possible of substituting a large part of the grain ration.

5. Middlings, the food of the little pig, and no longer obtainable, may be replaced by 70% shorts, 20% corn meal, and 10% oil meal. With this milk in some form is the one best food. Too much substitution with the young pig is likely to result in disaster.

6. Increased hog raising with decreased labor, is made possible by the self-feeder.

7. Pastures, as mentioned, form meal substitutes that cannot be neglected this year by the grower of swine who looks for a fai rprofit.

8. A combination of pasture or successive pastures with milk by-product and grain self-fed, is especially recommended as an ideal system. Tankage and a self-watering device are mentioned where milk is not obtainable. Cheap, home-produced feeds are thus largely supplied. The hog supplies a great part, but not all, of the labor.

THE PEA WEEVIL.

The Pea Weevil, Bruchus pisorum L., has during recent years increased to an important extent in the province of Ontario, and it is, also, now present in a few localities in the province of British Columbia. In years gone by annual losses in the province of Ontario alone due to the ravages of this insect reached a total of at least $1,000,000.

Description and Life-History

The adult insect is about one-fifth of an inch long and about one-tenth of an inch wide. In colour it is black, overlaid with patches of brownish and whitish hais, the latter giving the appearance of conspicuous spots. The ground color at the end of the body beyond the wings, appears as two black spots in a patch of whitish hairs.

The female beetles lay yellowish eggs, singly, on the outside of the forming pods. Several eggs may be laid on a single pod, in fact, it is recorded that as many as twenty eggs have been found on the pod. On hatching, in a few days, the young grub eats its way into the inside of the pod and attacks a seed. After entering the seed the insect remains therein throughout its larval and pupal states, in fact, as a generar rule, the mature beetle, also, remains in the seed until the following year. Some of the beetles, however, particularly in years of abundance, are known to leave the peas in late summer or autumn and hibernate beneath rubbish or about barns and other outbiuldings. The beetles which are planted with the seed emerge through the soil and with those that have survived hibernation beneath rubbish, etc., fly to the vines, when the pods are forming, for the purpose of laying their eggs.

Concerted Action Necessary

Owing to the fact that most of the bettles remain in the seed until the following year, the danger of introducing the insect into uninfested districts by bringing in seed from an outside infested locality is readily apparent. At the present time the infestation in the Okanagan country about Penticton and Summerland, B. C., although important is not one to cause serious alarm or to interfere in any way with the plans of the Experimental Farms Branch of the Dominion Department of Agriculture, in co-operation with the British Columbia College of Agriculture, to make the province of British Columbia an important pea seed producing centre. It is, however, of the utmost importance that farmers and others who, in 1918, will be growing peas, should keep a close watch over their crops for the appearanace of the insect in any of its stages. In the districts in British Columbia referred to, into which the Pea Weevil has recently been introduced, advice has been given by officers of the Entomological Branch, as to the non-sowing of infested seed unless the same had been fumigated, as hereinafter mentioned, to destroy weevils.

Crops of peas known to be infested in 1918 should be harvested as early as possible and the seed fumigated with bisulphide of carbon. Peas grown in community gardens or other small areas which are found to be infested should be destroyed at once, either by burning or immersion into boiling water. Such concerted action by gardeners generally and the early harvesting and fumigation of infested seed grown by farmers under acre conditions throughout the districts where the Pea Weevil is now known to occur would undoubtedly soon control the pest. It would indeed be disastrous if this destructive insect were allowed to become firmly established in districts in which pea growing is now being developed, through indifference or carlessness on the part of any grower in not co-operating in the endeavor to conrtol the weevil.

Treatment of Infected Seed

Fumigation.—The fumigation of infested seed with bisulphide of carbon is an excellent remedy. A convenient method for treating small quantities of seed is to fill an ordinary coal oil barrel, which will hold about five bushels, the quantity of bisulphide to use being one ounce to every hundred pounds of seed. The bisulphide may be poured right on the seed or placed in a shallow receptacle but care must be taken to close up the top of the barrel tightly. This is best effected with a cap made specially for the purpose, but may also be done with fine sacks laid smoothly on the top, over which boards are placed with a considerable weight on them to hold the covering down closely. The exposure should be for at least 48 hours.

Larger quantities of seed may be fumigated in tight bins, "bug houses" or other well-constructed chambers using one pound by weight of bisulphide of carborn to every one hundred bushels of seed, the exposure as above mentioned to be 48 hours. The bisulphide sould be of good quality and such as will vaporize without any residue. It may be placed in shallow dishes at the top of the bin or chamber. Bins may be made tighter by pasting paper over either the inside or the outside. Strips of felt should be fastened along the top edges where the lid fits down. The fumigation as above mentioned sould take place as soon as possible after the harvest.

The vapor if bisulphide of carbon is of course, highly inflammable and lights of all kinds must be kept away.

Holding over seed.—The Pea Weevil will not breed in dry seeds, so if seed is held over in tight bags for one year any beetles present will emerge and die. Small growers have found this an effective method of protection.

Coal oil treatment.—Coal oil has been found useful in destroying the weevils in the seeds. About half a galon of coal oil is sufficient to treat about a barrel or five bushels of peas. The idea is to thoroughly drench every seed so that the oil will penetrate and kiil the weevil. For this purpose the seed may be placed on a floor, the oil applied, and the peas shovelled over thoroughly. The shovelling should be repeated every day for at least four days, the first shovelling to b edone about two weeks before sowing.

Scalding Seed.—If when sowing, the seeds are found to contain weevils, the latter may be destroyed by immersing them in scalding water for about one minute, cooling the seeds afterwards by pouring cold water over them.

RING WORM

1. Please give me some information on ring worm. What causes the trouble? Is it infectious? What treatment?

2. What is the cause of big patches of hair comlng off the skin of cattle,

G. M.

1. Ringworm is caused by a vegetable parasite which also lives on damp walls, woidwork, etc. The dis ease is contagious. After perfectly removing crusts or scabs, paint spots twice daily with tincture of iodine. It may be necessary to saturate the parts with oil for a few days to get rid of the scabs.

2. Ringworm is present if the spots are covered with thick crusts, otherwise the trouble is alopecia arriatt, the cause of which ois not perfectly understood, nor is there a specific remedy. Oil of cajuput rubbed in two or three times a week may help.

It was estimated in 1907, after a full enquiry, that the annual average loss caused in Great Britain by each rat was $1.80, in France $1.00, and in Denmark $1.20.

Conservation—use without abuse.

HORTICULTURE

MULCHING THE ORCHARD

It is possible to use grasses and clover continuously in orchards as cover tops, by stimulating their growth by means of chemical fertilizers, with advantage to the trees on poor soils. On fertile soils the advantage is less apparent, but even in this case the growth of material for mulching is good economy, because the result is fully equal to that of the best methods of culture and the growing of cover crops. The possibilities of grass culture in orchards, combined with mulching, have been greatly increased and the necessity of orchard cultivation has been much lessened. There is now opened to orchardists a freer choice as to methods to be used in both the rejuvenation and the maintenance of apple orchards.

The importance of this will be seen when it is remembered that the fruit on apple trees in grass, and well mulched, is more highly colored than that produced by trees under cultivation. This fact points out one way to meet competition in the markets. Orchard mulching has decided advantages in certain particulars, but the growing of mulching material in the orchard with the aid of fertilizers is a more distinct and decided step in advance because of its greater practicability and wider application as well as tis bearing upon marketing problems.

The objection usually urged against the plan of growing mulch material in the orchard is that such a practice draws largely on the moisture content of the soil, and that the trees and fruit will suffer in consequence. So far in our work there has been no evidence in support of such a theory; for vigor and growth of trees have been all, and even more at times than are desirable, while the fruit has attained good size, perfect form, and, except where entirely hidden from the sun by the heavy foliage, of good color. The growth of grass takes place early in the season while there is an abundance of moisture in the soil, and is cut in June, after which the accumulation of decayed and decaying vegetable matter on the surface conserves the moisture and keeps the soil cool by shading it heavily from the direct rays of the sun.

Mixed Weeds to Fine Grasses

One of the most striking results of the repeated use of chemical fertilizers on the over-cropped, eroded, thin soils of the hilly sections is that the sparse, almost worthless, soil-covering of weeds and poverty grass, which almost invariably occupies abandoned orchard areas, is soon replaced by a dense growth of the better and finer grasses which thrive and increase as the seasons pass; and which annually clipped and permitted to lie on the ground, blanket the almost naked hillslopes with a covering of decayed vegetable matter. No grass seeds have been sown in bringing about this surprising change.

The secret for the amazing transformation is that, scattered among the weeds and poverty grass which nature provides to spring up and occupy land too deficient in plant food to enable the better grasses to thrive, one may find here and there, by close inspection, weak, struggling plants of timothy, redtop, blue grass and white and red clover. These plants are so small, delicate and few in number, in many cases, that a casual observer would scarcely notice them at all. Yet they are ready, when the particular elements of plant food upon which they thrive are supplied to them in generous measure, to spring promptly and vigorously into growth, and to multiply and thicken and take possession of the ground upon which they previously had been able to maintain but a feeble existence.

Under this treatment of orchard soils it is pleasing to note the ready and geenrous response of the trees in increased growth, vigor and abundant fruitfulness—a response which enables orchards occupying steep, rough, difficultly tillable land to compete successfully with orchards under annual cultivation with cover crops where tillage may be practiced with ease and satisfaction.

Nitrogen and Phosphorous Important

The application of plant food, rich in quickly available nitrogen, causes such plants as timothy, blue grass, redtop, and, in some cases, orchard grass, to spring up and take possession of the ground where before only weeds and poverty grass conspicuously existed, so that the comparatively worthless weed growth will be crowded out. However, where this marvelous development of the better grasses is promoted by the use of plant food rich in nitrogen, the occasional, barely existing, small and weak plants of red and white clover are not noticeably benefited. Indeed, in the experiments which we have had under observation, the vigorous, dense growth of the grasses which delight in an abundant supply of nitrogen has practically crowded and smothered the little clover plants out of existence.

On the other hand, where phosphorus in the form of acid phosphate is used alone or in combination with muriate of potash. there is but slight beneficial ffeect on the grasses; but the small, scattering clover plants soon begin to increase noticeably in size, spread or multiply, and gradually take possession of the soil.

The annual application of 350 pounds of acid phosphate has been the means of sccuring the prolific clover development on the plots treated with this chemical, either alone or combined with potash; yet when a weight of nitrate of soda equal to that of the acid phosphate was added, it complete-

What CP Means to the Man who is Hesitating.

Have you been trying to decide whether or not to Paint, this spring?

You know the House needs Painting; yet perhaps you feel that you ought to save the money.

Frankly, you won't be saving anything—but you will risk losing a big part of what you have invested in the house.

C. P. Paint Protection is true conservation—because it guards your buildings against the destructive effects of climate and weather.

The money laid out for CANADA PAINT conserves the much larger amount already put into a house, barn, garage or other property.

GROW STRAWBERRIES

In the rush of other work, do not forget to set that new bed of strawberries this spring. Many growers are cutting down their acreage on account of labor difficulties and the high price of other crops. Production for the next few years will be cut in two and berry prices are sure to be high. Our advice to our fellow Fruit Growers is, grow all the grain you can, but DON'T GIVE UP THE STRAWBERRY. Among other varieties we recommend Senator Dunlap and Warfield at $4.00; Sample, Arnout, Buster and Glen Mary at $5.00; Wm. Belt, Dr. Burrell, and Bubach at $6.00 a thousand. The great everbearer, Progressive at $1.25 a hundred. Send a card for our free Catalogue.

CYRUS & MANNING ELLS, Port Williams, N. S.

ly overbalanced, by the production of grasses, the effect of acid phosphate which nourishes and encourages the clover.

THE DIETIC VALUE OF FRUIT

(By Mrs. Alex. Cuppage)

The fruit eating person is generally a good natured person. Not only does t he eating of fruit tend to perfect digestion, but it stimulatets the production of high-class fruits in all parts of the country. It was only a few years ago that a banana was a stranger to most of our people, while now it is regarded as almost a necessity. The Woman's Institutes of Ontario, of which the writer of this article is a valued member, will do well to call the attention of hotels, public institutions, as well as private households, to the importance of fruit dishes in the daily menu, as well as to the better preparation of these.—Editor.

Fruits in some form should constitute an essential part of our every day diet, for the following reasons:

(1) Because they taste good and we like them. I place this reason that can be given.

Everyone in a normal condition enjoys fruit, and the natural appetite is a true guide to the needs of the body. Hunger and thirst are sensations wisely given, and when not abused direct us in the path of health. That is to say, happy living for good health is not only wealth, but happiness also. If one has a good constitution, and is temperate in his or her habits and leads a clean, pure and wholesome life, his or her appetite is a good guide that may be implicitly trusted. Under such conditions we all like fruit, and should eat it in the serene confidence that the thing you like in the way of food, is the thing you need most.

In satisfying our natural appetite for fruit we use such fruits as are well matured, juicy, and fine flavored, we reach the hghest form of palate, or taste a real pleasure with the best possible digestive effort.

(2) Because they help to keep our bodies in a good condition. Our ordinary fruits contain the following substances or compounds in greater or less proportions:—water, sugar, acids, oils an ethers, proticol, pectose, cellulosc, or vegetable fibre, and ash or mineral salts. These substances are all essential constituents of a perfect and well rounded diet for our bodies.

While the actual nutrient value of fruit is not high, its dietic value is very great.

The two qualities which most serve to render fruit wholesome are their acid juciness and flavor. The juice is largely water but it contains the sugar and acid of the fruit, and if these are present in large quantities and in the right proportions, the fruit juice is agreeable and refreshing. Flavor also adds to the quality of the fruit. The flavor of fruit is due in part to the acids and sugar they contain, but more largely to the volatile acids and ethers.

Fruit acids and others, when taken into the body have a tendency to lower the temperature of the blood, and thus correct or allay any slight feverishness that may exist.

They also tend to keep the organs of secretion like the liver and kidneys, normally active.

The pectose and cellulose of fruit correct a tendency to constipation and signally aid in keeping the whole digestive tract in an open and healthy condition.

Again, if children were given free access to fruits, I think there would be less indigestion or bowel troubles. For after a child is two and a half years old stewed fruits should be freely used especially apples, prunes, figs and peaches. For many children all ripe fruits are a laxative; and for this reason alone, if for no other, they are valuable aids in regulating a diet that is frequently much too starchy, keeping a child dull, sluggish and very unhappy.

The sub-acids of fruit are highly antiseptic to our bodies, and tend to prevent disease germs from finding a lodgment, and developing in our systems. As to what kinds of fruit, or how much to eat, there is only this answer. Eat the kind of fruits you like, and can best afford, and eat just as much as your conscience and good judgment will allow you.

When to eat fruit is a less personal question, and the following general advice may be of service.

The fruit should be eaten when you eat other food. Although fruit is easily digested, it is not wise

to be constantly and frequently putting into our stomach food of any sort. By this practice the strongest stomach may be ruined and refuse to take the best food.

b. When fruit is eaten before breakfast, say an apple or an orange, its cooling and laxative effect is likely to be at its maximum.

c. Fruit is an excellent thing to be taken with the mid-day lunch. One or two slices of bread taken with an apple, is better than three with out an apple.

d. Fruit of any sort eaten after dinner adds largely to the pleasure of the palate, while adding little to the tax upon the digestive organs which are more likely to be overtaxed when there is no fruit in view.

e. If it is ever desirable to partake of a late supper, it is well to remember that an apple, a pear, a peach, or an orange, some plums or a bunch of grapes, will be less likely to haunt our late slumbers than oysters, meat salad, ice cream, potato salad, rich cake, pies, and other sweetmeats.

Mahone Bay, N. S., 1918.

Mr. R. U. A. Landsman,
Prosper Hill.

Dear sir:—

Answering your valued inquiry for information re potato spraying outfit, beg to say that the pump is all brass, for the reason that the liquid will rust the inside of anay pump having an iron air chamber or iron pipes touching the spray. This rust, breaking loose, pumps into nozzle and clogs them. The piston of the pump is packed with a special fibre packing, made in such a way that it can be kept tight for years and new packings cost but little. The relief valve at the base of the air charmber permits pumping the liquid back into the cask, thus with the agitator and the returned liquid the mixture is quickly brought to a uniform strength. This valve will also drain the pump when you are through spraying.

The four row potato spraying attachment has a strongly built iron frame. The mixture is conducted to the nozzles through hose and brass pipes. The spray boom can be folded for passing through a gateway, or packing away when not in use. The nozzles can be adjusted for width of row and instantly for height and angle of spray. Four nozzles follow the tops of the rows and six intermediate nozzles spray the sides of the vines. The stop cock is just at the hand of the opeartor so that the spray can be shut off instantly. This apparatus can be attached to any cart or wagon, and one man can operate the sprayer as well as drive. This attachment can be used with any pump of sufficient capcity. These outfits have been known to run for several seasons without the nozzle once clogging. The straining hopper with brass wire cloth tacked in on an angle cleans the liquid when it is upt into the cask. The buttons permit of the quick removal of the pump from the cask.

The tree spraying attachment of hose, bamboo rod, double nozzle, etc., makes this sprayer into an orchard outfit. With these fine features and many others you see they are well named the "Perfect" spray pumps.

Trusting to be favored with your valued order,

Yours very truly,
R. B. WESTHAVER.

For the potato crop use, if possible, a clover sod that has been manured (if necessary) the previous season; manure applied the year of planting favors the development of scab.

FRUIT PACKAGES

The fruit season is again drawing near, how about your boxes and crates for the coming season To pack and ship to the best markets, you require the best standard packages, which can be had by placing yopr orders early with the

Hantsport Fruit Basket Co'y.

HANTSPORT, N. S.

Speedy Haying and Finest Hay

GOOD hay is made in fast time with little help, year after year, on farms equipped with **McCormick** mowers, rakes, and tedders, and **International** side delivery rakes, loaders, etc.

McCormick Mowers, Dump Rakes, and **Tedders** have been too long and favorably known wherever hay is grown, to need description.

Every hay grower should become familiar with the construction of the new **International Combined Side Delivery Rake** and **Tedder.** This popular, economical machine has two duties in one—it can be instantly adjusted for rake or for tedder. It rakes clean, teds thoroughly, and handles hay gently. It is a left-hand-delivery rake, which means it can follow the mower closely and strike the heads first (not the stems). It does clean work, piling two swaths at once on the clean stubble (not on an unraked swath), for proper curing.

International Windrow Loaders are built to last. Pulled easily by two horses, they load uniformly, leave the field clean, lift hay over 10 feet, do not thresh off blossoms and leaves.

Hay values are high. **McCormick** and **International** hay tools, which put hay under cover in prime condition four or five hours after cutting, return their price, and more, to your pocket. Act early this year! The demand for machines exceeds the supply! Write the nearest branch.

DAIRYIN.G

COW FRESHENING IN FALL WILL PRODUCE MORE MILK SAYS WELL KNOWN DAIRYMAN

To the experienced dairyman, the work of late winter is the most dreaded of all the year. Then it is that the breeding season comes on. especially if a late fall or early winter calf crop is expected. Likewise. the subject of pastures is one that forces itself to the front as the cattle have been kept up all winter and are anxious to plant their feet on terra firma once again. This year the increasing costs of grain rations for the cows make it necessary for the dairyman to go carefully over his inventory of ideas to discover if there is any feasible way to diminish the quantity of grains that seem to be so necessary to the maintenance of a creditable milk flow. Moreover, he who sees a few inches further than the end of his nose will be thinking about the mldsummer season of short pasture and will be planning on crops which may be put in to supplement these pastures and the idle animals over until fall pastrue comes on in abundance.

Fall or Spring Calves

The spring calf is the one most commonly met. Despite this fact, his brother born in the fall has the better of him in many different respects. While it is well nigh impossible to have all the cows freshen in the fall, it is certainly desirable from many viewpoints. It has been proven long since that the cow freshening in the fall will produce from one-fourth to one-fifth more milk than the same cow freshening in the spring. And why shouldn't she? While the calf is still young the mother secretes the milk copiously. and this, taken together with the silage keep up the flow all winter. Spring. with the attedant green grass further stimulates the dairy matron. Thus there is constant and continuous urge until the period of short pastures. Then while the owner is busy making hay, plowing corn and harvesting grain, the cow kindly desists from milk giving and allows her owner to enjoy the balmy breezes of a midsummer evening in preference to sweltering in the torrid heat radiating from a cow with a full stomach, a distended udder and a turbulent, fly-tossed tail.

Moreover, the cows that freshen in the spring add insult to injury by giving milk most copiously just at a time when the pricie of milk. butter and their derivatives are lowest in price. The fact that the cows gave most thorugh fall freshening and that this product is worth much more during the winter are reasons sufficient to make any selfrespecting dairyman change the old order of things.

But that is not all. I find that fall calves can be raised much more easily than spring calves. The calf pails are easily kept sweet. there is more time to fuss with the young bovines and so. all the way around, the youngsters soon get to eating hay and grain—they grow and thrive and spring finds them ready to go on pasture without fear of scours. Lice are to be feared, especially is the calves are kept in a dark place. Not that the dark place brings the lice into being but in such an environment they develop more rapidly and are harder to get rid of. I have used several of the advertised loues powders and any of them do the business.

The late winter is the time to plan on setting all the cows back so that in two years, all of them will calve in the fall. While the usual thing is for the cow to reproduce every twelve months, my observation is that absolutely no harm results from the reproductive process being repeated every ten months for two years if the cows are well fed. When I say well fed. I don't mean running about the straw stack. I refer to a bushel basket full of silage morning and night. a liberal hay feed at noon and a six to eight pound daily grain supplement. Under this feeding. cows show no ill effects of more frequent reproduction. While not advocating this as a general practice, to have the animals bearing their young in the fall will greatly overbalance any loss of milk the owner might suffer through this practice carried on for two years.

Let Pasture Get Good Start

After the long, cold winter with its many attendant dark days in many stables, the cattle will be anxious to get their feet on the ground. Ordinary springs, the temptation is keen to let the cows onto the pasture as soon as they look green; this spring the temptation will be much keener. The man who. in a fit of economy. opens the gate to the pasture before it is able to carry the load is lost. He will immediately curtail his milk production. the pasture will be irreparably damaged with nothnig of value to show for it. Grass may be green without being nourishing; also cattle may eat it with avidity even though it lacks body.

As a long established fact, the early grass is neither nourishing nor satisfying. While it will stimulate a greater flow of milk for a few days, the stimulation is of a temporary nature and is not founded upon any added nourishment which the cows get by virtue of the green, washy grass they consume. Then one should not lose sight of the fact that the grass blades are the lungs and stomach of the plant. In other words, unless the leaves get an opportunity for expansion and development. they fail in their function of combining the carbon dioxide of the atmosphere with the water of the plant to form the carbohydrates which are so valuable in feeding. If there was no other suitable reason, this one would be sufficient since the leaves are like the start which a man makes on a savings acocunt. Destroy the start at starting and the acocunt is worthless—let the start run awihle and the acocunt be comes a source of satisfaction and a fund forever. In the same way the leaves must be allowed to get some plant plant food manufactured before the supply can be legitimately drawn upon.

Many pastures are ruined each year through being perforated by the stock in the early spring. In such cases. the plant roots are crushed and they cease to function normally until well along in the season. A herd of cattle in a wet pasture for a single day can ruin the prospects for two weeks' feeding a little later on.

Late Summer Soiling Crops

Abundant feed for a while and then a scarcity of feed will not suffice to keep a dairy cow at her maximum production. If at all posible, the suply of pasture should be at all times kept ample for the animals that must go to grass each day. And so it becomes the part of good dairy, long distance wisdom to plan now on that portion of the late summer which is ordinarily one of extermely short pastures and what there are is of extremely poor quality. Commonly, the last two weeks in July and the first two in August see a dearth of good pastures. It is necessary to grow something to bridg eover the gap between the abundant pastures of early summer and those of early autumn.

While not generally in favor of soiling crops for the dairy cows, nevertheless a soiling crop it must be since there is no feasible combination which will insure pasture at this time under the conditoins which usually rule. True. some years oats. planted about the first of June make good supplementary pasture. but two weeks of dry weather in June puts all this at naught. More dependable thana this combination, however, is one of oats and cow peas planted together about June 1. I have seen this combination in use several times and ordinarily it fills the bill.

Wilted alfalfa hay is an A No. 1 supplenmentary soiling crop and it is found on too few farms today.

I. J. MATTHEWS.

NO CLEAN MILK CAN COME FROM AN UNCLEAN PAIL

Often the separator and strainer are painstakingly washed and scalded while the milk pails are washed with a cloth and rinsed in water in which the separator is sterilized. Indeed the housewife would be indignant should some one intimate her milk pails are unclean. It is a fact nevertheless that pails thus washed are simply dirty and the dirt is visible to the naked eye in the seams of such pails.

Unless close atention is paid at

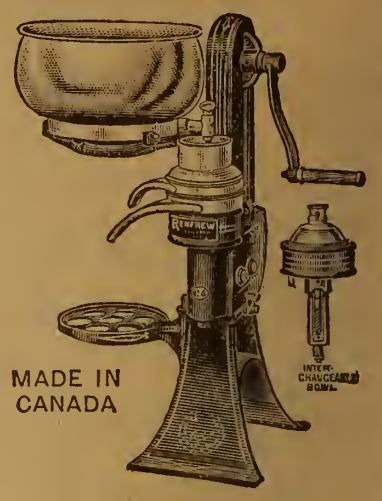
Butter Prices Will Be Maintained

THE Food Controller for Canada states: "I do not expect that the sale of oleomargarine will result in any reduction in the price of butter. The overseas demand is practically unlimited --- For years after the war Europe will require all the butter which Canada can produce for export, and the prices are certain to be high."

High prices for butter make every pound of butter-fat saved a source of extra profit that is a revelation to many farmers and dairymen. The

Renfrew

saves you about one half-pound of valuable butter-fat, per cow, per week, over other machines, even if they are in running condition, and much more if they are not running properly. Multiply this half pound by the number of cows in *your* herd and then calculate what this means to *you* in dollars and cents per year. Will it pay you to continue losing money by using an ordinary machine? The Renfrew gets all but the last three ounces of butter-fat in a ton of milk skimmed.



MADE IN CANADA

Which would you rather sell at present prices?
10 Gallons of good firm butter-fat from the Renfrew which gets all but 1-10 pound in every 1,000 lbs. skimmed.
or
7 Gallons butter fat from other machines which lose a whole pound in 1,000 lbs. of milk skimmed.

Besides quantity, the Renfrew gets *quality*, Good first-class cream means globulcs of fat unbroken, and bettcr, firmer butter. This high quality of cream is secured by the exclusivc curved wing centre-piece of the Renfrew, which distributes the milk to the discs in thin sheets, and prevents the slapping of milk and breaking up of the fat globules, which occurs with the ordinary straight wing machines.

Our illustrated booklet gives Government Dairy Schools proofs of the close skimming. Also read about thc Renfrew's exclusive interchangeable-capacity feature, self-oiling system and many other modern advantages. Write for booklet today.

NOTICE.—The Renfrew Separator illustrated here was formerly sold under the name "Standard," which identified it as a high efficiency cream separator. The name "Renfrew" has been used on the same machine for several years for our United States and foreign trade and under that name has become as popular in those markets as under the name "Standard" in Canada. Now the name "Renfrew" has been adopted for Canada so as to link the name more closely with that of our company and so that we can sell the machine under a uniform name throughout the world.

time of washing the soured milk that remains in the seams and other lodging places bout the pails is not noticed. Close inspection will often reveal insanitary milk pails. Cleanliness is the one thing that makes quality in the dairy product in any form, whole milk, cream or butter.

An unclean milk pail will have a deteriorating effect upon quality more than any utensil. for the time the milk remains in the pails its temperature is such that it readily absorbs filth and odors—it is really a nideal seed bed for germs.

Much time and labor can be saved in washing if care is exercised in purchasing pails with smooth surfaces with no unnecessary crevices to harbor milk or any foreign substances We usually wash four milk pails. On three o fthem we have to use a darning needle. nut pick or some such tool to remove the milk from the rim at the top, on the outside, while the other one is soldered down so smooth that it needs na extra attention.

Another thing, there is quite a difference in time required to wash the ears that fasten the handles on milk pails. A milk pail can not be thoroughly washed with a cloth; never touch the milk pail with the dish rag but have a special dairy cloth. The best material for this purpose is a large square of mosquito netting as it is so easily kept clean. A vegetable is so easily kept clean. A vegetable brush is excellent for washing milk pails and if a nut pick is used in the crevices there will be no dried or sour milk left to contaminate the new milk.

Not only is the quality of the dairy product increaed by thorough washing but the life of th epails is prolonged. Usually the pails commence to rust in the seams and bottom because they they are not thoroughly dried. There will soon be a leak in the rust spots, when there is no reason why they should wear out or break sooner than other parts of the pails.

To keep the pails in the best possible condition, wash imediately after milking before the milk dries. First First rinse with cold or luke warm water ,then wash in hot water, using some cleaning agent and plenty of "elbow grease." The creamery company to whom we sell urges its patrons to use no soap on dairy utensils. Rinse with boiling water and then invert each pail over a kettle of boiling water for a few minutes. The steam sterilizes the pail and the heat dries the surface without further attention. There will be no rusty pails from dampness when this process is practiced. If your milk pail is not thoroughly washed it may contaminate the milk more than all the dirt that falls into an open pail.

FAMILY RECORDS IN THE SALE RING

The dairy business has become a much more complicated financial proposition than it was in its earlier state, and there is now much more oportunity for financial loss than when the labor of the farmer was the only item at stake. The business has grown up gradually to this condition, and many farmers have not changed their methods to meet it. They may have increased the number of cows on their farms, and purchased larger amounts of grain to feed them, but the question of profitable dairying is not solved by the number of cows kept. It must come through the larger production of the individual cow. Every dairy has some good cows, so to improve the herd the owner must eliminate the cow that has not the ability to produce enougt to pay for her keep and breed from the good ones, using a full blooded sire from a good producing family to head the herd. Look back and see the family record of the sire, whether he is from a roducing family or not.

DEVELOPMENT OF PURE BREEDING

The purpose of pure breeding is the improvement of grade herds, says Dr. Hubert Work. All cattle are scrubs unless they have a pure bred sire or dam; then they become grades, and it necessarily follows that the greater number of pure bred crosses the higher the grade.

It is posible through the use of pure bred sires to practically breed out the 50 per cent. of blood imported to the offspring of the first cross, but it will never be possible to register as pure bred such a descendant no matter how far removed, because it is not possible to fix a starting point.

For practical dairy purposes a cow with three, four or more pure bred crosses is nearly as productive as a pure bred, providing the very best sires have been used, and can be procured at much less cost, but the strain of scrub blood remaining is always an element of uncertainty in determining the value of progeny.

The more uncertain the breeding of a dairy herd, the more important it is to cross with a pure sire of outstanding merit.

No dairy man who saves his heifer calves can afford to use other than a pure bred sire, otherwise his cows will always be scrubs and their production limited. The butterfat content of milk must be bred into cattle, it cannot be fed into them.

WORTH CONSIDERATION

Perhaps some of your cows gave twenty-five pounds of milk yesterday, and some gave twenty-two; the difference of three pounds in the day, a pound and a half in the milking might easily be overlooked. In fact the smaller quantity might appear the larger on account of more foam on top, and might easily pass as the larger mess if not weighted.

But a pound and a half aa a milking may amount in a lactation period to a thousand pounds and that is worth consideration.

In the plan of the cow testing advocated by the Dairy Division, Ottawa, no man could be a thousand pounds astray in his judgment between two cows, for he would have the weight given by each cow jotted down at the time. Some men weigh three days per month, many prefer to weight daily, it is better; the two different printed forms are available for free distribution, write today and get them, stating which you prefer, the daily or three day form.

A thousand pounds of milk, worth say twenty dollars may affect your decision in selling or keeping a cow. The good herd that you have in your mind's eye can be built up by giving each producer due credit. Don't sell a good cow not knowing her real value and so sacrifice twenty dollars worth of milk for the sake of a one dollar scale.

Eight Good Reasons Why You Should Buy a

DE LAVAL
CREAM SEPARATOR

GREATER CAPACITY: New capacities have been increased 10%, without increase of speed or effort required in operation.

SKIMS CLOSER: The improved bowl design, together with the patented milk distributor, gives greater skimming efficiency.

EASIER TO WASH: Simpler bowl construction and discs caulked only on the upper side make the bowl easier to wash.

EASIER TO TURN: The low speed of the De Laval bowl, the short crank, its unusually large capacity for the size and weight of the bowl, and its automatic oiling throughout, make it the easiest to turn and least tiring to the operator.

THE MAJORITY CHOICE: More De Lavals are sold every year than all other makes of separators combined. More than 2,325,000 are in daily use—thousands of them for 15 or 20 years.

TIME TESTED: The De Laval was the first cream separator. It has stood the test of time and maintained its original success and leadership for 40 years the world over.

EQUIPPED WITH SPEED INDICATOR: Every New De Laval is equipped with a Bell Speed-Indicator, the "Warning Signal" which insures proper speed, full capacity, thorough separation and uniform cream at all times.

SERVICE WHEN YOU NEED IT: The world-wide De Laval organization, with agents and representatives ready to serve users in almost every locality where cows are milked, insures the buyer of a De Laval quick and efficient service whenever he needs it.

Order your De Laval now and let it begin saving cream for you right away. Remember that a De Laval may be bought for cash or on such liberal terms as to save its own cost. See the local De Laval agent, or, if you don't know him, write to the nearest De Laval office as below.

LIVE STOCK.

HOG FARMING

Frequently we get requests for information about piggeries that will accommodate large numbers of brood sows or feeding swine, and in some instances plans are desired for buildings that will house all kinds from sucking pigs up to breeding fattening aniimals. Swine raising should be a profitable enterprise when carried on in conjunction with dairying or some other line which provides considerable by-products acceptable to pigs, but it should be remembered that housing is an expensive factor and not the only factor which should enter into the calculation.

For a large proposition one should consider available land and pasture. Originally the hog was a foraging animal and when the farmer allots a certain area to a definite number of pigs, and does not think only of pen room, he is more likely to succeed. The housing of large numbers in buildings is inviting trouble, especially with breednig stock. Furthermore, very young pigs do not thrive so well in the enclosure with feeding hogs, and separate accommodation should be provided for both.

It would be very easy to go to excess in constructing expensive piggeries. Of course, feeding pigs would not do well where the temperature goes very low in winter, but in the damp, poorly ventilated house, though warm, is just as bad or worse than a cold, dry house. The dry, well-ventilated building, moderately warm, is ideal for all kinds of swine, and such can often be built at reasonable cost from material at hand, or by putting a cement floor, glass and a ventilating system in some old outbuilding. For summer there is no better method of housing either feeding or breeding stock than in the colony, or portable house. Up to a couple of years ago very comfortable and convenient rectangular houses could be built for twenty dollars, counting labor and material. The price of lumber has advanced and the value of labor has increased somewhat, but on n ordinary farm almost enough material could be picked up around the place to make one or two houses.

In summer swine raisers should make extensive use of pasture, not only on account of the economical gains thus made, but to maintain the health and vigor of the land. Breeding stock, particularly, should have access to the soil, and shoats give considerable response to forage crops when receiving a grain ration in addition. Some pertinent advice is contained in Bulletin 95, of the Missouri Experiment Station. Three general conclusions from this Bulletin bear on this question:

1. "The number of hogs which may be kept on each acre of forage will depend upon the abundance of forage, but in general not more than 10 to 12 head should be used."

2. "The greatest returns have been obtained when grain was fed in addition to the forage at the rate of 2 to 3 per cent. of the weight of the hogs per dey. The amount fed per head per day should be increased as the hog increases in size."

3. A very good plan in feeding 80 to 100-pound hogs on forage would be to feed per head per day, durng May, 1.75 pounds of grain; during June, 2 pounds grain; duriny July, 3 pounds grain; and durinb August, 4 to 5 pounds grain.

The same bulletin says: "The gains made on forage are made at 20 to 30 per cent. loss cost than gains produced with grain and dry-lot feeding." In a trial with alfalfa, with grain fed additionally, it was found that 596.8 pounds of pork could be accredited to each acre.

In a test with red clover, 572.2 pounds of pork were accredited to each acre of forage eaten, and in a field of rape, oats and clover, 394 pounds of pork were accredited to each acre of forage eaten.

At the Ontario Agricultural College it has been pretty well demonstrated by experiment that it is unwise to tur nhogs to pasture until they weigh in the vicinity of 100 pounds. However, brooding sows sould be out when there is grass, and a proper system of supplying forage will induce largely the types of buildings constructed and amount of indoor accommodation provided.

HALF OUR BULLS ARE GRADES

That in 35 dairy districts of Canada with 5,620 bulls in use, 47% of these are grades was the surprising statement of C. F. Whitley in discussing cow testing. He went farther, and said that out of the remaining 53% one-third are poor and undesirable animals.

We are coming to pure breds in horses, but the question in its relation to cattle is ignored.

Breeding, it was also pointed out is not all, however. Mr. Whitley told that at a recent auction sale two herds of equally well bred cows were put up; one lot, with no record, averaged $145.00; the other lot, with records, fetched an average price of $303.00, more than twice as much.

The point is, that by the use of a scale and Babcock tester the true value of a dairy cow can only be learned. "Just recently," he said, "$1,000 was offered for a fine prepotent sire whose worth was undiscovered till he was simmered down for beef extract. One of our recorders kept track of the performance of daughters of two pure bred sires of the same breed in one small district and found a difference of almost $600 in the value of the butter in one year. Let us save those good sires.

"When total income from any herd, or any one cow is only at a medium level, unless expenses are remarkably low, the resulting profit cannot be in keeping with th just deserts of the modern dairyman. If a cow's total product of fat is worth seventy dollars and her feed is valued at sixty-five, does the clear five dollars pay? We naturally say that so and so has a "good" business, or that this is a paying investment as the interest or net profit is high. The large turnover, either with matches, mops, or milk does not necessarily mean a paying business, often the growing expenses quickly devour income leaving a bare skeleton of profit. If you prefer to think in large figures you may recall that the newspapers recently stated the G. T. R. in a certain period had four million dollars more as gross receipts, but the net earnings were three million dollars less.

Are we at present on an economically sound basis when we still harbour the poor cow? It has been stated authoritatively that many industries do not realize twenty per cent. of their possible capacity; can we "speed up" milk production? I firmly believe we can. Canada has a heavy debt: but the wonderful dairy cow selected, can be relied upon to assist in its liquidation.

Note where men are keeping track of weights and tests and you find their cows are head and shoulders above the average yields of the township or county, twenty-five dollars or more per cow. Where records are kept the herd shows improvement, where the farm and the cows have a poor appearance it is probable the owner is not weighing and sampling; but where the scale is used and the record sheet is studied, there you find the milk yield per cow steadily climbing, four thousand pounds one year soon made six thousand, the one hundred and fifty pounds of fat made into two hundred and fifty; elsewhere you note the yield is up to the eight and nine thousand pound level, or may be the figures are in the fourteen and fifteen thousand pound class, (I am quoting actual records) and three and four hundred pounds of fat per cow, with one hundred dollars or more clear profit per cow above feed cost, and a return of two dollars and a quarter for every dollar spent for feed.

REMOVING THE BOAR'S TUSKS

As a measure of reasonable precaution the tusks should be removed from all breeding boars. Most people harbor an impression that this is a very difficult thing to do, whereas the truth is that it is neither difficult nor dangerous.

Take a strong rope, three-quarters of an inch in diameter, and in one end of it make an eye splice for a running noose.

Empire Users Say

What better arguments could be offered than the practical experience of other farmers and dairymen who have had to solve the same problems as those now confronting you?

The labor shortage is increasing and the demands for greater production of farm products are more insistent than ever. Prices are high, and opportunities for increasing your income have never been better than those afforded at the present moment. Cows mean money in dairy products, and are also a source of rapid increase in the productive qualities of your land.

Don't sell your cows because you can't get labor to milk them. Profit by the experience of men who have solved the milking problem. Mr. W. T. Ellis, the well known dairyman of Billing's Bridge, says, about the

EMPIRE MILKING MACHINES

"Owing to scarcity of labour I wasl forced to instal a mechanical milker. I had studied the milkers carefully for about three years and last June I decided on the Empire, and I wish to say to my brother dairymen that the Empire, so far, has done everything that it was represented to do, and I do not know any dairyman who has an Empire and is not satisfied with it. I have never had the slightest trouble with either the milker or the engine. I milk, on an average, about thirty cows the year round, have two double units, and a two and a half (2½) H. P. engine. We have had no udder trouble or sore teats since we have used the milker. It will milk a cow equally well when she is in full flow, or when she is being dried off.

I know of two dairymen who have taken out other milkers and installed an Empire, with good success, and if I was buying to-morrow, I would certainly buy an Empire."

W. A. DRYDEN, Pres., Brooklin, Ont. G. E. DAY, Sec., Guelph, Ont.

Slip the noose over the upper jaw and work it back of the tusks. Snub the rope to a post. The boar after a moment will cease struggling and will merely pull back, thus holding himself. Slip a bar of iron into his mouth, and have the assistant press it firmly against the tusks of the lower jaw while the operator with a cold chisel and hammer removes the tusks. It is surprising what a ight blow is required to remove a tusk in this matter. It will snap off as easily and as smoothly as a piece of glass. A crowbar is useful for this work, as the lower end is usually of square iron. However, a piece of old buggy axle or an old plowshare will do.

I have seen attempts to saw the tusks. This is not only dangerous but is unnecessarily cruel for the hog. A bolt-cutter is sometimes used, but this is a cumbersome method. Never use a wire device to hold a heavy hog, as the jaw will surely be severely lacerated, and often permanent injury will result. The tusks of the upper jaw need no attention, as they are of no use to the animal as a means of injuring other animals. H. T. M.

TURNING THE COWS TO GRASS SHOULD BE DONE GRADUALLY

The early young grass contains a large amount of water and when the cows are turned onto it before they can get a full bite they have to consume a considerable quantity in order that they may receive sufficient food nutrients to sustain the body and accomplish the regular amount of work in the form of producing milk and butter fat.

Not only is too much of the "washy" grass injurious to the animals, but the pastures are kept cropped sort and never supply the amount of feed througt the season that they would have had the grass been given a chance to get a good start before the cows were turned onto it. The effect of young soft grass is not noticed on young stock but is plainly shown by the cow giving milk. At first the milk flow is slightly decreased but as she becomes accustomed to her new ration and the grass becomes more mature a favorable influence is exerted upon both the quantity and quality of the milk.

When the cows have an opportunity of consuming a large quantity of grass with but little exertion they obtain a ration equal in nutritive value to the dry feeds. The fresh grass is also more digestible than dry hay or concentrates. Fresh grass is also -mfwm centrates. Fresh grass contains a higher percentage of protein than older gras. Analysis of red clover cut at certain dates show that the amount of proteini and mineral substance is greatest in the young plant but gradually decreases and carbonhydrates and fibre increase as the plant matures. This points to the fact that feeds to supplement new grass should be of a carbonaceous nature in order to balance the ration. But as the summer advances and pastures become dry, feeds that will bolster up the protein side are necessary.

Grass should be allowed to attain a height of from 4 to 6 iniches before the cows are turned ont oit. Then a sufficient start will have been gained so that throughout the season, unless too many animals are kept on to, an abundance of feed will be furnished. When grass is 6 inches high sufficient nutriment is stored in it so that the cow is enabled during her grazing hours to obtain a volume of feed large enough that it furnishes nutrients out of which the cow can make milk and butter fat in abundance with ease. The change from the comparatively dry feed of winter to the succulent grass is a radical one, and in feeding dairy cows we should never make a radical change suddenly. It is therefore important to gradually accustom the cows to grass.

The early fresh grass acts as a tonic and a stimulat to the cow and by gradually accustoming her to it her body is protected and she will retain throughout the season much of the stamina and energy stored up from expensive winter rations. A good plan is to let the cows go to pasture about two hours the first day, about three hous the second day, four hours the third day and thus changing gradually from winter to summer feeds. In like manner the winter ration is decreased slowly and regularly so that the increase in milk flow which follows will be permanent rather than temporary.

THE LOVELINESS OF THE MUSQUODOBOIT VALLEY

C. G. R. Booklet on the Beautiful District Traversed by Rail and "The Chosen Waters."

The lovely Musquodoboit Valley, whose charm is less familiar to Nova Scotians generally than it deserves to be, is coming into its own, largely by means of the Canadian Government Railways. The first folder to herald the delights in store for summer travellers who take the trip lies on the editorial desk of The Herald. It is a folder upon whose cover of dark green is a dash of vivid warm scarlet—a scarlet map of our sea girt province, instantly arresting. It is, as to its exterior, the sort of folder which you would be sure to pick up wherever you saw it, and enfolded between the scarlet and green is description of all pleasures in store for the traveller to "the Musquodoboits." At last, in spite of its isolation, the fair place of "the chosen waters" as its Indian name signifies, has been found out. Its gem-like beauty spots are disclosed by an appreciative pen to the travelling public—those hundreds who in their summering seek the refreshments of natural God-made beauty and the repose of the gracious haunts which can only be found off the beaten track.

Here what infinite refreshment, what a feast for eyes and spirit and body awaits all comers. To a fortunate few of us it is well known and dearly loved. It is good to know that the C. G. R. has recognized what a wonderful asset it is, and has honored all this unaggressive perfect beauty with its own special folder. There are fine pictures which are to the written descriptions of scenery and air and the life of the valley what italics are or black faced type—but which more effectively emphasize than either. Petpeswisk harbor smiles up at the reader—still, serene, exquisitely contrasting with the strenuousness and noises and complex life of city streets—dusty city streets of concrete glaring whitely under hot midsummer suns. There is Martinique Beach, Fathom Harbor, Seaforth—all suggest holiday times when nature in the valley sings with a voice irresistible and full of the spirit of companionship:

"Let us take leave of haste awhile
And loiter well content."

—Halifax Herald.

BACKYARD BACON

An increase of 25 to 30 per cent. in the number of hogs in 1918 as compared with 1917 may be confidently expected, the Dominion Live Stock Commission reports. This is a splendid response to the general appeal made to farmers to keep and breed extra sows, and to the conference held during 1917 to further increase bacon production.

The farmers of Canada took this first sstep towards increased bacon production in the face of an acute feed situation. Many of them knew that they would not have enough feed to properly fatten all of their extra young pigs. These pigs must be fed and cared for, and many householders in Canada could help by keeping one or two pigs, which could be bought at weaning time, and fed during the summer, mainly on kitchen and garden refuse. In the autumn, the meal ration could be increased for the purpose of properly ftatening the pigs for killing.

There are thousands of people around small towns, villages and settlements, at cross-roads and elsewhere, who could and should help in this matter. Do not allow kitchen refuse or garden weeds and waste to go unused. It is much more sanitary to have a pig, properly kept in a pen, away from the house, than to allow a dof the freedom of the house after he has been "investigating" your neighbors' garbage. Here is an opportunity of service without sacrifice. It is past the time for doing our "bit"—it is now time to do our "best" Get a place ready to keep a pig.—F. C. N.

The quickest way to save money to pay for an engine is to buy an ALPHA now

PERHAPS you have been putting off buying an engine until you could lay by enough money to pay for it.

A much better way to save the money would be to install an ALPHA Gas Engine NOW and put it to work. It would soon save its own cost, as the thousands of Alpha users in Canada will tell you.

You may be able to buy engines that cost a little less than the Alpha, but bear in mind that an engine that costs you less to buy also costs the manufacturer less to build. And that can mean but one thing—inferior quality throughout the engine.

You don't want that kind of an engine. Its life will be short, its fuel and repair bills high, and you will be subject to time and money-wasting delays.

Send for our catalogue, which tells why the farmer who buys an Alpha gets the most for his money.

Alpha Gas Engines are made in 12 sizes, 1½ to 28 H. P., and are furnished in stationary, semi-portable and portable styles, with hopper or tank-cooled cylinder.

THE HORSE

WEEK-END CARE OF THE HORSE THAT WILL INCREASE HIS CAPACITY FOR MORE LABOR

The attention and feed given horses in general on the farm is calculatetd by the average farmer as so much expense, when literally it is money and time well invested. The farmer who looks upon horse feeding as a necessary evil is the one who has not yet got the horse sense regarding efficient and profitable motive farm power. He has visions of a tractor, but it is an even bet that he would prove just as inconsiderate in his economy in its use, and find that it would cost him a great deal more in repairs and up-keep Tractors have to be well kept to get the best results, and so have horses.

Better Feeding More Power

The combined power of farm horses exceeds any power applied to other industries and it is also certain that if the same average treatment was portioned out to the mechanical power as is given, on the average, to the horse, the upkeep of that power would leave little profit to the industries that depend upon it.

Better horses has been the argument of most of the preceding articles but in speeding up greater production during the coming season, the care and feeding of the horse at present arrayed on the farm field, becomes the timely subject. Better horses and more of them, with larger implements would partially fill the gap in the depleted ranks of farm labor, but better attention and more careful feeding will add greatly to the power already on the farm. The war horse at the front is drilled, exercised anad fed with special care to make him fit for his special effort, and the horse on the farm, to do his extra, must also get special treatment. Those who keep their horses in sleek conditoin all the time are the men who know how important it is to keep them so. The feeding of the horse becomes their second nature and if they are asked how it is done, their answer will invariably be, "Oh, more or less according as they worked."

Courting Sickness

This is the first principle in horse care and in the sudden change from comparative idleness to grim hustle there is a very probable element of danger and loss to be avoided.

Don't get away with the idea that a regular full ration can be given with safety to the team on the first day that spring bursts on the land. A sudden change of diet, or increased quantity, courts sickness and incapacity for strenuous labor. Get to the full ration by gradual stages. To bring the power of a horse that has been comparatively idle during the winter to full capacity, is similar to nursing the gradual growth of a plant, from the seeding stage to the hardihood of ripening days. One and a half pounds of oats per 100 lbs. of live weight, and 16 to 20 lbs. of hay per day —which is considered about the average quantities of daily horse feed—is a rule of thumb method that has to be modified at certain periods as well as with certain animals.

Overfeeding on Sunday

One of the scourages that effects horse power on the farm is the "Black Monday" trouble. It is an heirloom of the practice of giving the horse a full ration on Sunday. Between Saturday night and Monday morning the horse is apt to get the least attention when practically it is the time to exercise grater consideration. A Saturday night ration of laxative nature such as a bran mash of boiled barley or oats mixed with bran and a tablespoonful of saltpetre added, is a safe way to end the week's strenuous feeding. In the old country the springtime feed, every night, is oats or barley and sliced turnips boiled together. This looks like trouble, but it is trouble that pays and nedd only be continued while grass is not available. Half the daily quantity of grain on Sunday will be enough, and a proper cleaning should be given them that day with curry comb and brush.

The Natural Process

Grass is the natural feed of the horse and is the one great stimulant to spring work. When they get accustomed to this changed ration they should be let free for two or three hours every evening, when weather and work conditoins admit. A stretch and a roll on the grass is a refresher to the horse that art cannot equal in domestication.

Have some consideration for the quality of pasture given him, as no energy can be generated from a field of weeds. And the same doctrine applies to the hay. Reserve for spring use the best hay in the barn; timothy hay is not a fit feed for a working horse. If it was over-ripe when cut or badly handled in harvesting, such feed is not a fit feed for a horse at any time.

Regularity in Attention

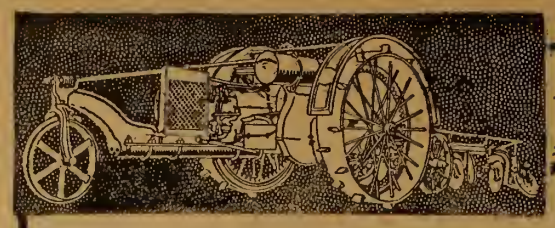
Regularity in feeding, watering and cleaning is another point worth while in fitting horses for their work. Horses are endowed with very retentive memories and can count with an accuracy better than they are credited with. Never disappoint them and you will keep the keen edge on their appetite. Clean out their mangers and feed them from a low one; the flow of saliva will be greater, anad idgestion therefore aided.

Watering, always an imoprtant item in horse care, becomes more important with spring activity. Let them drink liberally before meals, if they are not too warm. But though heated, a thirsty horse should be allowed some water. A draught of 8 to 10 mouthfuls will do him good and stimulate his appetite. After he has cooled let him have his full drink and then his ration of oats. Water should be before the horses at all times and they should get the opportunity to drink more freely before thana after feeding. Care of the feet will add much to the yabor power of the horse. Irrespective of shoeing, much torture and discomfort comes through neglect to cleana out, every evening, the dirt that becomes caked and hard around the frog. Much of the unsoundness found in horses is due to this neglect. A piece of bent wire, or similar ready made picker, is all that is required, and hang it up behindthe horses where it can be handy to get at every time you unhitch or unharness the team.

DEHORN WITH CAUSTIC POTASH

The practice is sometimes followed of cutting out the horns of young calves. This is done by using a sharp knife and simply lifting out the small horns or "buttons" when the calves are a few days old.

It is much more satisfactory to use the caustic potash treatment. If directions are carefully followed in this treatment, the very best of results can be obtained.



Big Results at Low Cost

Turns in its Tracks

THE HAPPY FARMER Model B abundantly makes good this claim because it does everything other tractors do, and does it on cheap coal oil.

It pulls plows, drills or harrows, pulls the binder, draws loads to market, or does road grading; it helps saw wood, fill the silos—does every kind of pulling and belt work on coal oil without carbon trouble or smoke nuisance.

If you want early plowing, seeding and harvesting in critical times, make sure of them by using the

Happy Farmer Tractor

Model A—8-16 horse power
Model B—12-24 horse power

Model B's motor is not merely adapted, it is designed specially for kerosene: it is the most perfect kerosene burning motor made.

The Happy Farmer makes good on the heaviest plowing, yet it is light enough for use with the drill. It's great how it gets around in close corners and in small fields. It plows right up close to the fence with every corner finished right. It turns on its own tracks.

With more than 2,000 lbs. draw bar. pull, and weighing only 3,700 lbs., model B does not pack the soil in cultivating or seeding. This combination of power with light weight means economy and a less expensive machine all around.

If you prefer a less powerful machine for smaller farm, Model A will meet your requirements.

MINARD'S "KING OF PAIN" LINIMENT

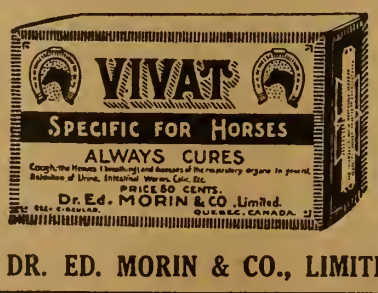
I was cured of terrible lumbago by
Minard's Liniment
—Rev. Wm. Brown.

I was cured of a bad case of earache by
Minard's Liniment
—Mr. S. Kaulbach.

I was cured of sensitive lungs by
Minard's Liniment
—Mrs. S. Masters

Manufactured by the
Minard's Liniment
Yarmouth, N.S.

The Recognized Specific of Diseases of the Horse



A sovereign remedy in powder form which cures, Coughs, Heaves, Colic, etc. It strengthens the work horse as well as the race horse, and enables them to do more and better work. It has been successfully prescribed by many veterinarians notably by Dr. J. D. Duchene, in many critical cases, where results have proved remarkable.

A 50c box will be sufficient for six days' treatment.

DR. ED. MORIN & CO., LIMITED, - - Quebec, Canada

HORSES OF BEST QUALITY ALWAYS IN DEMAND

There are many farmers who say the horse business is dead, but it would be far more true if it were said that it was only the interest in horse breeding in many districts in Canada, that is dead. "There is no where in Ontaria or Quebec where I can pick up a carload of drafters," was a remark lately made by one of Canada's greatest horse breeders and traders. A market can only be created where the desired article can be obtained. Until heavy horses are bred in sufficient quantity tnd of uniform quality, there never will be any demand for them in these provinces.

The Penalty of Neglect

Meantime, where such horses are bred in any number there is a keen demand for them, and the next few years will find the world confronted with a serious shortage of horses and consequent high prices. The price meantime has never been so high for geldings of the age and type, demanded for heavy draft quick movers. A decrease in the number of best class horses is a serious matter, and one that cannot be remedied in less than four years, and this only where there are plenty of breeding stock of the right sort. Even with plenty of breeding stock, then ecessary supply of work geldings cannot be raised in one year, it takes four years to make a work horse.

A serious mistake will be made if horse breeding is neglected in the near future or carried on with the same indifference as to market demand, as has been done in the past. The time is past when it will pay to produce the common light horse or scrub of any kind.

While good prices have been maintained for high class horses, the fact must be emphasized that each year finds city buyers discriminating more severely against inferior horses. Quality in the horses many Canadian farmers have been producing, has not kept pace with the increased demand for quality, upon the part of buyers and users, and they are now paying the penalty for this neglect in the form of inefficient work horse and a decidedly weakened demand for the average kind they have on hand.

No Fixed Idea in Horse Breeding

Not only is the poor type of horse unprofitable, but their influence is bad. There is always a lack of interest where the keen commercial element is absent. In the surroundings where grow up the scrub or mediocre type, there is no inspiration given to horse breeding, or opporunity to study horse market conditions. There are too many districts in Canada where farmers have no fixed idea in regard to their horse breeding operations. They forget that the most desirable farm horse is also the most desirable market horse. The prominent idea among farmers, that the horse that is not good enough for a market horse is good enough for a farm horse, must be discarded.

Motive power that is done with the unsound, poorly shaped, and undersized unmarketable horse is a most expensive item on the farm. The desirable market horse on the other hand, gives the motive power to the farm free of charge, and leaves a monetary profit over and above his services.

Keen Demand for Heavy Horses

There is a keen foreign demand for the best class of heavy horse just now, and it is likely to continue for several years. When the world settles down to business again and shipping becomes normal between nations, the horse trade will be the first to respond and the best horses will command very high prices. Calculating the future market on the state of the present for scrub stuff, will always place horse breeding operations at a discount. There can never be any demand in Canada for the best class of horse, till the best class of horse is bred here. Hired labor is made more efficient on the farm when the team is fit and heavy. The general tendency is towards a heavier and larger implements in order to cultivate deeper and speedier. The virgin vigor of the soil is leaving older Canada and the heavier horse is a natural consequence.

There is therefore greater economy in increasing the size of horses, rather than adding to their numbers. . Wider implements demand greater power and the most economical power available is the heavy draft horse, and the hired help with the aid of these can accomplish far more work than under conditions set around with a poor type of horses and antiquated implements.

The present state of affairs, in the economy of farm labor, is educating the forward and intelligent farmer to the necessity of having the powerful team, if he is to contend successfully with the need for greater producion, with lessened facilities of getting added hired help. On many farms the crop production is curtailed by lack of efficient horses and it costs less to develop a good horse than a poor one.

The demand for heavier implements has given an impetus to the increased demand for tractors, but there is room for both heavy horses and tractors in Canadian agriculture. The motor car can take the place of the light horse, but there has not a competitor entered field that can economically contest the place with the heavy horse.

Kind of Horse to Raise

Farmers can raise better horses than they can afford to buy, and they should devote more attention to this part of farm management. The deepest concern of the horse raiser should be the kind of horse he raises, for there are all too few that are bred and fed with sufficient care and thought to insure the development of the desirable horse.

To meet the market successfully the farmer must study the general industrial conditions carefully, in order to recognize the efficient type of farm horse. A well defined, correct ideal as to type and conformation is an absolute necessity before one can hope to succeed in raising profietable horses. Style, quality and action are desirable in draft horses, while substance is an absolute necessity. Drafters weigh from 1,600 lbs. upwards, the bigger the better, providing they have quality and finish, and are easy, snappy movers. Probably no horse is less in demand anywhere than the big horse without these qualities.

Scrub horses and old-fashioned tools are a drug on agriculture, and places rural life and enterprise in abeyance. Good horses and modern up-to-date equipment would draw the good hired men, and these alone are the only quality to be trusted with the spirited and highly bred drafter.

No branch of live stock breeding will return better profits than that of breeding the darft horse, when properly managed. This fact has been proven in every country where agriculture is successfully undertaken, and it seems strange that many farmers still persist in working geldings only half matured, and breed scrub horses that are not wanted anywhere. This is the reason why they complain that no buyers are around when they want to dispose of their surplus stock. If farmers would raise the good horses they would not have to look around for buyers.

Horsemen, Attention !

These are the Preparations which have helped to make Canadian horses famous.

They have many imitators but no equal.

POULTRY.

THE PASSING OF THE HEN

Tell me not in mournful numbers that
he hen is going by,
That she doesn't earn her "foder" as
the grain bills soar on high.
Every time the greedy magnate gives
the price of grain a boost
Means the closing of the hencoop and
the downfall of the roost.
In the world's broad field of battle, in
the stricken haunts of men,
They are crowding out the cattle and
the meek and humble hen.
And we've marked the disappearance
of our one-time friend, the horse,
As the puffing panting auto spins its
all uncertain course.

Our grave and learned scientists are
busy as can be,
Making substitutes for products erst-
while "Made in Germany."
Can it be the time is coming when
'twill be their happy boast
They can give the worud a substitute
for breakfast egg on toast?
How we'd miss the cheery cackle of
the plump Rhode Island Red,
The crowing of the chanticleer that
calls us from our bed;
Oh, the echoes round the homestead
will be void and empty when
The march of progress has declared
the passing of the hen.

[Katherine L. Danhier.

THE FIRST TWO WEEKS IN HISTORY OF CHICK HAS LIFE LONG INFLUENCE

Thousands of chicks die every year through the use of poorly constructed brooders anad through the poor management o fthe ir caretakers. After the chicks are hatched the success in raising them depends largely upon the care they receive during the first two or three weeks of their life. Many who raise poultry find brooding the hardest part of the business.

Be sure the brooder is ready to receive the chicks as soon as they can be taken from the incubator. A neighbor of mine once ordered one hundred baby chicks and when they came he had no place to put them. Of course he suffered a great loss and laid most of the blame on the man who sold him the chick. I may be a crank on brooding, but a chick well brooded can easily be picked from a flock that is not. The losses are smaller and the chicks thrive much better, thus repaying one for the extra work. There are several good makes of brooders on the market that can be purchased very reasonably, but to my mind a home-made one, if made the right way, will produce just as good results. I have used fireless brooders but during cold weather one needs artificial heat.

In making a homemade brooder take an old zinc tub, cut a hole in the middle of the bottom about three inches in diameter. Fasten four legs on the inside and let them extend three inches. Turn the tub upside down, letting it stand on the legs. This leaves enough room so the chicks can go in and out when they want to. Place an incubator lamp under the center, letting the chimney come directly under the hole that was cut in the bottom of the tub. Next take a piece of screen cloth making a cylinder out of it just large enough tot fit around the lamp. This keeps the chicks from getting too close to the heat. Of course a brooder of this sort has to be inside.

My brooding is done in small colony houses. They are made air tight; made of good siding and lined with plaster board, having a small window in the front covered with screen wire. In cold weather a muslin frame is also used over the opening. Where one does not want to go to the expense of buying plaster board, a covering of a good grade of roofing paper will answer the purpose and do just as much good. These houses are six by eight and will accommodate two or three brooders. Do not trust more than seventy-five chicks with each brooder.

A round brooder saves the lives of several chicks, because there are no corners for them to crowd in and trample the weak ones to death. The first lesson a chick must learn is where to get warm. A hen's body is sufficient to warm them quickly, so they do not need to be covered for long at a time. The first day or two they have to tbe watched closely to see that they find their way into the brooeder where artificial heat is supplied. It will not do to let them stay out too long, as they become chilled and get stunted. They soon learn where to go, and there is usually no further trouble.

As I said at the beginning, if a chick can be brought through the first two or three weeks of its life with its vitality unimpaired, successful rearing to maturity is practically assured. The beginners in poultry raising usually have their experience. They honestly belive that the chicks must be provided with food as soon as hatched, and they can not rest satisfied unless they are constantly stuffing the chicks with feed. If they would withhold all feed for forty-eight hours after hatching, the results they would obtain would be surprising, and the mortality would be reduced.

nI my experience I find that when bread and milk are used for the first meal and first few days' feeding the best results are obtained. They need something that is easily digested and is nourishing at the same time. Bread and milk is an ideal feed in this respect. The chicks relish it very much. Use only stale bread (never fresh), such that is dry and will crumble easily. Never wet it so it will pack, but use just enough milk in the mixing to elave the bread in a crumbly state. If possible never feed more at a time than they will eat up clean. When any of the soft feed remains, it should be cleaned up and removed immediately, as it quickly sours and becomes unfit for consumption. The best results are obtained by feeding often and sparingly.

The bread-and-milk method of feeding the first three days has a tendency to produce growth and give the chicks a good start. After this feeding for three days the chicks are given a good bone-and-muscle-forming feed, such as steel cut oats or rolled oats, as these are pure and wholesome. I much prefer them for the first two weeks. As the chicks should be kept busy, scatter their feed in chaff used for litter and let them scratch to find it. The litter should be about an inch deep, as such a depth enables them to get around easily, yet they must work for their feed. After the two weeks' feeding of oats, start on the regular prepared chick feeds. Always insist on getting the best of this feed as great mortality often results from the feeding of damaged grain. It is not advisable when using this feed, to omit all soft feed. Ground feed of some kind aids wonderfully in development. Either include a wet or dry mash. Where a large number of chicks are raised the dry mash system cuts down the labor in caring for the chicks and the rsults will be found to

Indispensable on the Farm

be just as good as when the moist system of feeding is used. When the moist system is used feed it twice a day and the grain feed three times a day. Bone meal mixed with the mash produces good results. When no meat feed is available, milk sould be substituted as it answers the purpose equally as well. Kepp it before them in a clean vessel.

Arrange the water vessels so the chicks cannot get into them with their feet as chilling will often result, thus causing bowel trouble. Where chicks are confined in yards they must be supplied with green stuff. Fine alfalfa meal mixed with the ground feed will answer the purpose, if no other can be had, although sprouted oats cannot be beaten. They sould be fed when quite young as they are then very tender. As the chicks become older the feeds per day can be decreased to three but the amount should be increased.—O.M. Allen.

PROLIFIC STRAIN OF LAYERS FROM HEALTHY HENS

Early attention to the selection of the breeding stock will assist materially in the building up of a good strain of layers. The hens for the laying of the hatching eggs should be chosen with just as much care a is exercised In the selection of males for mating. By careful observation before the breeding season begins, it is possible to note the strong points of the various hens and determine any tendency toward weakness. To get a prolific strain of layers, it is essential to choose only vigorous, healthy hens, prloific layers themselves and which have been bred in line from stock carefully chosen for like characteristics. Like tends to beget like, so that hens chosen from a single line of breeding, and possessing the desirable qualities of heavy layers will tend to improve and develop the strain in a highly satisfactory manner.

Where the flock is large and it has been necessary to arrange the hens and pullets in separate flocks for the winter there is an excellent opportunity to cull out the weaker and less desirable fowls and maintain them in a flock by themselves, while the vigorous hens intended for breeding may be hoosed in a separate enclosure. This arrangement makes it possible to confine the breeding flock within suitable enclosures during the time they are mating and their eggs are being saved for hatching purposes. Nothing pulls down the value of a good flock of hens quite so quickly aas to use eggs for hatching that have been laid by any and everything in the flock. Many infertile eggs and weak chicks are the result of carelessness in this matter. No male should be allowed to run with the poorer fowls. Infertile eggs will keep better and are better for the market.

In choosing the male birds it is necessary to keep well in mind their characteristice and breeding. Each generation of their offspring should tend to improve the quality of the strain. They should be physically well built, vigorous hens that have been bred in line from stock that has graded near to what you desire. Careful selection and breeding tends to develop individuality of character that may be maintained and improved upon with each succceeding generation. Nothing but the best should be admitted into the breeding enclosure. A small flock of well chosen hens will produce as many eggs as are required for hatching purposes. Then, too, if any eggs are offered for sale the breeder can truthfully recommend the quality of the eggs and the character of the offspring which they will get.

Building up a satisfactory strain of prolific layers is not the work of one or even two sessions, it is the culmination of a constant effort applied year after year along a definite line of breeding and selection, choosing each year, breeding stock which most nearly meets the requirements in every way sought for. nI the matter of producing eggs for hatching purposes, the breeder should be just as careful and exacting as though he were purchasing eggs to add quality to his flock. Pure-bred fowls of a standard variety will respond satisfactorily to careful breeding. Good care and feeding will do the rest.—P. H. EATON.

Make Your Buildings FIREPROOF and Practically Everlasting

Put in material that cannot burn, that is unaffected by any and every kind of weather, that cannot rot or rust, that will last for many years without repair. Use

PEDLAR'S CORRUGATED IRON SIDING

Then you will have buildings that are not only perfectly weather-tight, but that present a handsome appearance.

Pedlar's Galvanized Corrugated Steel Siding is the best quality obtainable—there is no better made. In fact, no better quality *could* be made. It is perfect.

Using Pedlar's Galvanized Steel Corrugated Siding is the truest building economy. It costs but little more than inferior material and gives a lifetime of service.

We manufacture steel siding in many forms, including handsome designs closely imitating brick and stone, which are ideal for re-covering frame houses.

MARKING OF CANADIAN EGGS FOR EXPORTATION

An Order-in-Council passed on 5th April, 1918, makes the following provisions as to the marking of cases containing Canadian Eggs to be exported from the Dominion:

"Every case containing Canadian Eggs intended for export out of Canada shall be marked on both ends in a legible and indelible manner, with the class and grade of eggs contained therein, and the words 'Canadian Eggs,' and every case containing eggs that are to be shipped from one porvince to any other province in shipments of 100 cases or more, shall be marked on both ends with the class and grade of the eggs contained therein, and with the name of the country of origin when other than domestic product. The Minister may from time to time prescribe the form and size of the letters that are to be used in such markings. Such marks may be accompanied by other trade designations or brands providing such designations or brands are not, in the opinion of the Minister, inconsisten with or marked more conspicuously than the marks prescribed in the regulations.

Canadian Eggs for export out of Canada shall be tightly packed in Canadian standard cases in new white fillers and flats, with kiln-dried excelsior or corrugated cushions at top and bottom, or one-third fillers on bottom with flats over tops and under bottom of filllers.

The mark of approval to be placed on each case, hereinafter called the "Government Mark," shall include the Maple Leaf and the words "Canadian Eggs" and "Government Inspected" together with the Inspector's Number, the device to be in such form as the Minister may approve.

No person other than a duly appointed Inspector shall apply any Government Mark to any cases containing eggs.

Collectors of Customs throughout Canada shall not allow any Canadian eggs to be shipped for export out of Canada that are not marked in accordance with the regulations."

HOW TO GET RID OF MITES

Be sure that the house is free from mites. These little pests get into the cracks and corners of the building and at night, as the hens are resting, they come out of their hiding place, get on the hen's body and it does not take very many of them to make a hen so uneasy that she cannot sit. In some cases the mites become so trobulesome that they actually worry the hens to death.

Clean out the house and thoroughly sweep, not forgetting the windows, walls and ceiling. When this is all swept out clean, use a garden hose or a stiff brush and hot water. See that everything in the cracks and crevices is washed out. After this is done allow the house to dry for a while and if everything then appears to be clean, use a good disinfectant and be sure that the solution is forced by the spray or brush right into the cracks and crevices. If the mites are bad, use boiling water followed by coal oil and a liquid lice killer or lice paint. Be sure that this goes into the cracks and crevices and when you have gone over your house thoroughly according to the above treatment, in all probability the mites will be exterminated, but it it advisable in the course of three or four days again to inspect for the mites and perhaps to repeat the dose once more.

PEERLESS GATES

Down the road or far across the fields is often an "entrance," a mere hole in the fence, a constant source of danger to stock getting through. The best way to

Keep Your Stock Where You Want Them

is to provide real gates, strong and durable. All Peerless Farm Gates are of heavy open hearth steel wire on strong tubular steel frames electrically welded in one solid piece, and **braced like a steel bridge.** No sag, no rust, no wearing out. Ask your dealer to show you Peerless Gates, also Peerless Perfection Farm and Poultry fencing with the famous Peerless lock at all intersections.

PEERLESS THE ALL AROUND FENCE

SEND TODAY FOR CATALOG. It tells you how to put up a fence to "stay put."

B., solicite your assistance in making this page a success and will be glad to publish tested recipes, household discoveries and other articles useful to the homemaker and women's organizations.

TOWARD LIBERTY A PRAYER

Now that we answer blow for blow
And courage takes the place of shame,
Now that we leave soft peace and go
Into a world of blood and flame.

Now that our patient faith becomes
A sword, and even fear turns brave,
O, God, let not the angry drums
Beat down the things we fight to save.

Let not our passion or our pride
Bring us disgrace by word or deed;
Knowing that though our wounds are wide
It is for liberty we bleed.

Preserve our hearts from poisonous hate,
That when we come to spend our youth,
We can give gladly in the great
Battles for tolerance and truth.

And we shall sacrifice and grow
Nearer our high and rousing aim,
Now that we leave soft peace and go
Into a world of blood and flame.

—Louis Untermeyer.

THE SONGSTER

Music, music with throb and swing,
Of a plaintive note, and long;
'Tis a note no human throat could sing,
No harp, with its dulcet golden string,—
Nor lute, nor lyre with liquid ring,
Is sweet as the robin's song.

"He sings for love of the season
When the days grow warm and long,
For the beautiful, God-sent reason
That his breast was born for song.

"Calling, calling so fresh and clear,
Through the song-sweet days of May,
Warbling there and whistling here,
He swells his voice on the drinking ear,
On the great, wide, pulsing atmosphere,
Till his music drowns the day.

"He sings for love of the season
When the days grow warm and long,
For the beautiful, God-sent reason
That his breast was born for song."

—E. Pauline Johnson.

HOW TO HAVE HEALTH AND COMFORT DURING HOT WEATHER

When autumn comes most of us sigh at the thought of summer departed and think regretfully of the many things which we had meant to do, but which each succeeding fall sees undone. I should like to suggest that we exchange afterthoughts for forethoughts and prepare for the coming days by planning what we hope to do while they last. I have a theory which I have frequently stated in these pages, that our failure to do the things we long to do is due as often to our own lack of effort as to untoward circumstances. So I think that we might make the most of the summer months and really feel when they are over that we had accomplished our desires if we would but put our wits to the tack o fwhat we want to do.

I suppose we all want to be out of doors in the summer. This northern climate insists on so many months indoors, that we feel constrained to make the most of the days when it is possible to be outside. Let us see how we can accomplish this first of our summer wishes. First of all, if this is not a contradiction of terms, we can bring the in-door air into the house. It seems as if it should be unnecessary to insist on fresh air in the house, but the fact is that there are few houses that are really open to the winds and air of heaven in the warm days, not to speak of the old ones.

Too few windows are provided with screens, or if screens are used they the small or inadequate ones. It is a laudable ambition to keep the fly out, but it is a pity to exclude the fresh air at the same time. Home made screens can be made at comparatively small cost, which fit over the whole lower half of the window, buttoning on from the outside after the manner of a double window. These are secure for the whole summer and do not interfere with the raising and lowering of the window, which can be put up as far as one pleases. Such screens should not be put merely on one window of the room, but on all the windows, so that the house can be as open as possible. This, of course means a cool house in the hot weather, but more important is the provision for the constant circulation of fresh air through all the house.

While the bringing the outdoors in is all very well in its way, to take ourselves out is far better. Yet how many people have fine verandahs on which they seldom sit. The verandah should find abundant use during the warm weather. To begin with, wherever possible, verandah balconies should be utilized for sleeping porches. Not that sleeping out of doors should be confined to warm weather, but most people will begin when the heat drives them out and then to continue when they discover the charms of sleeping in the open air. The sleeping porch should have a cover, but if there is no roof, an improvised tent can be made to serve the purpose. The porch should be screened, as anyone who has tried sleeping out when the mosquitoes are active will avow. People who are doubtful of the advantage of sleeping out of doors should try the arrangement to prove for themselves its value.

To eat out of doors is the next step of what may be described to different points of view as sane or faddish living. Do not say, lady of the house, that you have no time for such nonsense, for it is really no trouble if you manage properly. I shall never forget a farm home where I once spent an unusually pleasant Sunday and where all the meals were served out of doors. A large verandah opening off of the kitchen had been screened with wire netting. Here the table was set and here all the meals were served. It was no trouble to have meals out there and the food seemed doubly appetizing. When the meal had been cleared away, the place had been transformed into a sitting room. A hammock slung in one corner invited to rest, there were magazines scattered around, and on week days a sewing table was an important part of the furnishing. The verandah was the actual living room of the family all through the summer. The morning's work was done as far as possible out there, the afternoon's tasks or pleasures were carried out there also, the meals were served there, and at night some of the family slept there.

This is a convenient and economical arrangement as well as a healthful one, for the house itself was free from wear and tear all summer, and it needed practically no cleaning, whereas the cleaning of the verandah was a simple matter. All this was accomplished by putting a few dollars into wire netting to screen the place. The screening gave the protection so necessary against flies and mosquitoes, and also the privacy which is so desirable in such an arrangement.

All sorts of furniture suitable for porches can be purchased at comparatively low prices and each year sees prettier things for this purpose put on the market. It is quite possible to make the porch attractive with things borrowed from the house, but at the same time if one has any idea of buying it is well to have some idea of what is desirable. Avoid, above all things, fussy arrangements that are supposed to be decorative, mistakenly. Choose cool colors, and simple, easily adjusted furniture. Some of the swings and seats offered on the market are to elaborate to be satisfactory. Wicker furniture is perhaps the best buying, as it wears well, is not spoiled by the weather and is light and easily moved, an important consideration. Grass mats of the various kinds on the market are good for floor coverings if such are desired.

Green awnings may be necessary, but have proper ones and do not be beguiled by bamboo curtains or anything of that like. Green is probably the most satisfactory color to use in furnishings. Light covers may be made for cushions which will be needed in abundance if a comfortable porch is to be made. Pretty and inexpensive chintzes can quickly be run up into covers, and these may be slipped over the cushions, which, in other garments do duty inside the house in winter. Don't put any ruffles or furbelows on the covers. A broad hem stitched around is all that is needed by way of finish, and elaborately worked cushions are out of place in a porch where simplicity should be the dominating note. The covers should be made so that they can easily be slipped off and put in the wash when they get dirty.

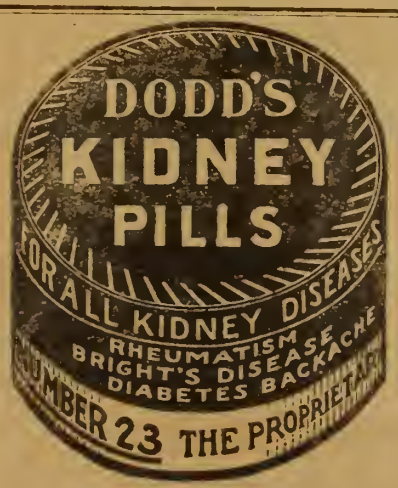
We have spoken of the absolute necessity of screening a porch which is to be in steady use if comfort is to be had. Scarcely less important is the matter of lighting. It has become general, wherever electric lights are had, to have a light on the porch. This is placed high up on the ceiling, is of no use for work and throws such a glare on the porch that its occupants are clearly seen by passers-by. Privacy is thus destroyed. In the new designs for furnishing porches are to be found tall lamps of wicker into which a light is dropped. This throws light on one's reading or sewing and still leaves the rest of the porch in a soft gloom. It is not necessary to buy one of these expensive lamps in order to carry out the same idea.

So much for the porch. In passing one might suggest that people who cannot or do not wish to make an outdoor living room of this sort might at least make the inside living room look summer-like on the same lines. Why not take down all heavy portieres and draperies and leave the room free, or else use in their stead, curtains of lighter, more summery wash stuff? Similarly, imposing embroidered covers on cushions might be banished for the summer and light, washable covers put in their place.

So much for the house, now a word about cooking. I would suggest first of all considering the meals so as to do away wherever possible with the work of cooking. First, vegetable should be used as far as possible and the garden should be the source of much of the housewife's summer supplies. Vegetables may be used in salads or cooked, but this does involve heavy work. It is often possible to distribute the tasks so that the children will gather and clean the vegetables for each day before they go to school or play. It will be good training for them to be responsible for this duty and it will lighten the work of the mistress. Then cooked desserts may be almost banished from the table, fresh fruits taking their place. In the early summer, oranges and bananas can still be had and later there are the small fruits which we will hope the garden supplies. This would greatly simplify the preparations for the main meal of the day.

For supper there should be a corresponding change in the character of the food served. Potatoes, if they still find a place on the table, will probably be more welcome in a salad than fried. And other salads should also be used. There is an unfortunate prejudice against salads in this country, which is largely due to the fact that they are not largely used. It is a pity that people should not try them more freely for they are not expensive, they are easily prepared and are particularly wholesome in hot weather.

I suppose it is carrying coals to Newcastle to suggest to people who live in the coutnry that the early morning is the best time to work, that it pays to get the heavy work done then and to rest in the heat of the day.



RELIEF AT LAST

I want to help you if you are suffering from bleeding, itching, blind or protruding Piles. I can tell you how, in your own home and without anyone's assistance, you can apply the best of all treatments.

PILES TREATED AT HOME

I promise to send you a FREE trial of the new absorption treatment, and references from your own locality if you will but write and ask. I assure you of immediate relief. Send no money, but tell others of this offer.

NEVER NEGLECT
BRONCHITIS
IT MAY TURN TO PNEUMONIA.

Bronchitis comes from a neglected cold, and starts with a short, painful, dry cough, accompanied with rapid wheezing, and a feeling of oppression or tightness through the chest.

You have, no doubt, wakened up in the morning and have had to cough several times to raise the phlegm from the bronchial tubes, and have found it of a yellowish or gray, greenish color, and you have received relief right away.

This is a form of bronchitis, which if not cured immediately may turn into pneumonia or some more serious trouble.

Cure the cold with Dr. Wood's Norway Pine Syrup and thereby prevent bronchitis and pneumonia taking hold on your system.

Mr. E. Jarvi, New Finland, Sask., writes:—"I was troubled, for years, with bronchitis and could not find any relief. I was especially bad on a damp day. I went to a druggist, and asked him for something to stop the cough and constant tickling in my throat. He gave me a bottle of Dr. Wood's Norway Pine Syrup, which I found gave me instant relief. I think it is the best medicine for bronchitis I know of. Now I take care I always have a bottle of it on hand."

Do not accept a substitute for "Dr. Wood's." It is put up in a yellow wrapper; 3 pine trees the trade mark; price 25c. and 50c.; manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

FIRST AID IN THE KITCHEN

Mends Leaks in Graniteware, Tin, Aluminum, etc., in two minutes without tools. Saves a kettle for half a cent. At dealers or from us, 15 cents.
Vol-Peek Co., Box 2024, Montreal, Can.
VOL-PEEK

However,, I allow the suggestion to stand for the benefit of those town dwellers who may chance to fall upon these lines and, let us hope, be saved from sloth by such excellent advice.

But, speaking of the question of rest, might it not be possible to save a part of each day for rest or amusement, a sort of summer day in instalments? Almost anything can be accomplished by determination and careful planning, and I think even this might be done if the day's work was planned with that in view and the time for rest as jealously guarded as that which we devote to work. The trouble, I fancy, is not so much that people can't find time to rest but that their consciences will not let them rest. I do not mean to suggest a guilty past, but rather that we have developed such a genius for work that we feel as if we were doing something wrong if we idled for one minute. Pray remember that whenever you rest you are simply storing up energy for use in times to come and that may justify you in the taking of a much needed holiday.

I believe that most of our women work so steadily and so hard that they do not realize how tremendous is the drain on their strength. They do not know what it means to be really fit for work, nor do they realize how dangerously close they are to the end of their resources until something happens to use up their last bit of energy. Then the crash comes, for which they have been totally unprepared, and which might have been avoided by a little caution at the beginning.

We may all take warning from the alarming number of nervous breakdowns which we see all around us. Of course no one expects a thing to happen to her, but it is well to be forearmed. A little common sense in avoiding steady overstrain might avert many serious breakdowns. I know that I am writing to many women who need this advice more than they possibly realize. Will you not remember that the price of overwork is heavy beyond all others and try to make this summer yield you, in spite of the work which the busiest season of the farm year is bound to bring, a little rest and pleasure in its opportunities?

THE OLD FURNITURE DOCTOR.

With Varnish, Patience and Elbow Grease She Puts Shabbiness to Rout

By Henry Wangner.

To attempt to make old furniture, floors and woodwork look like new requires time, patience and materials of the best grade. Without these three, disappointment will result. You can, however, refinish all woodwork, stained or painted in a very satisfactory manner if you will bear in mind a few simple rules.

FIRST—All varnishes and enamels are transparent. Therefore before applying them the woodwork or piece of furniture should be carefully prepared.

SECOND—It is better to put on two coats of thin varnish than one heavy coat. If the varnish flows on and spreads quickly, like an oil, it is all right. But if the brush draws or sticks, it needs thinning. To do this add turpentine, a few drops at a time, until you secure the easy, oily flow. Should you get it too thin, this does no harm. It will, in fact, make the varnish dry more quickly, but, on the other hand, will doubtless necessitate the use of three coats to insure the desired effect. A two-inch bristle brush should be used for varnishing.

THIRD—Each coat must be absolutely dry before applying the next and must be rubbed lightly with number 00 sandpaper. The room where varnishing is done must be warm, free from dust and from drafts.

FOURTH—Always begin your work in the corner of the piece. With your brush first carefully fill in and cover the corners at each end of the strip you are at work on. Then, with long strokes, sweep across. Begin at the top of the furniture and work down.

Cool, Clean, Convenient Oil Cook Stove

WHEREVER a can of coal oil can be carried to, there you can have the cool, clean comfort of the McClary Florence Oil Cook Stove which does everything a good cook stove ought to do, and does it as easily, as cleanly and as conveniently as the best gas stoves. No valves or wicks. Just an automatic feed that vaporizes common coal oil into gas that burns with a concentrated, hot blue flame—under perfect control all the time.

You can cook a big meal in perfect comfort even in a small kitchen, in hot weather.

Had Heart Trouble

For 5 Years.

WOULD GO INTO FITS.

Through one cause or another a large majority of the people are troubled, more or less with some form of heart trouble.

Little attention is paid to the slight weakness until the heart starts to beat irregularly, and they suddenly feel faint and dizzy, and feel as if they were smothering.

On the first sign of any weakness of the heart Milburn's Heart and Nerve Pills should be taken, and thus secure prompt and permanent relief.

Mrs. W. H. Ferrier, Kilbride, Ont., writes:—"I was troubled with my heart for five years, and was so bad it would send me into fits and smothering. I could not do any work while I was affected, but after taking three boxes of Milburn's Heart and Nerve Pills, I have regained my health."

Milburn's Heart and Nerve Pills are 50c. per box at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

FIFTH—Remember that varnish runs. Watch carefully for any indication of this while the varnish is wet, as nothing can be done after it is set. If you detect a drop or a running streak, quickly and carefully brush across, after wiping the brush on the edge of the can as free from varnish as possible.

SIXTH—Always choose a warm room for the work of refinishing. It should be free from drafts and the windows on no account must be opened, for fine particles of dust will settle on the wet varnish and spoil its smoothness. Having learned these rules, now prepare the furniture. Every article of furniture or woodwork to be revarnished, or re-enameled or stained, should be cared for in this way: Wash the article of furniture thoroughly with water and very little soap. Then dry thoroughly. Now wrap a soft cloth around a sharp-pointed stick to reach into all the corners and carvings. It may be well said that if you take good care of the corners, the rest of the piece will almost finish itself.

After the piece of furniture is dry, sandpaper carefully with number 00 sandpaper. Be very careful to work only with the grain of the wood so that no cross-scratches will show. Be sure that you get a smooth surface. Now dust the furniture carefully with a soft duster. If the room is warm, you are now ready to varnish.

If your piece of furniture is of mahogany or any other good wood, of which you do not wish to change the color, all that will be necessary is to revarnish.

After the furniture has been prepared as directed, apply a thin coat of furniture or interior varnish, carefully and not too heavily. Allow this coat to dry thoroughly. This requires two days at the very least. The piece of furniture is now ready for a second sandpapering. Do this lightly until all gloss has disappeared. Apply the second coat of varnish as carefully as possible and allow it to stand until dry. Four days is not too long a time for this. Never hurry this part of the work.

If a glossy finish be desired, the work may now be considered finished but if the dull or "rubbed" finish be desired, the furniture must have further treatment. A piece of soft felt or cloth is necessary, a peice of an old, soft felt hat being excellent. Buy at any paint store a few cents' worth of powdered punice-stone. Mix this with a small amount of any good machine oil until it forms a thin paste. Now apply this mixture to the furniture by dipping the felt in it and rubbing carefully back and forth—back and forth—always in one direction. Continue this until all gloss has disappeared and the surface is perfectly smooth. Now rub with a dry, clean cloth, and a rich dull finish will be the result.

Should the furniture have carvings, rub over with the punice-stone and felt. Then wrap a soft cloth about a very sharp, thin stick and dig in around the crevices. Continue until all these parts are dull and smooth. Then rub with the soft dry cloth.

Should the furniture have cravings, rub over with the pumice and felt. Then wrap a soft cloth about a very sharp, thin stick and dig in around the crevices. Continue until all these parts are dull and smooth. Then rub with the soft dry cloth.

If you have a genuine piece of old mahonany, rosewood or any valuable wood, and if (as so often happens) this has been varnished again and again until the varnish is thick and heavy, purchase a can of varnish remover at any paint store. Apply a coat of this and let it stand for 15 minutes, then with a broad-bladed putty-knife, scrape off varnish. If all the varnish does not come off easily, apply another coat of the remover and proceed as before. When all the varnish is removed, sandpaper well and carefully with number OO sandpaper until the surface is smooth. Now proceed exactly as directed when varnishing furniture, using three coats of varnish. To give this furniture what is known as a "piano" finish, after the last coat of varnish has completely dried, mix a thick paste of powdered pumice stone and cold water. Rub the furniture with this until all gloss has disappeared from the varnih and the sufrace is smooth. Have ready a paste made of rottentsone (purchase a few cents wort hat any paint store) and cold water and rub with this until the surface appears even smoother than before. Then wash wiht a sponge dipped in clear, cold water and dry with a perfectly clean piece of chamois. Then polish with good furniture polish applied with clean cheese-cloth. Rub until a high finish is obtained. This is the "piano finish."

I would state, however, that this finish is difficult for an amateur to obtain, for this reason: An inexperienced person so often, while rubbing with the pumice stone and rottenstone pastes, rubs through varnish. If you like you can apply to this old furniture a "waxed" finish instead of either a rubbed or piano finish. After the old varnish has been removed do not ap ply any varniish. Instead, apply a coat of thin shellac. Shellac however, dries so rapidly that the work must be executed with the greatest dispatch.

If the shellac is too thick to flow freely, add a small quantity of wood alcohol, a few drops at a time, in the same manner as when thinning the varnish, trying it with a brush (as in the varnish) until it flows easily. Use a two-inch bristle for this. When the coat of shellac is thoroughly dry, sandpaper with number OO sandpaper very lightly and carefully. If the grain of the wood does not appear to be well filled with the shellac and the surgace is not smooth, apply a second coat of shellac evenly. Sandpaper this second coat and then apply prepared wax, which may be secured at any paint store. Apply this with a soft cloth and rub until an even surface is secured. When the wax is dry, polish with dry cheese cloth.

A fresh coat of wax may be applied as often as one desires to make the furniture look fresh. This is the finish that our ancestors admired and many a small colored boy and girl has spent hours polishing "ole massa's" furniture to obtain it.

To refinish a chair that has been stained to imitate some other wood, the best results are abtained by purchasing a stain of a little darker color than that on the chair. This may be obtained at any paint shop or department store's house furnishing department. It must be stirred well before using. Wash and sandpaper this furniture with the same care and in the same manner as described above. When dry dust with a soft duster and

Grand Old Man Makes Statement

MR. GEO. SOMERS FINDS DODD'S KIDNEY PILLS BEST

In His Eighty-second Year He Tells Why, After Trying Other Medicines, He Pins His Faith to Dodd's Kidney Pills.

Barrie, Ont.—(Special.)—Mr. Geo. Somers, Barrie's grand old man, now in his eighty-second year, has made a statement in regard to Dodd's Kidney Pills, Canada's grand old kidney remedy. "I have tried several kinds of kidney pills," Mr. Somers states. "I have arrived at the conclusion that Dodd's Kidney Pills are the best so far; ta least they have given me the best satisfaction. I have taken them for nearly twenty-five years off and on as I have needed them."

Mr. Somers, who for forty years before retiring was a carriage worker, strained his back while gardening, and for over twenty years has been troubled, more or less, with his kidneys.

That he has pinned his faith to Dodd's Kidney Pills after trying the other kinds is considered a splendid tribute to the grand old Canadian kidney remedy. At his advanced age he is splendid evidence of the good work Dood's Kidney Pills are doing.

apply the flat stain with a one and one half inch camel's hair badger or ox-hair brush. As this stain dries very quickly, finish each part commenced before getting a second. For example if you begin a leg of the chair, finish its entire length. Otherwise, since the stain dries so rapidly, it will show where you left off work. When the chair is stained and dry, proceed as for varnishing and finishing. It is difficult for an amateur to get successful results in changing the color of furniture. Should you desire to do this, however, try to make the new color in harmony with the old one. For example, if your chair be cherry or mahogany, purchase a dark mahogany or rich brown. If it be light oak, however, almost any color will work in well.

One other hint in conection with using stains. By rubbing lightly with a soft cloth while the stain is wet, some of the stain will rub off, giving a shaded effect. This is especially effective on woods having a well-marked grain. Do not be afraid to use this cloth while the stain will rub off, giving a shaded effect. This is especially effective on woods having a well marked grain. Do not be afraid to use this cloth while the stain is wet. The color may so easily in this way be made lighter or shaded. But if once the stain becomes dry the color is set and must remain so.

LET a woman ease your suffering. I want you to write, and let me tell you of my simple method of home treatment, send you ten days' free trial, postpaid, and put you in touch with women in Canada who will gladly tell what my method has done for them.
If you are troubled with weak, tired feelings, headache, backache, bearing down sensations, bladder weakness, constipation, catarrhal conditions, pain in the sides, regularly or irregularly, bloating, sense of falling or misplacement of internal organs, nervousness, desire to cry, palpitation, hot flashes, dark rings under the eyes, or a loss of interest in life, write to me to-day. Mrs. M. Summers, Box 309 Windsor, Ont.
A MESSAGE TO WOMEN!!

GROWING THE FRIENDLY FLOWERS

Friendliness of all the unpretentious garden flowers is the pansy, ready each morning to brighten the breakfast table, blossoming most freely when freshly cut. The culture of the pansy is simple, and the results are sure. It asks only a fairly rich, cool soil, and protection from the noonday sun, with plenty of water in a dry season. Shade from noon until three o'clock in the afternoon is desirable, but if there is too much shade the blossom will be small. To raise one's own plants it is necessary to start the pansy seed in the house in February, transplanting to the open ground in May. As the weather grows warmer water should be given in abundance. It is most important that all the old blossoms should be picked. To maintain the vigor of the plants, cut them all back in July.

Perhaps nasturtiums come next in the list of friendly flowers. Few plants are less exacting as to soil. Really a rather poor soil is better than a rich one, for rich ground causes an immense growth of foliage, but at the sacrifice of bloom. One reason we have a friendly feeling for nasturtiums is because they lend themselves so well to house decoration. Great bowls of them brighten and glorify the living room, and one never need fear a clashing of colors, for all the shades in which the nasturtiums are found harmonize wonderfully well.

Sureyl mignonette, sweet alyssum and candytuft must be counted too. They like fairly rich soil and object to being moved, so they should be started where they are to grow all summer. Seeds may be sown early in May and pressed into the ground very lightly. Several later plantings of mignonette are advisable in order to have a long succession of the sweetly scented flowers, and care must be given to the cutting of the flower spikes, for if the seeds are allowed to ripen, the plants will stop flowering.

The petunia also makes an irresistible appeal to everyone. Seeds may be sown in May and thinned to six inches. Early plants are secured by starting seeds in the house in March. The seeds are very small and should be barely covered with soil.

Bachelor's buttons must not be overlooked. They are generous with their quaint bossoms the whole summer through. Seeds should be sown in March or April and the plants thinned from four to six inches. The best way to get very early blossoms is to sow the seeds in the fall, covering the beds lightly with leaves during the winter.

The sweet-pea is the spoiled darling of the garden. It gives its best only to those who are willing to pamper it. If you would try to win its friendship, plant the seeds as early as the ground can be worked in trenches, but first dig over the soil to a depth of two feet. Make the ground rich by using sheep manure and wood ashes—stable manure breeds cutworms—and when the vines are up train them on brush.

To get on really friendly terms with poppies, plant a bed of Shirleys. Then get up early enough to watch them unfold in the dewy freshness of the morning. The tightly closed buds open so daintily that you watch them with a pleasure rare to a garden enthusiast.

Poppies give color to a garden all summer. The annuals should be planted in a sunny spot and covered very lightly.

Last on the list let me place cosmos, that delicate fall flower which seems to beg for our friendship by brightening the close of the garden season. It is best to start the seeds in the house and to give the plants a sheltered position from high winds.

Rock these Grates

"Shaking down" a range fire has gone out of fashion. Kootenay Range duplex grates need only be rocked gently.

If you have used the old fashioned jolting shaker you will hardly believe the fire is really shaken down when you rock the Kootenay duplex grate.

Kootenay range grates let all the ashes fall into the ash pan but they keep the clean hot fire in the firebox.

No ashes can cling to any part of Kootenay Grates. That is why you get a clear fire and the full benefit of your fuel.

"Service in the Kitchen." Booklet Free.
This is only one of many features of the Kootenay Range described in a beautiful little booklet, "Service in the Kitchen," which will be mailed free on request. It tells all a woman wants to know about a range before she buys it.

THE VALUE OF FRUIT AS A FOOD

All our cultivated fruits have a history behind them, running back to the time when the earliest gardeners picked out the best species from the wild and transplanted the tree or bush to a plot in the home grounds.

Delicately flavoured apples or juicy seedless oranges are the result of hundreds of years of painstaking effort. Improvements in size and quality have come through careful selection, aided by chance cross fertilization, which gave rise to new types. Each advance made, gave encouragement to further effort and so great have been the transformations that it is difficult to trace most of the modern forms back to the original species.

Fruits are divided into two classes —flavored and food fruits. Food fruits contain more than 20% solids; flavored fruits are apples, pears, quinces, oranges, lemons, lime, etc. Food fruits are prune, date, raisins, banana, fig, etc.

The fig is highly nutritious owing to the large amount of sugar in its composition. It is a laxative food. Banana is also highly nutritious. It is reported to yield more fruit to the acre than almost any other plant; one cluster

may have from 160 to 180 bananas. There is a banana meal which is made from the unripe banana. It is dried, ground and used in making bread.

Peaches are not nutritious, but are valued for their delicate flavor. Since they contain little sugar they are valuable to a diabetic patient. Olives are used as appetizers. They are gathered before they are quite ripe, steeped in lime water and pickled in brine to remove disagreeable taste. We obtain olive oil from the olive.

The apple, the king of fruits, was in its original wild form, small in size, often very acid or bitter and indigestible, and not much like the splendid apple that we have with us nearly all the year round which is so agreeable to the palate. How ever strawberries happened to be named, whether they were strung on straw and sold originally thus in lands across the sea, or whether they are so called because they need a heavy mulch of straw to bring them to perfection, matters not. They are considered universally "The Queen of Berries," and have a most important place in the early summer diet. The chief quality of strawberries is the acid; they contain one of the strongest fruit acids found in nature. This national tonic is most beneficial to the still sluggish blood left by winter's temperature, and is appreciated and enjoyed by most people. One of the benefits of this natural acid is lost if the fruit is cooked. It is unquestionably a fruit to be eaten raw.

If cooked, however, it is best to make a syrup first, dropping the berries in only at the last moment. This will preserve their shape, but most important, their flavor.

The cranberry, most persons regard as an adjunct to their Thanksgiving or Christmas dinner. Few think of it as a tonic provided by Mother Nature to cleanse and purify the system during the long winter months, when few fresh fruits are available. From the Arctic regions, southward, this fruit is greatly valued and appreciated. During the nightless summer days the Scandanavian peasants make it their business to gather the red berries and string the min long chains for drying for the winter season.

In Russia the berry is used in wine making, while in many foreign countries it serves for making poultices which are applied externally for the purpose of removing inflammation. Few ships leave winter ports during the winter months that are not supplied with a goodly stock of these berries.

The cranberry should indeed be more widely used, not alone on account of its medicinal properties, but because of its culinary possibilities which are more numerous than is generally supposed. Not only does it make excellent sauces, puddings, pies, etc., but it may be used for jams, syrups and vinegar.

Fresh and cooked fruits hold an unique place in the dietary. Too often fruit is considered as simply a luxury for occasional rather than daily use, but the judicious use of both fresh and preserved fruits means better health and satisfaction for each member of the family. If possible, fruit should be served for breakfast. Each fruit has a season at which it is at its best and cheapest, then it is that the house wife, with an eye to future needs, is desirous of storing up a supply against a day of scarcity.

Sciatic Pains *from* Exhausted Nerves

SCIATICA or sciatic rheumatism is attended with pain and tenderness along the sciatic nerve in the hips and thighs, and indicates an exhausted condition of the nervous system.

Relief is sometimes obtained by external applications or the use of heat, but at the slightest provocation the distressing pains return and from time to time become more severe as the nervous system becomes more exhausted.

The only way to obtain actual cure is by a reconstruction of the wasted nerve cells, and this is best accomplished by Dr. Chase's Nerve Food. It need not cost you much to restore vigor to the nervous system, but it will take a little patience. particularly at first. After you have used a few boxes and got the building-up process established you will find improvements from day to day which will encourage you to keep up this treatment until the nervous system is completely restored.

Nervous disorders do not right themselves, but naturally, become more acute as the system becomes further exhausted. It is only wise to be warned by sleeplessness, headaches, neuralgic and sciatic pains and to take immediate action to restore the depleted nerves before paralysis, lacomotor ataxia or some form of helplessness is developed.

Dr. Chase's Nerve Food

50 cents a box—do not pay more—at all dealers or Edmanson, Bates & Co., Ltd., Toronto. On every box of the genuine you will find the portrait and signature of A. W. Chase, M.D., the famous Receipt Book author. 10

CLEAN HANDS

Mothers who wish their little onos to keep clean hands must set the example. Children are quick to notice other hands after their attention has been directed to their own.

I know a teacher who was very successful in inspiring her little pupils to keep their hands clean. She taught them to look upon their hands as wonderful and valuable tools that had been given them to do their work with. And that hands must be kept in good order just as tools must be kept in good order to do the things learned that soiled hands spoiled their work in school.

Dirty hands are not fit to touch clean food with.

Black flinger-nails are full of germs.

Sticky fingers ruin good books, and dirty hands should never be allowed to turn the pages of a coveted picture book.

A small scrub brush, a short orange wood stick, a little file and a small sized buffer at home will do much to awaken in the child a desire to keep the hands clean. If these litle instruments are given to him for his very own at an early age, they form just as fixed a habit as a toothbrush.

He learns to use them with neatness and dispatch and comes into the dining room promptly as well brushed and scrubbed and manicured as the grown-ups and just as proud of it.

INDIAN PUDDING WITH MERINGUE

Put one quart of fresh milk into a double boiler and when it reaches the scalding ponit sift in four tablespoonfuls of fine corn meal mixed with the same quantity of wheat flour. Stir thoroughly and cook two hours. When done, set off the stove and cool.

Add the yolks of four well-beaten eggs, a tablespoonful of butter and a teaspoonful of salt. Bake a delicate brown. Take from the oven, and when it has cooled slightly, spread with a meringue made from the whites of the eggs, beaten stiff with four tablespoonfuls of pulverized sugar. Use a wire whip or fork for making the meringue.

Set in the oven, which should be cool, and brown.

Farewell, oh luscious rhubarb pie,
From you we now must part;
Wen cannot put a fornight's sugar
All in a single tart.

HOW WE CAN DO WITH LESS SUGAR

In the daily menu and because of its low cost in the past, many persons have used sugar thoughtlessly, putting two teaspoonfuls or two lumps of sugar in coffee or tea, not being particular whether it was stirred until dissolved or not. This does not apply to the home tabel alone but when dining out. Use one teaspoonful and stir until all is dissolved, and if not sweet enough add a half teaspoonful more. Thy this and you will find it proves just as satisfactory.

When making puddings which call for hard sauce, where butter and sugar are the main ingredients, make a plainer sauce with very little butter and half the amount of sugar. It will be better for one's health; besides you are adding to the sugar supply of the world.

Instead of covering top and sides of the cake with icing to which nuts, fruit and flavoring have been added, ice only the top, or, better still, put the nuts on the inside of the cake and bake a nice brown and do without the icing, thereby saving sugar, white of egg, labor, and the cake is just as good. Many times one has bad luck, as some call it, and the icing is sticky and there is more on the knife than on the piece of cake, and the result is that it is wasted.

If for the next six months every cake that is baked would be made without icing think of the sugar saved!

If layer cake is made put it together with homemade jelly, jam or marmalade; and if a change is wanted add a few finely chopped nuts to the jam; and if for any reason one wishes to decorate the cake spread the top and sides thinly with red jelly and sprinkle with a little grated cocoanut or finely sliced blanched almonds.

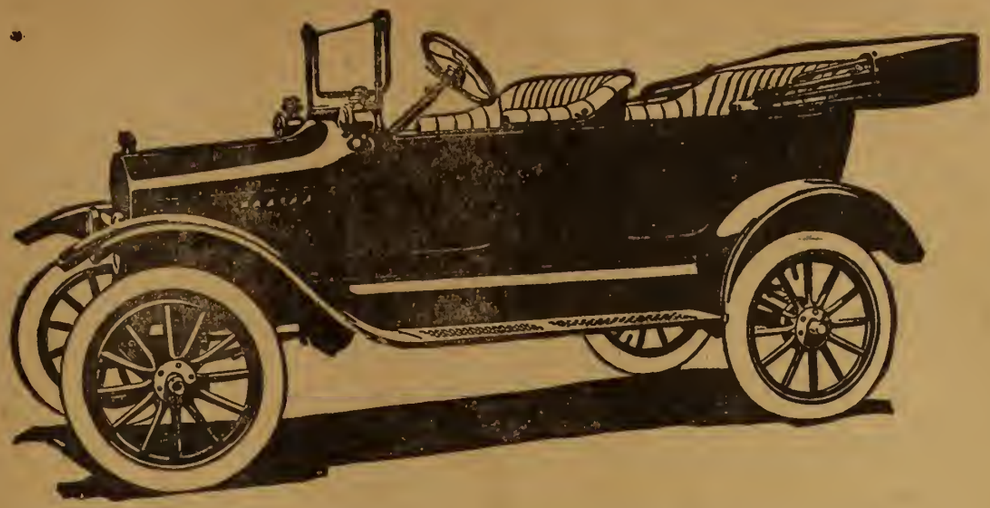
Why not make cookies for a change? It is a little more work, but almost everyone enjoys homemade cookies. Some can be made with half the amount of sugar, using molasses or honey.

THE CLEANING MANIA

A kind of insanity on the subject of cleanliness from the standpoint of much scrubbing, shining, and polishing, is common among housekeepers. But in real value conspicuous cleanliness does not weigh nearly as much as other less noticeable things. Handwashing, for instance, for all the family, is far more important than dusting. That the children should learn to keep clean hands means ceaseless work on the part of the mother, for probably no child ever lived who took kindly to much washing.

But hands are used for so many purposes that they come constantly into contact with things clean and unclean. A family where the children are taught and carefully watched to see that they eat with clean hands, handle foods with clean hands, and keep unclean fingers away from their mouths at all times, is getting far better training and is in all essentials a cleaner family than one in which these details are overlooked, but which maintains the furniture in a high state of polish. I can hardly emphasize this matter of hand-washing enough when I think of habits common enough among those we employ as house-help, of coming from the toilet and, without even a pretense at cleaning, going to cut bread, or, after nose-wiping, going right on with mixing of dough. It is exceedingly unpleasant to talk of such things, and so such subjects are seldom mentioned, but it is through the elimination of these and not upon shining that the real sort of cleanliness depends!

And with Summer on the way, one last word. Never let go your war upon flies, vermin, and pests of all kinds. No house can be clean that harbors them. A score of flies in a kitchen will hardly be noticed, but they have more possibilities of filth than dust and litter.



A Ford Car Takes the Place of all These Things

WHEN you own a Ford you can do away with many articles that are a source of continuous expense to the man who still drives a horse. For instance, not only your driving-horse and buggy, but the single harness, blankets, whips, currycombs, brushes, horse-shoes, pitch-forks, feed-bins, etc.

In their place you have a speedy, dependable, dignified, roomy Ford Car—complete in itself. It is vastly superior to the narrow, cramped buggy that travels so slowly. And when a Ford is standing idle it does not eat three meals a day, and it requires no "looking after."

A Ford will save you time, trouble, and money. It is the utility car for the busy farmer and his family.

INSECT PESTS AND SOME PLANT DISEASES

Everybody realizes that everything must be done during the coming year to increase production of staple articles of food, and one of the best means of conserving production is to control the insect pests and fungous diseases that prey upon the crops and destroy such a large percentage.

It is very important, that ample supplies of the neecssary chemicals be laid in early in the winter before the season arrives for their application. The reason for this is obvious, for during the winter the chemicals are cheaper and are more readily secured than in the spring when there is a larger demand for them.

The substances that every farmer should have on hand are **arsenate of lead, Paris green, copper sulphate or bluestone, unslaked lime or stone lime, unslaked lime, tobacco extract and insect powder.** During these war times arsenate of lead is much cheaper than Paris green and as a rule is to be preferred when a poisonous substance is to be applied, as for the control of potato beetle, codling moth, etc.

In the case of potatoes it is always advisable to use a combination insecticide and fungicide for the control of both beetle and blight, and three pounds of lead arsenate should be added to forty or fifty gallons of Bordeaux mixture solution.

Sucking insects such as plant lice and bugs of various kinds, are very common pests. With these arsenic or Paris green is of no value, but they can be killed by the application of soap solution or tobacco extract, or a combination of both. There is no better method of treating plant lice than by spraying the affected plants with one of these substances.

The chief remedy against plant diseases is Bordeaux mixture which is prepared by dissolving four pounds of bluestone in four or five gallons of water, and slaking four pounds of stone lime in a similar quantity of water, then pouring each of these solutions in turn, into a larger barrel containing thirty-five gallons of water.

Cabbage Plants

OF all leading early and late varieties 45c per hundred, mail prepaid. $2.50 per thousand, express collect. Also cauliflower, brussels sprouts, celery, onion and Tomato plants. Ask for price list.

HEROLD'S FARMS, Fruitland, Ont.
Dept. L Niagara District,

POINTS ON THE CULTIVATION OF SOME VEGETABLES MOST DIFFICULT TO GROW.

Cauliflower, although one of the most delicious vegetables, is one of the hardest to grow in many parts of Canada. It damps off easily in the hotbed, is often badly affected by root maggot and frequently does not head well. In raising plants, transplant them from the seed row, pot or flat to a distance of about two inches apart each way as soon as possible after the seed germinates. This permits a freer circulation of air between the plants and makes the danger of damping off much less. Root maggots are bad nearly every year in many places in Canada and often prevent practically all the plants from heading. Eggs are laid on the ground near the plant which soon hatch into maggots which eat into the roots and thus cut off the supply of sap. To prevent injury from these, a tar felt disc should be placed around each plant close to the ground at the time of planting. It will be too late otherwise. Full particulars in regard to the use of the disc can be obtained from the Department of Agriculture, Ottawa. If the first planting of cauliflower is a failure, a second planting should be made, as cauliflowers are much easier to grow in late than in earlier summer as the maggots are not so troublesome at that time and there is usually an abundant supply of moisture. If the soil in which cauliflowers are growing is dry, they will not head well, as they need lots of moisture and must be kept growing without a check from start to finish.

The onion is another rather difficult vegetable to grow. It requires a long season of growth and very often the seed is sown too late and if the summer is cool and wet the onions will not ripen and will run to thicknecks. The seed should be got in the ground as early as possible in the spring so that the onions will mature while the warm weather continues, thus ensuring a thorough ripening and curing of the bulbs. To hasten the development of bulbs, especially in places where the season is short, young plants are set out instead of the seed being planted. Onion sets will ensure good bulbs also where the warm season is short. Root maggots often do much harm in the onion plantation. Watering the rows every four or five days with hellebore and water in the proportion of two ounces of hellebore to one gallon of water while the insects are most troublesome will control them to a considerable extent.

Except in the warmest parts of Canada melons require considerable care to ensure the ripening of many of them. The warm season is too short. To overcome this, melons should be started in hotbeds and kept under glass until there are warm nights in June or even July. Melons require heat below and heat above, hence the necessity of keeping the soil warm by having a good bed of manure. They will not succeed in cold soil even if the air above ground is warm. Melons require a plentiful supply of moistrue in the soil to give the best results. Much watering, however, should be delayed until the ground is sufficiently warmed up so that heavy watering will not cool it too much.

Brussels sprouts do not develop well in hot, dry weather and, unless the autumn is a long one without severe frost, they are not satisfactory. It is important, therefore, to plant varieties that will be most likely to develop where the season is short, and the dwarf ones have been found the most satisfactory.

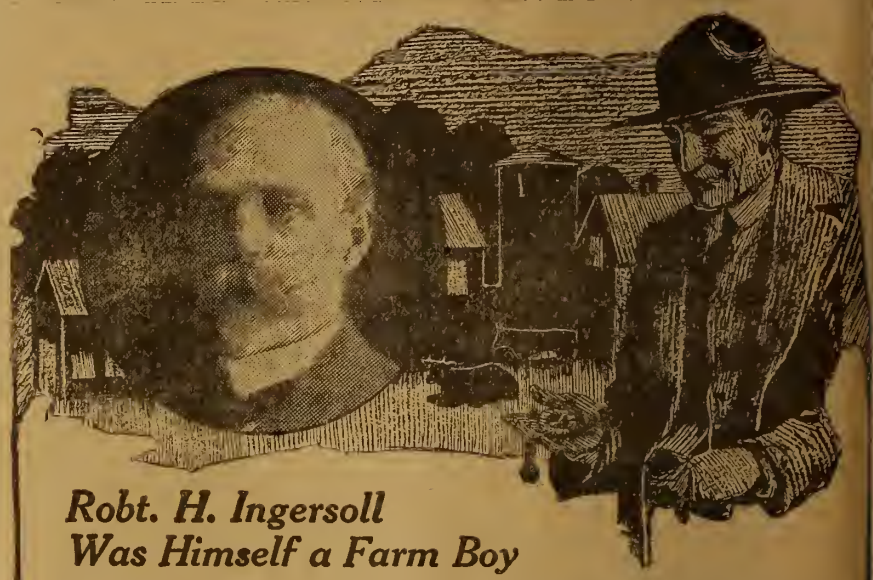
PROVING THE VALUE OF SUMMER PASTURE

A small field of summer pasture sown on the farm is very valuable in many ways. If the ordinary pastures are short and dried up during July and August, the piece sown to summer will tide the stock over the dry pasture period. If the ordinary pasture is good, then the summer mixture can



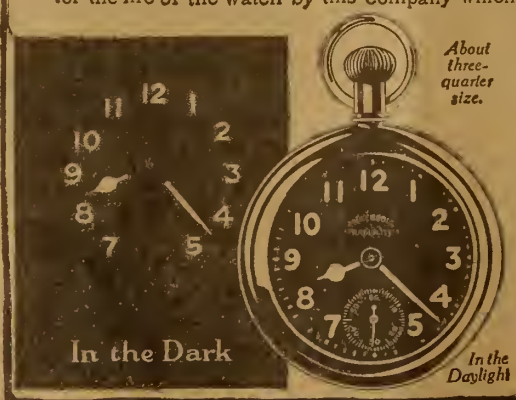
Robt. H. Ingersoll Was Himself a Farm Boy

THE inventor of the famous Ingersoll Watch was brought up on a farm. Many a night he did the chores and wondered what the time was. He hasn't forgotten that the farmer needs a reliable watch—one that will stand hard knocks and show the time around the barns in the dark just as well as in the fields by day.

Mr. Ingersoll has brought out a new watch. It is his greatest achievement. It shows the time in the dark as clear as day. Until you've carried this watch you can't imagine what a help and comfort it is. The

Ingersoll Radiolite

has real radium in the substance on the hands and figures which makes them glow in the dark like the filament in an electric bulb. And the glow is guaranteed for the life of the watch by this company which has made 50-million watches.



There is no Radiolite but an Ingersoll Radiolite.

$2.50 Radiolite
The regular Ingersoll with radium-luminous figures and hands.

Waterbury Radiolite $5.00
Jeweled, small, stylish, sturdy; the watch people want.

be cut for hay or allowed to ripen as a crop. It is an excellent crop with which to seed down, especially when pastured or cut early, and may be sown after the regular spring seeding is completed.

Summer pasture mixtures were sown on a number of farms last year with good results, in connection with the Illustration County work being conducted by the Commission of Conservation in Dundas county, Ontario. On one man's farm five acres were sown as follows: one acre to oats and vetches, one acre to oats and peas, and three acres to a mixture of wheat, oats and barley. This field enabled the farmer to save for hay another five acre field, which gave a yield of 10 tons. The summer pasture grew so well, that when ready for use, it was fenced across and only half of it pastured. The two and one-half acres, however, provided the main pasture for 12 cows during July and most of August, and caused ao increase of 35 pounds per day in milk yield, which held up for more than a month while other pastures were short. The other half of the field yielded six loads of mixed feed cut green and made into hay. The field was seeded to clover and timothy, and the onset of the winter found it in splendid conditoin with a good catch of grass and clover.

Best results on this farm were obtained from oats and vetches, with wheat, oats and barley next, and oats and peas last. Plan now to try it this year; it means more feed.—F.C.N.

BIG FARMER-S MEETING AT LEW' ISVILLE

There will be held at Lewisville, June 19, a United Agricultural Societies picnic opening at 2 o'clock in the afternoon. Societies will consider procuring feed, flour, fertilizer, etc. for next year. Speakers invited are: Hon. J. F. Tweeddale, Miniister of Agriculture, Mr. J. D. McKenna, Editor "Maritime Farmer." Mr. Reek, Sec'y for Agriculture, Mr. MacLeod, Supt. Agricultural Societies, and others. No member of any Agricultural Society can afford to Miss this.

R.M. BYNON, Convener.

MR. CARVELL PROMISES CONCESSION FOR FARMERS

The Maritime Farmers has received the following letter from A. D. McCain of Florenceville, N. B., who with Mr. M. L. Anderson, Sackville, represented New Brunswick at the Ottawa Conference in regard to exemption for farmer's sons. The letter which speaks for itself is published in full:

Florenceville, N. B., May 17, 1918.

The Editor of the Maritime Farmer,
Sussex, N. B.

Dear Sir:—

As one of the representatives who were chosen at the special meeting or convention held at Fredericton some weeks ago, to meet the Government at Ottawa in connection with Mr. M. L. Anderson of Sackville, I might say that we met with very good success and that the Minister, the Hon. F. B. Carvell, assured us that the farmer's sons would be given every consideration; also that legislation should be passed exempting the widow's only son, who was a bonifide farmer. He also told us that he would endeavor to have exemption granted to farmer's sons during seeding time ending June 1st. I might say that to-day I am in receipt of a telegram from the Hon. F. B. Carvell in which he states we can have the farmer's sons exempted until June 15th, which would give them a full month, or ample time to have the seeding done.

I think the farmers should be very grateful to our representative in granting this concession, as this will enable them to have seeding all complete. If any possible further exemption can be granted he will be only too glad to grant same.

I think it would be well to have this report published in your paper so that the people in general would know just what has been done.

Thanking you in advance for this favor, I remain,

Yours sincerely,
(Sgd) A. D. McCAIN.

THE POULTRY .HOUSE WITH BATH ROOM

The dust bath deserves a place in successful poultry management, but at least seven out of ten poultry keepers neglect it. I saw a dust bath arrangement in a farm recently which excelled anything of the kind I had ever seen. Each pen of hens was given access through a slide door to an outside dust pen six feet long and three feet wide, the sides of which were of boards. The slope of the top was about one and one-half feet, and each pen was equipped with two covers, lifting to the back, the first of hen-wire, the second of glass frames and water tight. Each dust pen was built opposite an inside pen partition, and thus did duty for two pen flocks, only one flock however, being given entrance at a time. The dust pens had a sunny exposure. The material in which the hens burrowed was road dust, collected in open seasons. The poultry-keeper expressed the utmost satisfaction with the plan.

"We cannot give the hens the range." the poultrykeeper said, "and we believe that the yards are worse than worthless because contaminated so quickly. We use the outside dust pens pretty much the whole year round, planning to have the glass cover down during the stormy or exceptionally cold weather. The sunshine which the hens are able to enjoy we think of real value, besides, the benefit from the intimate contact with dirt. The dust bath, of course, is a very practical way of combating parasites. We clean the dust pens readily from the outside, and find the introduction of fresh dust a task involving little labor."

A common way of providing the dust bath is to keep a shallow box full of dry dirt in each pen. Another practice is to dump dirt in a corner. Each of these methods is more or less inefficient and slighted because bothersome to handle right. The cost of an outside dust pen is pretty sure to be forgotten in the new convenience. Using both the wire and glass covers and the slide door, it iis possible to handle the pen to meet a variety of conditions.

THE MILKING MACHINE: AN APPRECIATION.

By Paul Wing.

Never has the need for labor saving machinery for every agricultural purpose been so acute as it is to-day. The necessity for increased exports of food stuffs of all kinds to our Allies and our Armies overseas alone would have taxed sorely the productive ability of Canadian agriculturists in normal times.

But times are not normal. Abnormal exports during the last year or two have reduced our supplies of food in storage to a point far beyond that ever reached in recent years.

Two calls have come simultaneously from the Government; one for increased production of food stuffs; the other for more men. If the men come from the agricultural sections—and many of them must come from these sections, where are the food stuffs to come from?

Patently the men who are left must be enabled to increase their efficiency through the use of labor saving machinery. This is particularly true on dairy farms where the task of milking the cows makes man power or its equivalent absolutely necessary.

The agricultural man power of Canada has been drained by the response of Canada's farm boys to the call of the Motherland and of humanity. Higher wages in munition factories and shipyards have enticed many farm laborers away from the country. The ever present "lure of the city" to the farm hand and the boy growing up on the farm has taken its usual toll.

Of the available farm hands that remain to be had, many are of the wandering, discontented type; few are experienced milkers; still fewer will accept employment on farms where hand milking is in force if employment on other farms can be had. There is nothing unnatural about this dislike for hand milking on the part of the hired man, for I venture to say that no reader of these lines milks cows by hand because he likes to. In our boyhood days we milked because we had to, there was no cure for it.

The independent hired man is another thorn-in-the-flesh of the dairyman. How many men have you hired and put up with simply because you could hire no better—men who felt no responsibility toward their farm duties; men who seemed to watch for every opportunity to "get into town"; men who were more skilled at shirking than at working. How many times would you summarily have discharged such men as these but for the fact that you knew that without them you would be unable to even half-do the chores.

The solution of the dairyman's difficulties is labor saving machinery—machinery that will make him sufficiently independent of hired labor so that he will not have to put up with the inefficient and unwilling worker. Admittedly, the most irksome work on the dairy farm is the milking of cows by hand. It is the work that takes more time and undivided attention per year than any other work. It must be done regularly and thoroughly or an immediate decrease in milk flow results. Therefore the most important labor saving machine for the farmer who keeps eight or more cows, is a competent milking machine.

Not only is the milking machine needed for the purpose of eliminating the dairyman's labor difficulty and enabling him to pick and choose his men, but it is needed for economic reasons as well. The wages of hired men and the cost of feed have increased to such an extent that every possible means must be employed to reduce the production cost of milk.

The Milking Machine

From innumerable sources come the reports of milking machine users, stating that the milking machine has made them independent of hired help. In the first place the dairyman with a milking machine can afford to discharge incompetent or refractory help. He need not worry about getting the milking done until he can hire more competent men, for the milking machine will enable him to do alone, or with the assistance of his son, daughter or wife, what four or five men have been required to do by hand.

However, the dairyman must not mislead himself by assuming that any milking machine will solve his difficulties. Different milking machines differ as widely as different cows. There are thoroughbred milking machines just as there are thorughbred cows, and there are "scrubs" and "wasters" in the milking machine field just as there are "scrubs" and "wasters" in many a daiary. Don't take chances on cheap or inferior milking machines. When you determine to place a milking machine in your dairy, buy the recognized standard—buy a milking machine that milks in the natural manner, not one that is simply a milk pump. I shall have more to say later regarding the different types of milking machines.

Then again the milking machine converts milking from heart-breaking drudgery into a pleasant chore. For this reason good men are easier to get. The dairy farm which is equipped with a milking machine has no disadvantages over the general farm on which no cows are kept.

In point of actual economy, the milking machine is undoubtedly the least expensive of all farm implements to buy and maintain, for in the first place the milking machine is used twice daily, every day in the year, while most other farm machinery equipment of any size must lie idle for months at a time—take the mowing machine, the reaper, the seeder, the cultivator or the threshing machine. These machines are used for only a limited number of days, once a year, and during the balance of the year they lie idle. But the expense of depreciation and interest on the investment piles up just the same. The milking machine, on the contrary, earns its own way every day. It is a good deal like the big league ball player who plays in every game—he comes to bat so often that his batting average is bound to be a pretty good one.

On the average farm where milking machines are in use, it will be found that t he machines have enabled one man to do the work of three hand milkers and sometimes four. And one man with a milking machnie will do the milking in from one-half to two-thirds of the length of time taken by two, three or four men to do the milking by hand. This means, of course, that the workers can stay in the fields much longer tha never before and still finish the milking earlier. The milking can be started much later in the omrninig and still be finished in time for the milk train.

The milking machine also perimts of quicker handling of the milk. For example: While a double unit milking machine is milking tw ocows, the operator can carry the milk from the two previous cows to the milk house and there can weigh and cool it before returning to strip the first two cows and move the machine from the second two cows to the third. This abolishes th enecessity of allowing the milk to stand around in the barn or milk house and accumulate dirt and germs. The advantage of quicker cool-

SHERWIN-WILLIAMS
PAINTS & VARNISHES

ing will substatially reduce the bacterial count.

The milking machine often increases milk flow. The reason for this is that its regular, uniform action has a soothing effect on the cow. It is a well known fact that even the most regular of hand milkers milk differently at different times. You see it is impossible even for the conscientious and experienced man to milk uniformly at all times. Then how much more likely is a milking macine to lack uniformity when careless and incompetent men must be employed.

On acocunt of this absolute uniformity and regularity of action, the use of the milking machine invariably lengthens the period of lactation. The effect of machine milking on the cow (which has already beeen dwelt on slightly) is to sooth and quiet her. It invariably makes nervous cows calmer and easier to handle. A great manp users of milking machines claim that they have saved diseased quarters. This, no doubt is due to the even, regular masage given to the teats between each two suprts of milk. This action is muc hlike that given by the sucking calf.

So-called "hard-milkers" hold no terrors for the milking machine. After the first two milkings they are converted into easy milkers, and frequently a cow that has built up a reputation as a boarder or waster, will develop into one o fthe best producers in the herd.

The prospective milking machine user need never have no fear of injuring his cows through the intelligent use of the milking machine, for milking machines are used on many of the highest class and most valuable pure bred record cows. Among other thoroughbred Canadian dairy farms on which milking machines are used are: Jos. Winter, London, Ont.; G. A. Brethin Norwood, Ont.; M. C. W. Kay, Sussex N. B.; L. A. Higins, Amherst, N. S.; G. E. Freeman, Amherst, N. S.; H. V. Dickson, Hammond River, N. B.

Milking machines are also used on the eight leading Dominion Experimental Farms. On two of these farms several types of milking machines have been used for about three years, and in view of the satisfactory service given by the machines on the Ottawa Farm and the Agassiz Farm, the Government recently placed its order with one of the leading manufacturers for six milking machine outfits for the other six farms mentioned.

Because they were introduced into that market first, milking machines have been in much wider use in the United States than in Canada up to the present, and many facts have been brought to light over there which are of unusaul interest to Canadian farmers and dairymen. These same facts have become self-evident to thousands of Canadians who have abandoned hand milking in favor of the milking machine. For that reason United States' experiences are worth stating in this article.

In the matter of cleanliness; obvious lythe effect of the competent milking machine will be to produce cleaner milk; I say "obviously" because it is certainly obvious that milk which does not come in contact with the stable air will be cleaner than milk which does. The experience of Mr. A. L. Grove, of Lewis Center, Ohio, demonstrates this fact. Mr. Grove attained something more than local fame by producing milk with the olwest bacterial coount of any shipped into Columbus, Ohio. The reward for the production of cleaner milk is better milk prices. The Walker-Gordon Farms, near Boston, sell their machine made milk for 25c. per quart, retail. They can never get enough to supply the demand. The Kelsey Ranch, at Lexington, Mass., sells its milk for the amazing figure of 40c. per quart. In no small measure their ability to procure this high price is due to the use of the milking machine and the production of absolutely clean milk.

Now you may that the savings and benefits from the milking machine, which I have mentioned, are largely problemical; that possibly a few dairymen can sell their milk for 25c. or 40c. per quart, but that no such market is open to you.

Posibly you are right, but even so the milking machine will be the greatest single factor in increasinig your dairy profits and in enabling you to survive, in spite of labor difficulties, high feed costs and every other difficulty to which the dairyman is subjected. For the milking machine will pay for itself in a remarkably short lnegth of time, without taking into considerationi any of the savings previously mentioned. Almost invariably it is posible to get along with one less hired man, and sometimes in moderate sized herds, it is posible to dispense with three or four hired men through the use of the milking machine. The savings of wages thus affected, even if only one man is dispensed with, will far more than pay for the best milker outfit in existence, in the course of a very few months. Superintendent John Livingstone, of Strathglass Farm, Port Chester, N. Y., told me himself that he has proven by actual records that milking by machine cost him approximately $130.00 per month less than milking by hand used to cost. At this rate he has saved the entire cost of his milking machine outfit nearly three times in one year.

The Right Milking Machine

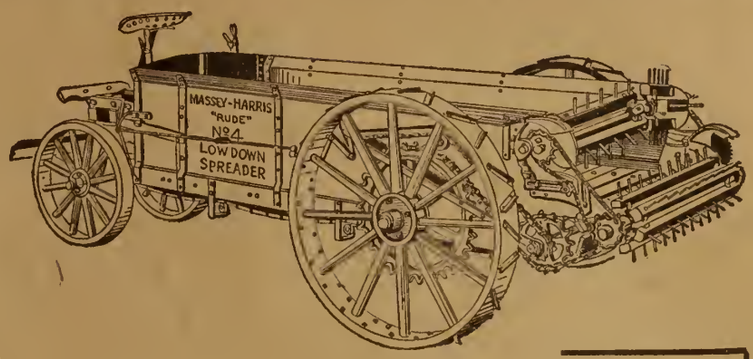
The prospective milking machine user must bear in mind that the present urgent need for labor saving machinery has brought out many makeshift milkinig machines.

Teh utmost care should be used in the selection of the milking machine, and only a machine should be purchased whic his a recognized standard.

When you investigate, get in touch

MASSEY-HARRIS SPREADER

Low Down Wide Spread



Here is a Spreader that is low-down, but not too low—plenty of clearance under the Frame.

It is a Wide-Spread Machine—spreading full seven feet wide, although the Box measures only 3½ feet.

Ample strength is secured by making the Frame of Steel—heavy 4-inch Channel Side Sills with Steel Cross Sills, forming the strongest Frame ever put on a Spreader.

The Simple Chain Drive does away with all Cogs, Clutches, and Springs, and when out of gear no parts of the machine are running to cause wear.

The Upper Beater is in two sections, set at an angle to spread the load out beyond the Wheels.

The Simple, Direct Drive—the Divided Beater and small size of same—the taper shape of the Bed—the Broad-Faced Wheels—the careful fitting of all parts—these combine to secure light draft.

For Illustrated Booklet, ask the Local Agent, or write nearest Branch stating where you saw this ad.

with the Government Experimnetal Farms' officials. You can certainly make no mistake in purchasing the machine which they are using on eight Experimental Farms, after having experimented with it on two farms ofr three years.

Be sure to buy from a manufacturer whose reputation is worth more to him thana few thousand dollars profit which he might be able to make by putting out a cheap and inferior milking machine to take advantage of the present urgent need of the dairyman.

THE PERIL OF CANADA

Hon. F. B. Carvell, in his speech to the House of Commons, on the need for swifter measures for enrolling men for the front suggested that very practical results might follow the sailing up the St. Lawrence of a German submarine. That was his way of reminding the province of Quebec that the reality of the fight to make the world safe for democracy only comes home to those who feel the teeth of the dogs of war. Not many of us have imaginations which can bridge the Atlantic. Even the wounded men who have come back to us do not carry to our minds complete conviction of the immensity of the struggle on which our future freedom depends.

We sometimes say that if Germany wins, Canada will be subjugated to Kaiser rule. Here and there the unthinking remark is heard that, under German rule, the worker could work no harder than he does now, and that government, even by an autocracy, such as they had in Germany before the war, would still be a more efficient government than the democracy that has developed on this continent, through the activity of Big Interests, and the indifference to their own concerns of the great majority of the people. Such talk is blind to the present facts, and careless of the future. Glance at a couple of the manifestations of the peace regime of military autocracy, outside such straight military affairs as the perpetual conscription of the youth of the nation for military service and the haughty and brutal superiority of the military caste.

When you arrived in a German city, before the war, you could not leave the railway station without giving an account of yourself to the ever-present policeman—whence you came and whither you would go. There was not quite the same system which distinguished the depotism of the Czar, across the Russian border; but to a citizen of a British country the restraint which he felt on entering a German city hung over him like a dark shadow out of which, at any time, he felt some sharp weapon of offence might fall.

There were seven million Socialist voters in Germany before the war. Liebnicht, their leader has long been in jail because he criticized the trickery of the Kaiser's men in provoking the war and dared to oppose the methods of barbarism which have characterized their conduct of the war. That, of course, was to have been expected in view of the sort of freedom of speech which the German citizen was permitted.

If you had attended a political meeting in Germany you would have noticed sitting on the platform a quiet-looking man, of a little different aspect from the working people and their friends who were come to hear their own affairs discussed. If a speaker criticized the Government strongly, or if the quiet-looking man interpreted what was said as likely to make the audience think too unkindly of their masters in Berlin, he would arise, lift up his hand for silence, and warn the speaker that if he persisted in that line of talk, the meeting would come to an end.

The speaker would be expected to explain himself; and most likely would modify his tone. But if, after further warning, he persisted in saying unpleasant things about the governing powers, the Kaiser's representative would rise once more, and declare the meeting closed. The audience would then disperse quietly, not daring to vent its resentment at the exercise of arbitrary authority.

Imagine that sort of thing in Canada. It is so long since the freedom of opinion was finally won in British countries that we have forgotten that liberty of speech has been bought at a great price. We have scarcely begun to recognize that it can only be preserved, at, perhaps a greater price. It took centuries of struggle against the exercise of just such authority as the German people accepted as a matter of course, to achieve our present freedom. The Stuarts asserted the divine right of kings—the very doctrine for whose revival throughout the world Europe has been deluged with blood, and against which forty thousand Canadian lives have already been laid down. We must not allow their sacrifice to result only in graves in Flanders and the death of freedom in Canada.

Even in the United States, Germans who had become Americans with the reservation of their German citizenship, have not scrupled to assert that one day the methods of their Fatherland would become supreme on this continent. The destruction of the ease with which we live among ourselves, each family untrammelled in workin out its own destiny, would be only one of the calamities which will follow a peace dictated by Germany at the mouth of a long-range gun. The more you follow out the ramifications of the German methods of domination, the more appalling they are.

. For liberty of utterance, which John Milton declared to be the greatest of all liberties, our fathers suffered much and for several generations. To save what they won, we must fight more, because, if we lose, the freedom wherewith we are free will perish from the earth for our time and, so far as can be seen, for the time of our children's children.

"SAFETY FIRST" IN THE HANDLING OF DANGEROUS BULL

The bull I have will be six years old the coming spring and would be just delighted if he could get a favorable chance to punch a hole in the person who handles him.

I take a piece of tough hardwood board nine or ten inches wide and 13 or 14 inches long (length and width proportionate to size of the face), and then atke two strips of thick board, an inch and a quarter or inch and a half thick, cut as long as the board is wide for cleats. Through each cleat about three-fourths of an inch from the end I put a rivet or small bolt through the wide way. I then tack the cleats to the board even with the ends, and bore a hole through the cleats and board just below the rivet, then nail the cleats securely to the board. About two inches from the opposite edge of the board I bore two holes, each hole an inch or inch and a half to one side of the centre. All holes are made large enough to admit a cattle tie chain or a heavy dog chain, the size commonly sold for 50 cents. I then

hold the board against the animal's head (having him securely fastened) so that his eyes come about the centre of the width of the board and get the measure of the length of chains necessary to pass through the holes in the cleats and over the horns, and then placing the chains, wire the ends together. I use another piece of chain on top of the head to hold the two just adjusted at the base of the horns, and another piece of chain to pass through the ring hole in the nose and up from the back side of the board through the holes near the lower edge and wire the ends together. Put the cleat side of the board next the face, it helps to make the blind more effective. Now you have a blind that will stay put. If the bull raises his head and projects his nose he can see all about him, but if he lowers his head to make a lunge at his caretaker his objective is hidden from him. I have had two or three vicious bulls, but not one of them ever undertook to attack me when the board war's on. I picket my bull around the buildings, daytimes, during the pasture season. I took a piece of 1¼ inch round iron one foot long to a machine shop and had a grove turned three-quarters of an inch wide and as deep as band iron is thick, and so that the top of the groove is one quarter of an inch from the end, and then had our country blacksmith point it, and put a collar and swivel on it. Fastened to this I had a 20-foot length of one quarter inch cable chain with a heavy swivel snap attached to the other end.

To set the picket pin I use a round iron bar that is a little larger than the picket pin, around which I cut a crease with cold chisel, that is the same distance from the end of bar as it is from the point of picket pin to the under side of the collar. When I settle the bar in the ground so that the crease is at the surface, it lets the pin into the ground so that the collar of the pin is at the surface, and the chain does not get wound around the head of of the pin, unless the grass is very tall. The pin is usually easily lifted out. As a part of the hitching apparatus, I have a piece of quarter-inch cable chain around the horns placed as follows: Put the chain around one horn, then slip the ends throuh a ring that is large enough to admit the picket chain to pass through also, then cross the ends and bring one end around the other horn and wire the ends together.

To hitch the bull pass the free end of picket chain up through the nose ring, and up between the board and nose chain, then through the ring on head chain, then down three or four inches and snap to a link. A bull hitched in this way will stay placed if the pin is not set in mud. The chain wears rather fast near the nose ring and it will be necessary to cut out a few links occasionally and reunite the chain

F. A. SNOW.

One of the most important meetings of sheep raising in Canada was held in Ottawa before the War Trade Board Wednesday, April 17th. It comprised a conference called by the War Trade Board of a Committee of Wool Growers appointed at the national convention of sheep raisers in Canada in February, with a committee of the manufacturers, wool dealers and wool pullers. The growers wer erepresented by Col. R. McEwen, London, Ont.; Capt. J. D. Wilson, Forres, Sask.; W. A. Dryden, Brooklin, Ont.; H. S. Allen, Lethbridge, Alta.; Stanley A. Logan, Amherst, N S.; and T. Reg. Arkell, Toronto, Ont. These growers are all members of the Canadian Co-operative Wool Growers, Limited, and Col. McEwen and Capt. J. D. Wilson are President and Vice-President respectively.

The manufacturers feared they may not have sufficient Australian and New Zealand wool allotted to them by the British Government to serve their purposes and consequently might require American and Canadian wool to meet their needs. At present American wool canot be exported to Canada except for the purpose of manufacture of American Government orders and they claim Canadian wool was most frequently shipped out of the country either on consignment or direct sales, without themselves being given an opportunity to bid upon it.

The Growers were eager to assist the manufacturers in any reasonable fashion that at the same time would insure Canadian wool being sold at a price equal to the American market for this product, and drew their attention strongly to the liklihood of an exodus of sheep from Canada to the United States should Canadian prices fall below the level of those in that country. They, therefore, pressed the desirability of an unrestricted market for Canadian wool and the advantages which would accrue to the Canadian sheepraiser if Canadian wool went into the United States without the present restrictions imposed by the latter country, whereby the Government exercises an option upon all imported wool at July 30th, 1917 prices less 5%. At the same time they were willing to present their wool to the Canadian manufacturer before export, for his purchase at the export price should he desire it.

The result of the conference is expressed in the following rsolution:

"That the Canadian War Trade Board request that the U. S. War Trade Board continue to allow the fre export of Canadian grown wools both fleece and pulled to the U. S. A. on the basis that grading is permitted in the same without exercising government import options and further to encourage the import of foreign free wools that the Canadian Government remove the emabrgo at present in effect which prohibits the re-export from Canada to the U. S. A. of foreign free wool now held or in future imported into Canada, the export of this to be under licence.

Hay-making a Pleasure

FROST & WOOD "CHAMPION" SIDE DELIVERY RAKE

Cleans up a wide swath and gives you a nice, even, loosely-piled windrow, through which the air can circulate and give you perfectly cured hay. The three tooth bars, arranged on a cylinder, give a perfect clean-up. No work about it —all you do is drive. This Rake is made of the highest grade materials, rigidly braced, and will handle the heaviest crop.

Frost & Wood Haymaking Implements are big labor savers and big crop sellers. You know your hay crop is the easiest spoiled of any if it isn't harvested right. Must be cut when ready. Must be properly cured. Must be got in on time. All these are easy, pleasant jobs if you use implements we have designed for the work —Frost & Wood Mowers, Rakes, Side Delivery Rakes, Tedders, and Hay Loaders.

FROST & WOOD "TIGER" AUTOMATIC DUMP RAKE

IT PAYS—THE F. & W. IS ALWAYS READY

Because a Rake looks a simple machine to make don't put up with cheap, inferior workmanship—get a Frost & Wood and save real money. Teeth of special quality, tempered steel, and arranged securely in the tooth bars. It is self-dumping, discharging the load automatically with only light pressure on the convenient foot lever. Made of steel, amply strong, clean working, the F. & W. Rake give a long lifetime of hard, faithful service.

Let us send you our new Haymaking Folder —very interesting. At our nearest agents, or write our nearest Branch today.

ARSENATE OF LIME

During the last few years the Entomological Branch has been devoting increased attention to the study of insecticides, with special reference to the possibility of securing cheaper materials. One of the first results of this study consisted in a demonstration of the value of arsenate or lime or calcium arsenate as an insecticide. On account of the low cost as compared with the cost of other widely used insecticides, its use is recognized for many purposes at the present time. Its value has also been recognized for the same reason in the United States.

At the present time arsenate of lime which should be clearly distinguished from arsenite of lime, is only recommended as a spray for apple, potato and pera; it is not regarded as a safe insecticide for trees having tender foilage such as plum, cherry or peach. Nor do we recommend the use of arsenate of lime alone, but only in conjunction with lime, Bordeaux mixture, or sulphide sprays as described later. During the years 1915, 1916 and 1917 it has been used in Nova Scotia both commercially and experimentally in a variety of ways. Although the results from its use have not been uniformally satisfactory, this could not be expected on account of the lack of knowledge concerning the material. Nevertheless the satisfaction following its use has been such that orders for arsenate of lime in Nova Scotia in 1918 have exceeded those of all previous years combined; in fact, the orders for arsenate of lime in the Annapolis Valley exceed those for all other arsenical insecticides combined.

In discussing this poison it must be understood that unless otherwie stated we refer to the commercial dry material containing 40 per cent arsenic oxide in the form of tri-calcium arsenate and less than 1 per cent soluble arsenic, and so powdered that one pound of the dry material occupies eighty cubic inches. Although originally intended for use with Bordeaux mixture it was soon found, after the material had been introduced, to be the only poison that could be used safely with sulphide sprays, that is without being responsible for unsatisfactory results such as injury to foliage or the formation of undesirable chemical combinations.

The Action of Arsenate of Lime on Foliage When Used Alone

Many growers and investigators have used arsenate of lime alone, usually with disastrous results. The properties of this material are such that, when it is used alone, it causes a yellowing and often a burning of the foliage. The yellowing is generally caused by the formation of soluble arsenical compounds, and burning results from either an excessive use of the insecticide or certain weather conditions which abnormally hasten the breaking up of the material and the liberation of soluble arsenical compounds. Injury from the use of arsenate of lead alone is usually slight at first, increasing with each successive day for a week or more. The use of arsenate of lime alone on foliage is not recommended, although it has been used in some cases successfully on potatoes.

Used in conjunction with lime no damage such as burning of the foliage need he apprehended.

The Use of Arsenate of Lime with Lime

It has been found tnat where ten parts of either water-slaked or hydrat-d lime is used to one part of arsenate of lime, the material can be applied to apple and potato foliage without injury.

Arsenate of Lime Compared with Arsenate of Lead when used with Lime-Sulphur

The following comparisons of arsenate of lime and arsenate of lead with lime-sulphur may be drawn from three years experience with arsenate of lime in Nova Scotia: Arsenate of lime with lime-sulphur has nivariably given slightly better results in the control of fungous diseases than arsenate of lead with lime-sulphur. This is very possibly due to the fact that upwards of 35 per cent of the sulphur may be precipitated in the latter composition. Arsenate of lime with lime-sulphur has, in all experiments in Nova Scotia, caused less leaf-burning or singeing than the arsenate of lead with lime-sulphur spray. This is on account of the larger quantity of soluble arsenic in the latter combination.

Arsenate of lime with lime-sulphur has caused noticeable yellowing of the leaves more often than the arsenate of lead with lime-sulphur combination. The underlying causes of the yellowing of the leaves would appear to vary and they are now being investigated. It may be noted, however, that only here and there an isolated grower reported yellowing from the third spray (that applied immediately after the blossoms), while possibly 5 per cent of those who used lime-sulphur with arsenate of lime for the

ECONOMY
applied with a
Paint Brush

The great national duty today is to "conserve." It's a duty you owe yourself as well as your country. A duty just as applicable to a house, barn, farm implement, or wagon, as it is to the things you eat and wear. Buildings, in fact, show so tremendous an increase in cost, that the importance of *keeping them protected* is apparent to all who know how steel, wood, brick and cement have jumped in price. And the cheapest protection you can give a building is the kind you apply with a brush—PAINT. For true protection, scorn the ineffectual, cheap paints. Use only

B-H "ENGLISH" PAINT

70% Pure White Lead (Brandram's Genuine B.B.)
30% Pure White Zinc
100% Pure Paint

the kind we guarantee to possess as its important basis the above correct formula.

That formula, printed on every can, and guaranteed over our President's signature, commits us to this standard. High in cost as white lead has become, we *must* use it in the same proportion as heretofore. To use less of it, would necessitate the removal of the guarantee from our cans—and to do that would injure the reputation that these paints have acquired by reason of their superior ingredients. It is by using pure white lead and pure white zinc in such liberal quantities that we have been able to produce a paint that truly excels in covering capacity—and that stands the severe "climate test" of Canada in a way that spells true economy for all who use it.

Other B-H Products of Sterling Worth

For Interior Varnishing

The name "China-Lac" suggests a china-like finish—and that is just the kind of finish you get from the use of China-Lac—the perfect varnish stain. Being transparent, it preserves the "grain-beauty" of the natural wood—at the same time giving splendid color effects. Easy to apply—not affected by either hot or cold water.

For Staining the Roof

Our "Anchor" Brand Shingle Stains are especially prepared to preserve wood from decay. Easy to apply—on rough surfaces they give a better effect than paint. Shingles may be dipped or brushed on. Come in 19 different colors.

For Plaster Ceilings and Walls

Use Fresconette—a flat tone oil paint. Fresconette comes in a variety of shades. It is absolutely sanitary, for it may be cleaned with a damp cloth or thoroughly washed at will.

For Varnishing a Floor

Our "FLOORLUSTRE" finishes a floor with a lustrous coating of the most durable enamel. Will stand hardest wear—will not show scratches. Excellent for interior floors. For Porch Floors, Ceilings, Posts, etc., where surface is exposed to the weather, use B-H Porch Floor Paints.

Imperial Barn Paint affords a convenient protection for barn and outbuildings, made of good material, covers well, dries hard, goes furthest and lasts longest.

BRANDRAM-HENDERSON LIMITED

MONTREAL HALIFAX ST JOHN TORONTO WINNIPEG CALGARY EDMONTON VANCOUVER

fourth spray (the spray applied two weeks after the blossoms) reported yellowing..

The type of yellowing that is due to arsenical injury can be easily eliminated by adding either five pounds of water-slaked or hydrated lime to each 40 gallons of the lime-sulphur with arsenate of lime combination when used for the sprays after the blossoms. So far as our observations go, the addition of lime to the third spray (the spray immediately after the blossoms) is only necessary in orchards where the trees are subject to yellowing on account of the variety of apple or the treatment of the orchard. Lime sulphur is not advocated by us for the spray two weeks after the blossoms, but where it is used as a fungicide to add five pounds of water-slaked or hydrated lime to prevent the liberation of soluble arsenic and the yellowing of the leaves.

The trees sprayed with the arsenate of lime with lime-sulphur combination have in all the experiments carried on by us for three years given more apples than those sprayed with the lime-sulphur and arsenate of lead combination.

In poisoning value arsenic in the form of arsenate of lime (with lime sulphur) is fully equivalent to an equal quantity of arsenic in the form of arsenate of lead.

The arsenate of lime with lime-sulphur combination is much more easily and thoroughly agitated than the arsenate of lead with lime sulphur combination on account of its physical properties and freedom from lead sulphide or "sludge."

Arsenate of lime in its convenient form may be more easily and occurately weighed and added to the spray, and it may also be stored more safely than paste arsenate of lead.

Arsenic in the form of arsenate of lime is less than 60 per cent of the price of arsenate of lead in the paste form according to the prices in Nova Scotia in 1918.

The Use of Arsenate of Lime With Sulphide Sprays.

Arsenate of lime is the only poison on the market that can be used with sulphide sprays, such as lime sulphur, barium tetra-sulphide and sodium sulphides, such as "Soluble Sulphur" and "Sulfocide," without such chemical change taking place between the sulphide and the poison as would result in injury to foliage. When acid (hydrogen) or standard lead arsenate is added to lime-sulphur a certain amount of double decomposition occurs resulting in the formation of lead sulphide and crude arsenate of lime, five per cent of which is soluble arsenic. This reaction may precipitate as much as 35 per cent of the sulphur from the solution as lead sulphide, the black "sludge" with which the orchardist is familiar. Arsenate of lime, on the other hand, does not cause any perceptible decomposition or change in the sulphide composition and the standard brands contain much less than one per cent of soluble arsenic. The presence of lime sulphur in the spray prevents the formation of soluble arsenic compounds from arsenate of lime.

With sodium sulphide solutions, such as "Soluble Sulphur" and "Sulfocide," arsenate of lime is the only commercial poison trat can be used without damage to foliage resulting from the formtion of soluble arsenical compounds.

On account of the apparent increase in the toxic value of arsenicals that results from the presence of sodium salts, it has been found desirable to decrease the amount of arsenate of lime used with sulphide sprays to the proportion of one-half pound of arsenate of lime to forty gallons. It has been found that the sodium sulphide solutions do not adequately protect the arsenate of lime against air and that in order to eliminate yellowing where the sodium sulphide with arsenate of lime combination is used for the four sprays, 10 pounds of hydrated or water-slaked lime must be added to each 40 gallons, although it may be tically eliminated by using five pounds of lime to each 40 gallons in an orchard that was not well-cared for.

The Use of Arsenate of Lime with Bordeaux Mixture

Arsenate of lime has given the best of satisfaction and no leaf injury when used as a spray for the apple in conjunction with Bordeaux mixture made according to the various formulae. It would appear that on account of its adhesive qualities arsenate of lead assists the fungicidal action of Bordeaux mixture more than arsenate of lime. On the other hand, the difference in cost and greater convenience are both in favour of arsenate of lime.

Formulae for use of Arsenate of Lime

As a potato spray:—

Arsenate of lime: 1½ pounds.
Bordeaux mixture: 40 gallons.

As an apply spray; The following proportions are practically equivalent on account of the effect of the fungicides on the action of the poisons:—

With Bordeaux mixture: 1 pound of arsenate of lime to 40 gallons.

With lime sulphur: ¾ pound of arsenate of lime to 40 gallons, adding 5 pounds of hydrated or water-slaked lime to the two sprays applied after the blossoms.

With "Soluble Sulphur" and Sulfocide": ½ pound of arsenate of lime to 40 gallons, adding 10 pounds of hydrated or water-slaked lime to each spray.

Cost of Arsenate of Lime Compared With Other Poisons.

When the cost of arsenic is taken in to consideration arsenate of soda is the only arsenical insecticide that approaches in any degree arsenate of lime in cost as a potato poison.. Paris green and arsenate of lead are at the present time costing about two-thirds more than arsenate of lime while arsenite of zinc is costing about one-third more.

Arsenate of lime when it is to be used with Bordeaux mixture may be manufactured at home by dissolving nine-tenths of a pound of arsenate of soda (65 per cent arsenic oxide) in water and using all the solution, which would be about two quarts, to slake enough lime for forty gallons of Bordeaux mixture. Whether this material has any advantages over that made by adding the arsenate of soda solution to the completed Bordeaux mixture is questionable.

The home manufacture of arsenate of lime for use with sulphide sprays is not advised at the present time as the difference in cost between the home and factory made material is usually slight and is not always in favour of the home-made.

A first-class arsenate of lime is rather a hard material to make, even in a well equipped laboratory or factory, as is shown by the fact that there are now on the market some brands of arsenate of lime that are very low in arsenic, are coarse and gritty and in which the percentage of soluble arsenic is too high for safety when used with sulphide sprays. These materials are being sold for only a few cents less than well-manufactured articles containing twice the amount of arsenic. It is feared that all makes of arsenate of lime will suffer from the trouble that must follow the use of this material when combined with other sprays than Bordeaux mixture.

Buyers, in order to protect themselves, can ask a guarantee of less than one per cent of water soluble arsenic in addition to a guarartee of the arsenic content and the form of the arsenic content, which should be tri-calcium arsenate. Also, if they desire a guarantee of fineness, they may stipulate that one pound of arsenate of lime shall occupy not less than 70 to 90 cubic inches of space. We would advise buyers to be most careful in ordering arsenats of lime for use with sulphide solutions. And again we would impress upon growers the fact that it is important to distinguish between arsenate of lime or calcium arsenate, to which material this circular refers, and arsenite of lime or calcium arsenite which is a different material requiring further investigation.

Observe the condition of the low-lying parts of the farm; if water stands here and there, plan to get it off. To begin with, open up water-furrows and surface drains. Plan to do some tile draining if you can.

McLAUGHLIN MOTOR CARS — VALVE-IN-HEAD

War Service is Demonstrating McLaughlin Efficiency

FOR real service under adverse conditions the McLaughlin has won an enviable reputation.

This reputation is the result of a continuous effort to make better cars.

The McLaughlin Carriage Co., Limited.
OSHAWA, ONT., CANADA

Gentlemen:

I arrived in France, April, 1917, with one of your cars (Model D45 Touring). Up to now it has covered over 18,000 miles over all conditions of roads, some so bad one would never think of taking a car in private use.

It is only fair to you and your car that I should tell you that up to now it has given no trouble nor has it had any replacements except one plug and the carbon removed. The oil we are getting not always the best.

This statement is correct and will bear any investigation. Have had such pleasure with the car, compared with others, suggested it to me that I should write you this note, which may be of some use.

Yours sincerely,
CHAS. P. BAILEY,
a/c. Corporal.

This letter and photograph is a copy made from the original sent from somewhere behind the lines.

MONTREAL

Country Produce

Conditions in the eastern markets for eggs of late have been sowewhat perplexing. Several of the large operators reported that they had decided not to put eggs in the coolers above a cost of 36c. f.o.b. country points, and a number of dealers claimed this was having a bearing on prices in the country. Montreal dealers in some cases have also decided not to pay over 35c to storekeepers and 36c to gatherers f.o.b. cases returnable for this week's shipments. There was no important change in the condition of the local market, prices being maintained with a steady trade passing in a wholesale jobbing way, and the market on the whole was fairly active. The receipts today were 2,532 cases, as compared with 2,872 for the same day last week, and 3,635 for the corresponding date a year ago.

We quote wholesale jobbing prices as follows:

Selected Stocks.....44c to 45c
No. 1 stock.....00 to 42c
No. 2 stock.....38c to 39c

The feature of the past week in the poultry market was the large increase in receipts of hens, and as a result of these prices in some of the western markets declined 2c per lb. A few more old roosters have been arriving, but otherwise there is no important change in the situation. Frozen poultry continues to move into consumption freely at full prices. Reports to hand point to an early start having been made this spring in breeding operations, and while the number of chicks hatched may not come up to former years, prospects are bright for earlier laying next fall and winter. Reports on fertility are good for Ontario and the West, and in British Columbia the chicks are reported to be thriving on a smaller grain and heavier clover ration. Earlier and better chicks seem to be the farmers' objective this year.

There were no new developments in the condition of the market for maple product today. The feeling remains very firm with a steady demand for supplies, of which the offerings are small on spot, and buyers in some cases find it difficult to fill their requirements, and especially so of small packages. A few lots of maple syrup in 15 to 20-gallon barrels are offering and selling at $1.80 per gallon, five gallon tins at $1.85 per gallon, while one gallon tins are scarce at $2 to$2.10 and 8½ lb. tins at $1.50. The tone of the market for maple sugar is also firm with a fair trade passing in a wholesale jobbing way at 22c to 23c per lb.

The market for potatoes was without any new feature to note today, prices being very firm with a continued good enquiry for car lots from outside sources, of which the offerings were somewhat limited, and in consequence of the volume of business was checked to some extent. Sales of car lots of Green Mountains were made at $1.55 to $1.60 per bag of 90 lbs. in bulk, reds at $1.45 to $1.50 including bags, and McIntyres at $1.35 to $1.40 ex track, while in a wholesale jobbing way Green Mountains sold at $1.80, reds at $1.70, and McIntyres at $1.60 per bag of 90 lbs. ex store.

The Local Flour Market

There was no change in the condition of the market for white flour, or its substitutes today, prices for all lines being steady with a fair trade passing for local and country account in small lots and the market in this respect was moderately active with sales of rye flour at $16.50 per barrel in bags; barley flour at $13.50; corn flour at $12; graham flour at 11.20 and rice flour at $9 per 100 lbs. put up in sacks of 220 lbs. The trade in spring wheat flour was quiet and prices were unchanged with car lots of Government standard grade for shipment to country points quoted at $10.95 per barrel in bags, f. o. b., cars, Montreal, and to city bakers at $11.05 per barrel delivered. The tone of the market for winter wheat flour remains firm but the demands for supplies is limited, and business is dull with broken lots quoted at $11.40 to $11.50 per barrel, in new cotton bags, and at $1.20 in second hand jute ex-store.

Mill Feed and Oats

A feature of the millfeed market has been the weaker feeling in pure grain moullie, and prices have declined at $3 per ton, with sales of broken lots at $73 per ton, including bags. The tone of the market for other lines of feed has ruled steady, and prices are unchanaged with a fair amount of business passing, and sales of bran were made at $35 and shorts at $40 per ton, including bags. There were no new developments in the market for rolled oats, prices being steady, but the demand is still somewhat limited and trade is quiet with sales of standard grades in broken lots at $5.15 to $5.30 per bag in jute, and car lots were quoted at $4.85 to $5. A steady trade continues to be done in cornmeal, and prices were unchanged with sales of Golden grade at $6.25 to $6.40 per bag, and bolted at $4.50 to $4.75, delivered to the trade.

ditoins are such that hens or pullets cannot be induced to lay until the warm rays of the spring sun take the cold, clammy dampness out of the atmosphere. The pen may be well constructed from a contractor's viewpoint. A good foundation, double boarded and papered walls, with windows and doors well fitted may keep out the wind. A ventilator in the roof may be installed with good intentions, but yet the pen is damp and birds may refuse to lay. They mope around during the day, and colds, roup and other diseases are common.

It is not necessary that the pen be particularly warm if it is dry and free from drafts. However, unless there is sufficient ventilation the moisture from the breath of the birds condenses on the walls and gives a clammy feelin the hen-house. It may be possible to slightly change the construction of the present house so that conditions will more nearly conform with what is esential in a winter laying pen.

A poultry house which gives good results is built of one thickness of boards with cracks battened, except on the north side where it is advisable to use two thicknesses of lumber and one of paper. The front can be low and open, with a window facing south west or west. If the walls are six or seven feet high, one-third of the side facing south should contain glass, and one-thord cotton. This gives light and ventilation without a draft. Even when a gale is blowing no wind is felt inside the cotton. The air diffuses through and keeps the pen fresh. In a pen of this nature very little moisture will be seen ono the walls or roof during the coldest weather. The air is dry and the birds do not suffer as much as those in a warmer but damp pen.

It will only take a few hours' work to remodel some of the present henhouses to make them more nearly meet the requirements of the hen. Concrete examples will illustrate how a few changes are sometimes necessary to make the pen healthier for the bird to live in. One pen that was built in three compartments, each large enough to accommodate about forty hens, had considerable moisture on both the walls and the roof during the first winter. When building, the owner thought he was constructing a model hen house. It was double boarded on the north and had a shanty roof which gave plenty of space for the window in the south side. All through the winter the rays of the sun streamed into the pen, but it failed to rouse the birds into activity. They appeared mopy. The straw on the floor could not be kept dry, and the walls were drippngi with moisture at every mild spell. The birds were bred right, and were particularly well fed on a wide variety of feeds, but they failed to lay when eggs were high in price. The following winter there was the same trouble, until the begnining of January, when it was suggested that there was not sufficient ventilation in the pen. True, there were ventilators in the roof, but they did not seem to meet the requirements. It was advised that several of the large windows be removed and the openings covered with cotton. The objection was then raised that the pen would be too cold for the birds, as it was necessary that they be kept warm if they were expected to lay. However, he finally yielded to make the suggested alterations, and to close the openings in the roof which was allowing what warm air there was to escape. The weather set in particularly cold after the cotton front was put in, but the birds did not see mto mind it nearly so much as the previous cold spell when their house was tightly closed. No dampness appeared on the walls; the straw on the floor began to dry and the birds appeared to take a new lease of life. In fact, in less than two weeks after the change was made several had commenced layin. That was two years ago, and that poultryman has secured a fair percentage of eggs, when prices were high, since he remodeled his pen. Another instance comes to mind of a well-built, little poultry pen of sufficient size to accommodate from sixty to seventy birds. It was about half as wide as it was long, with the long side facing south. This was filled with windows, and really the pen looked ideal the fall it was built. However, no eggs were gathered that winter, nor the next, until warm weather. The owner was lamenting the fact that he had put so much money into his poultry house, when the suggestion was made that he substitute cotton for part of the glass and fill the gable of the pen with straw. This was done, and returns have been satisfactory ever since. On one farm the poultry was kept in a pen at one end of the stable. It was so constructed that very little light was available, but it had the advantage of always being warm. While the flock usually laid a few eggs during the winter, better results have been obtained since the birds were partitioned off by themselves and a large opening made in the wall for glass and cotton. Poultry will not stand dampness, but it is almost impossible to avoid it unless ventilation is given. It does not seem that this can be obtained satisfactorily through a ventilator in the roof; the curtain-front is a much more satisfactory means. It is not expensive and is easily put on. True, it collects dust, which has a tendency to clog the pores of the cotton and so keep out the air, but this can be remedied by occasionally cleaning the cotton. If your poultry house is damp and the cotton-front has not been tried as a remedy, it might pay to try it this winter.

A large orchard is seldom profitable on a large farm because it requires more care and attention than the farmers are willing to give it to make it really pay. The home orchard therefore should not be more than an acre or so of trees, just enough that the owner will prune, spray and look after the trees as he should. To make a large orchard really worth while requires a man well versed in horticulture and who can put his entire time and energy to the care of it. It is certainly not advisable to plant trees and then neglect them for they not only fail to give adequate returns, but they may become a menace to the other orchards of the neiighborhood as breeders of insects and diseases.

PREVENT WHITE GRUB INJURY

White Grubs, which are the larvae of the well known May Beetles, or June bugs, will, it is expected, cause serious injuries in the province of Ontario, and possibly in other sections of Eastern Canada in 1918. This statement is based on our knowledge of the life-histories of these insects. The grubs feed naturally on the roots of grasses, so when sod land is ploughed up they are deprived of their usual food and readily attack such crops as corn, potatoes, strawberies, etc., if grown on the land. The ijurious species require three years to complete their life-cycles; in other words, a period of three years elapses from the time the eggs are laid until the grubs which hatch from the same are mature transform to the pupal state and appear as beetles. In 1917, the beetles were very abundant in certain districts in Eastern Canada, and eggs were deposited freely. The grubs hatching from these eggs did not develop much during the past year, but in 1918 the will grow more quickly and, being more voracious, will undoubtedly cause serious injury to the roots, etc., of various kinds of field crops. They will continue to feed throughout the growing season, and in the autumn of 1918 go deeper into the soil to pass the winter. In the spring of 1919 they will again come near to the surface, feed for a short period and then rest for a time preparatory to changing to the pupal state. It will be seen, therefore, that the second year in the life of the grub is the destructive one.

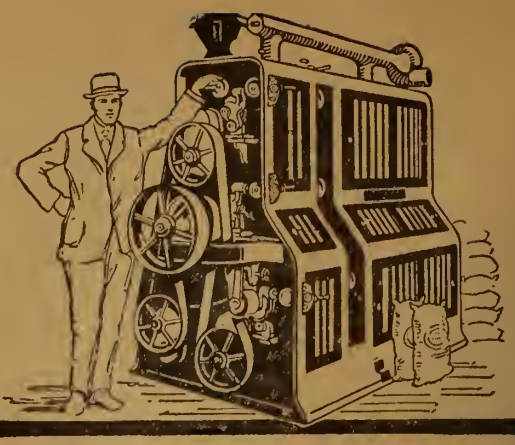
Methods to Prevent Serious Injury

Crops for infested land.—The female beetles lay their eggs in sod land, and also in land bearing such crops as timothy and the small grains. Suitable land nearset to groves or woods is favored by the beetles, which feed upon the foilage of the trees and then visit nearby fields to lay their eggs. In districts where the beetles were abundant in 1917, it is to be expected that such land is now more or less infested with the grubs, and it would therefore be unsafe in 1918 to plant on newly broken sod land, or on land grown to the above crops in 1917, any crop which would be attractive to the grubs. Crops particularly favored by white grubs are potatoes, corn and strawberries. In adition to these, other crops which are grown in wide rows, and timothy, are liable to injury. The safest crops to grow on land which is suspected of harboring grubs, are alfalfe, clover, or buckwheat. If it is not desirable to use infested land for alfalfa(clover, or buckwheat, the same may be again planted to timothy or small grains. Such crops as corn or potatoes should not be planted in 1918, on newly broken sod land in districts where the beetles were abundant in 1917. Corn or potatoes grown on land which grew the same crops in 1917, and which were kept cultivated and comparatively free of weeds during the flight of the beetles in May and June, 1917, will be reasonably safe from injury by white grubs in 1918.

Cultural and other Methods.—Under garden conditions, grubs are often turned up when the land is being dug or ploughed. As many of these as is possible should be removed by hand and destroyed. Under acre conditions there are unfortunately no practical measures known to destroy the grubs when they are known to be present in the land, and destroying crops. Late summer ploughing which brings many grubs to the surface, crushing numbers of them and exposing others to adverse weather conditions, is useful particuarly in years when grubs are changing to beetles.

Land known to be seriously infested and required for cropping in 1918 may be ploughed in late spring, thoroughly harrowed and planted to a late crop. Such late cultivation will attract to the fields, crows, blackbirds and other birds, which are known to feed readily upon these grubs, particularyl during their nesting period. Domestic fowls, such as chickens and turkeys, are also fond of white grubs and should be allowed the run of infested fields when these are being ploughed.

Limited areas may be practically freed of white grubs by turning in hogs, either in spring after the first of May, by which time the grubs will have come near to the surface, or in late summer when the crop has been removed. These animals are very fond of white grubs, and will root them out and devour them. An intestinal worm of hogs, called the giant thorn-headed worm, is known to pass one stage of its life-history within white grubs. The worm is introduced into the hogs when the latter devours the white grub. There is little danger of this happening, of course, if the hogs are allowed the run of the fields in which no such animals had been pastured within three years, as any worm infested grub in the land during such period will have matured and disappeared.



Grasp this Opportunity

Establish yourself in the milling business. Your country needs more flour. Thousands of new acres of wheat assure increased production. The local mill is coming back into its own.

Become the miller in your town. Operate a

Marvel

The Self Contained, Quick Process

Flour Mill

This simply constructed mill is your means of helping your country to take care of the increased wheat supply, of making better war flour at the lowest cost—and returning big profits to you. ***A Marvel Mill makes a better barrel of flour cheaper.*** It mills any grade or any grain and conforms to all government regulations.

Made in two sizes — 25 and 50 barrel capacities. No experience — no expensive buildings needed.

If you have as little as $3000 to invest you should get all the facts of this proposition at once.

ACTIONS SPEAK LOUDER THAN WORDS

It is time to stop talking about speeding up the farm and get busy doing it. Immediate action for increased production of food is urgent. The farmers on the farms are carrying on the agriculture of this county. The farmers of each community know their local conditions and are the best judges as to what forces and equipment will be necessary to meet government requirements. By organizing and mobilizing their forces and working together to carry out a reasonable farming program, adapted to their section, they can accomplish wonderful results. The purpose of the government and the province should be to co-operate with the farmers and back up their honest efforts by supplying necessary labor, capital and equipment, to insure the successful carrying out of the farming program adopted and ordered by the farmers themselves.

The only way to get increased crops is to plow and plant, and fight the weeds and other things also. Too much dependence is being placed in patriotism and exhortation and scolding.

The farmers are responding to the patriotic appeal as far as they can with family labor, but in order to hold hired labor they must be able to pay wages that will compete with the factories. The average farmer cannot sell crops grown with hired labor for less than they cost, because they have no capital to lose.

If the new meadows are thin, sow some clover and timothy when the frost is honey-combing the surface of the ground. Keep the cattle off; there isn't anything there for them to eat, and they punch the ground full of holes.

FARMERS AND BREEDERS

Who wish to keep their horses and cattle strong and healthy, should always have on hand a supply of

OMAZON

The Canadian medicinal stock food for Horses, Cattle, Sheep, Hogs and Poultry.

It will help to economize on feed and owing to its sovereign tonic and curative virtues will keep the stock strong, healthy and free from many ailments.

Order from your dealer. If he hasn't it in hand, he will be pleased to obtain it for you.

Maple Green Farm Holsteins

Just now we are offering some fresh calv d cows and some due to freshen shortly, also yearling heifers and heifer calves, all with official records or from official record dams. Remember this is the only herd in Eastern Canada which owns two Jr. 3 year olds with official records of 25.05 and 26.54 lbs. butter in 7 days.
Herd sires in service. "Maple Grove Mercena Mercedes," No. 11727, the sire of our 26.54 lb. Jr. 3 year old and who so far has not a tested daughter testing under 4%. Our Jr. herd sire, "Homestead Hengerweld Rooker," No. 20652, three-quarter brother to our 25.05 lb. Jr 3 year old.
For particulars write

R. L. HICKS
Dalhousie Jct., - - N. B.

ROSEWARNE
S.C. White Leghorns

I am now booking orders for baby chicks and hatching eggs from my well known bred-to-lay strain. Chicks will be very scarce this spring, and there will be a wild scramble later on for supplies, so get your order in early and pick your date.

My cockerels and pullets, out of same matings as day-old chicks were sold from last season, swept the board at Halifax.

Send for prices and mating list.

ERNEST CRAZE
Port Williams, - - N. S.

GLENRANE STOCK FARM

We are offering some very fine pure bred registered calves from 2 weeks to 8 months old These calves are sired by "Homestead Hengerweld Rooker" ¾ brother to a 26 lb. jr. 3 yr. old. They will be sold reasonably if taken at once. We also have several litters of very fine York pigs.

ROBERT C. HICKS,
West Bathurst, - - - N. B.

Chester White Pigs for Sale

Book your orders now for Chester White Pigs from four weeks upward. Pairs furnished that are not akin.

W. A. ERB, SUSSEX, N. B.

Advertise in the FARMER

Central Onslow, N. S., April 18, 1918.
Editor Maritime Farmer,
Dear Sir:—

We find the Maritime Farmer a good medium in which to advertise live stock. It always brings results. Some of our recent sales are as follows:—A bull to Black River Agri. Society, Black River, C. B. Three cows to Le Moine Bros., North Sydney, C. B. A fine two year old heifer to C. E. Hamilton, Lower Truro, N. S.—this is the third heifer that Mr. Hamilton has purchased from us this winter. The last one is a graddaughter of Miss La Handa, a cow that is quite well known to Maritime Province stock men.

Mr. A. D. Parker, Walton, Hants Co., N. S., got a fine pair of sisters, a yearling and a calf that will make him a fine foundation for a pure bred herd. Mr. Parker has been using pure bred bulls for some time, but decided to go a step further and get some females. We predict success for Mr. Parker with these heifers.

Mr. C. J. Coch, Central New Annan, N. S., purchased a very fine bull calf that should do a lot of good in his district. Mr. R. H. Putnam, Lower Onslow, got a nice young bull. This is the fourth bull Mr. Putnam has purchased here. We also sold a promising bull calf to Wilson Loggie, Loggieville, N. B. Mr. W. B. Jackson, Scotch Lake, N B., gets a fine heifer calf, (shipping its dam, which is a heifer), its eight nearest dams average 100 lbs. milk in one day and 29.98 lbs. butter in 7 days in official test.

Mr. Hugh Armstrong, Granville Ferry, N. S., gets a nice heifer calf. Mr. L. L. Archibald, Middle Musquodoboit, N. S., gets a bull calf and a yearling heifer sired by Colony Canary Ragapple, the bull owned by the N. S. Agricultural College. Mr. Archibald lives in a valley that has been lately opened up by railroad and has decided to go into dairying.

We have still quite a few bulls and heifers of different ages to sell. We will sell nothing that we would not be willing to keep ourselves for breeding stock. They are all in real good breeding condition, not one off in condition in our stable.

SAMUEL DICKIE & SON.

BREEDERS' DIRECTORY

Our charge for inserting names in this Directory is $2.00 per year for each line under each heading. Money must be paid strictly in advance. Names taken out promptly when time is up Stamps taken.

IN GROWING OF STRAWBERRIES ESSENTIALS TO BE OBSERVED IN PLANTING AND CULTIVATION

In selecting a site for a strawberry plantation, there are a few essentials that must be considered First, a rich, sandy loam seems to be best adapted for this crop, and if it has a quicksand subsoil so much the better. In case of drouth picking time a patch thus situated can pump up its market requirement, which is a decided advantage. A clay soil, provided it is not too stiff and is well drained, will produce fruit of fine quality, but the yields procured are not generally of the most profitable. Perhaps, however, sandy land having a gravelly subsoil is the poorest combination.

Usually land that will produce a good crop of roots is suitable for strawberries. Moreover, about the same method may be followed. There is this difference, though: In the case of the former avoid even a clover sod. Formerly, the writer supposed this land to be ideal and would think so still if it did not harbor so many white grubs. For this reason, it is preferable to follow a sod with corn and roots and plant the next year with strawberries . This also gives an opportunity to destroy the weeds to a large extent. It is generally advisable to use well-rotted manure as the ideal fertilizer for this crop. In the case of most farmers, nowadays, our present system of handling stable manure does not provide for much rotted manure being kept in the yard. It is spread on the land practically as fast as it is made. This, of course, means lots of weeds, so it is well to plan a preparatory hoe-crop, the cultivation of which will destroy the majority of these previous to setting out the plants. Wood ashes applied broadcast and harrowed in will prove very satisfactory. Beneficial results may be obtained from amounts ranging from twenty-five to one hundred bushels to the acre.

In setting out a new patch, always try to have the work done during May. For this purpose, it is best, when possible, to use home-grown plants. Being dug up and transplanted when fresh they are much more apt to live than those procured from a distance. It is important to use only those that have made their growth the year before. The ones that have fruited, have been weakened in vitality by the production of runners.

Regarding the varieties, it is best to be governed by what is known to be satisfactory in one's locality. As the earliest varieties usually bring the best prices, it is important to plant those which yield the greatest quantity of fruit as early as possible. It is also important to have varieties that will bear fairly large fruit. When they are to be shipped some distance a firm berry is also desirable. For instance Eastern Ontario is pretty sure of a severe winter and in view of this the Central Experimental Farm authorities recommended the following varieties as being especially hardy and hence more suitable for this district: Belder Wood. Lovett, Senator Dunlap, Pocomoke and Crescent.

The most satisfactory method for the average grower is that known as the matted row. It economizes labor, and while results may not always be equal to that obtained where special methods are adopted, there is less expense attached to it, and consequently, greater profit. In deciding upon the distance apart to set the plants, much will depend on the variety and the time. For instance, varieties making a large number of runners, such as Splendid and Senator Dunlop, may be planted further apart than those throwing out comparatively few runners, such as Williams. Then, too, if the planting is made in early spring thus allowing a long season for growth, a very narrow spacing will be unecessary. A good plan is to make rows with a marker, say four feet apart, and then cross-mark with rows two feet apart so that the plants may be set where the lines intersect. This admits of cultivation both ways, making it easier to keep down the weeds, and insure a better growth from a more thorough cultivation.

In planting, the holes may be made with a dible, a trowel or a spade. Personally, the writer prefers a spade. The hole is opened by forcing the spade into the ground and presing it forward and baskward. When it is withdrawn, the plant is placed in position with the roots spread fanlike against the side of the hole, and the soil pressed firmly against them with the foot. Care should be taken to have the crown of the plant just level with the surface of the ground when the job is done. If too high, the ground will dry out; if tool ow, it will be smothered.

As the future value of the crop will depend largely on the strength of the runners, and the new plants formed during the summer, it is important to encourage rapid growth at the outset. To accomplish this it is necessary to start the cultivator at the earlies possible moment and keep it going at frequent intervals until the work is interfered with by the growing runners. The earlier cultivations should be deep in order that the soil may be kept loose to encourage root development, and to warm and aerate it. Later this work should be more shallow so as not to injure the roots. As the season advances, it will be necessary to practice occasional hoeing in order to cut off stray weeds and keep the surface in proper condition.

If the best results are to be obtained it is essential to do a certain amount of hand work. All blossoms appearing during the first season should be pinched off so as to reserve the strength of the plant for throwing out runners. As a rule, if conditions have been right, most varieties make far more runners than should be allowed to remain. The strongest of these sould be placed where they will root most quickly and be uniformly distributed, and the ones not required, destroyed. As nearly as possible, the should be managed so that the runners wil not be nearer than from four to six inches apart.

The matter of winter protection is also important. While the strawberry is hardy and will stand almost any amount of cold weather, the alternate freezing and thawing of the ground in early spring is more or less fatal to it. Along in December after the ground has been frozen quite hard, the rows should be covered with a light coating of straw in order to prevent the heaving referred to. In the spring most of this covering should be removed, only enough being left to form a good mulch around the plants and keep the fruit clean.

What Will You Do For Help?

FARM help is scarce, but this condition can be relieved to a marked degree by using machines that accomplish more work in a given time with less man power.

Why should the farmer cling to horses—a slow, expensive means of power—when every other business is adopting the truck and thereby reducing the cost of hauling, speeding up deliveries, and saving for human needs the food that the horses would otherwise consume?

The motor driven truck can work constantly at maximum load under the burning summer sun, or in the coldest weather. Unlike the horse it needs no rests while working, it eats only while in actual use, and when the day's work is done it requires very little attention, and leaves you free for other "Chores" about the place. Then, it can be housed in one-quarter the space of the horses, wagon and harness it replaces.

It is a mistaken idea that a truck is useful only for driving upon paved roads. The Ford can be driven all over the farm, and used for hauling grain, potatoes, fruit, roots, fertilizer, wood, stock, milk or any other product. The speed it travels, the time it saves, and its low upkeep cost appeal very strongly to all users of the Ford Truck. If you need help, order your Ford One Ton Truck today.

MAN BEHIND DAIRY COW IS THE REAL DAIRY POWER THAT WILL COMPEL SUCCESS

Within recent years much scientific knowledge has been made available, with the object of making the dairy cow a more profitable investment. Special emphasis has been placed on the various phases of breeding and selection and feeds and feeding, involving the more or less complex operations of figuring balanced rations. Undoubtedly much good has accrued. Yet in the application of this scientific knowledge in a sufficiently practical way, to get results depends very largely on the man himself who is personally engaged in the business. This point of contact between knowledge and application is too frequently overlooked. When the cow on test makes a record that startles the dairy world, we invariably think of the man behind that particular cow. What are his special characteristics? What does he know? What does he do?

If a careful analysis is made of the circumstances, it will generally be found that his ability to do things from the standpoint of common sense is of more importance than merely knowing how. Better returns would often be secured if we always practiced the best we knew. But no dairyman of ambition will want to stand still. He will keep his eyes open to new possibilities in his line. Here he will need to exercise a degree of discrimination. To be an idealist and dream of future success is all right and quite commendable, but planning for the future must go hand in hand with good honest hustling. Some there are who look askance on every new idea that crops up. The fact that it is not in their regular routine causes them to be suspicious of its utility. This is going to the other extreme. The man behind the cow should possess open-mindedness as one of his chief characteristics. Remembering the injunction of Paul, let him "prove all things, hold fast to that which is good."

Of course, dairying as an occupation has its obstacles to overcome. The reater the success, the greater the difficulty of maintaining it. The man who is in and out at the first excuse never gets anywhere. To be a winner he must possess stability. In a rural district an association of farmers had surrounded the local cemetery with a new fence and a handsome gate. To complete the job they sought a motto to place over the entrance. Not being able to agree on anything definite, an appeal was made to Pat, the man who had dug the post holes. "Sure, and the best one I can think of," replied Pat, "is, 'We're in to stay.'" The man who adopts Pat's motto in the dairy business and lives up to it, has in him, at least, one important element of success.

The successful dairyman must be a constant student of "cowology." Considerable knowledge may be obtained by a careful observation of the animals under his care. He must be familiar with type and pedigree and know what degree of perfection is indicated. He must understand how to keep a cow in normal condition or provide a remedy when occasion demands it. A knowledge of sanitation is also essential if the herd is to be maintained constitutionally strong. While experience will teach much, the information thus obtained should be supplemented by the reading of good literature. This will include the bulletins and reports of experiment stations, articles in the agricultural press, etc. Life is too short to depend entirely on personal investigation. The wise man seeks a knowledge of his business from every possible source, then selects that which is best adapted to his own needs. These enquiries afield cannot but add to his capacity as a dairyman.

Some one is responsible for saying, "The man who breeds scrub cows is a scrub, he who breeds gardes is a grade but the man who breeds pure-breds of high rank is a thoroughbred." Of course, this statement needs modifying. Many a man who today stands high in the live stock world started with scrubs, for financial reasons, and gradually worked his way to the top. With such a man behind the cow a general advance is not long in taking place. He knows his cows not so much as Jerseys, Holsteins or Ayrshires, but first as individuals. He does not try to produce a May Echo out of an ordinary cow, because her name appears in the herd book. He weighs and tests the milk of each cow to ascertain her capacity. There is no guess work about it. Having this information at hand he is able to treat each animal according to her special requirements. Knowing what these are, each cow gets the feed and care that will enable her to do her best—not some other cow's best. Such qualifications have developed many a splendid herd throughout the country, and here and there, an animal with a magnificent record. To achieve this, the man behind the cow may be rightly termed a thoroughbred, and deserves to be ranked with the world's greatest.

If PAINT were paid for in WHEAT

DO not excuse a lazy neglect of painting this Spring by the mistaken view that present paint prices make painting an extravagance. That argument does not bear examination at all—because paint prices are not high, as compared with other necessities. The farmer's wheat, fixed in price at $2.25 a bushel, will buy more paint today than a bushel of wheat ever bought before. When paint was cheaper, wheat was cheaper; and so with other farm produce and dairy produce too. It all brings more today than in pre-war days. For proper protection of his home exterior—to prevent decay and weather-damage—the farmer cannot afford to neglect his Spring painting; nor can he afford to use cheap paint. It's economy in the long run to use a paint so good as

B-H "ENGLISH" PAINT

70% Pure White Lead
(Brandram's Genuine B.B.)
30% Pure White Zinc
100% Pure Paint

This is the paint we guarantee to possess as its important basis the above correct formula.

This formula, printed on every can, and guaranteed over our President's signature, commits us to this standard. High in cost as white lead has become, we *must* use it in the same proportion as heretofore. To use less of it, would necessitate the removal of the guarantee from our cans—and to do that would injure the reputation that these paints have acquired by reason of their superior ingredients. It is by using pure white lead and pure zinc in such liberal quantities that we have been able to produce a paint that truly excels in covering capacity—and that stands the severe climate test of Canada in a way that spells true economy for all who use it.

Other B-H Products of Sterling Worth

For Interior Varnishing
The name "China-Lac" suggests a china-like finish—and that is just the kind of finish you get from the use of China-Lac—the perfect varnish stain. Being transparent, it preserves the "grain-beauty" of the natural wood—at the same time giving splendid color effects. Easy to apply—not affected by either hot or cold water.

For Staining the Roof
Our "Anchor" Brand Shingle Stains are especially prepared to preserve wood from decay. Easy to apply—on rough surfaces they give a better effect than paint. Shingles may be dipped or brushed on. Come in 19 different colors.

For Plaster Ceilings and Walls
Use Fresconette—a flat tone oil paint. Fresconette comes in a variety of shades. It is absolutely sanitary, for it may be cleaned with a damp cloth or thoroughly washed at will.

For Varnishing a Floor
Our "FLOORLUSTRE" finishes a floor with a lustrous coating of the most durable enamel. Will stand hardest wear—will not show scratches. Excellent for interior floors. For Porch Floors, Ceilings, Posts, etc., where surface is exposed to the weather, use B-H Porch Floor Paints.

Imperial Barn Paint affords a convenient protection for barn and outbuildings, made of good material, covers well, dries hard, goes furthest and lasts longest.

Reroof the leaky barn with Brantford Asphalt

A leaky roof always gets worse and is apt some day to cause a lot of damage to the crops in the barn or the furnishings and wall paper in the house.

With Brantford Asphalt Roofing selling at such reasonable prices, it is true economy to roof with it. There is hardly another line of goods that has had the small advance in cost since the war that Brantford Roofing has had. By installing improved machinery and increasing the volume of our output, we have lowered our cost of production which has enabled us to keep down the price of Brantford Roofing below what might be expected in the face of the rising cost of raw material, labor and transportation.

Old wooden shingles are being replaced with Brantford Asphalt Roofing. It can be laid very rapidly, saving time, which means considerable when labor is scarce and high. It is a wonderfully fire-resistant roofing—a fire starting on a Brantford Asphalt Roof being unknown to this day. It is also very durable being completely waterproof and the asphalt blended and tempered to resist all the extremes of the Canadian climate.

Brantford Asphalt Roofing

is finished on both sides with a surface of silicia sand and is made in three thicknesses and weights.

No. 1 is 60 lbs. per square. No. 2 is 70 lbs. No. 3 is 80 lbs.

Brantford Rubber Roofing

has the same high quality asphalt saturation and coating as Brantford Asphalt Roofing but it has a smooth, rubbery surface instead of being sanded. It is also in three weights. No. 1 is 40 lbs. No. 2 is 50 lbs. No. 3 is 60 lbs.

Standard Mohawk Roofing

While this roofing is lighter in weight than Brantford Asphalt and Brantford Rubber it is the best quality of any low price roofing on the market. It is a standard that has been tested for years and given entire satisfaction. Sanded on one side. One weight only—40 lbs.

Mohawk Rubber Roofing

The same grade as Standard Mohawk exept that it has a smooth surface. Used for all classes of temporary works—sheds, barns, shacks, bunk houses, camp sites; and even dugouts in the trenches are covered with it. 35 lb., 45 lb., and 55 lb. weights.

Leatheroid Roofing

Slightly lower quality than Mohawk Rubber and used for same purposes. Has a leathery surface. Exceptionally good roofing at a low price. 35 lb., 45 lb., and 55 lb. weights.

Samples and prices mailed on request.

Volume 23. SUSSEX, NEW BRUNSWICK, JUNE 11, 1918. Number 17.

Clover and Clover Seed Production

The agricultural survey of Dundas county in 1916, showed that a very small percentage of the farmers were growing their own clover seed. Practically all visited were sowing red clover, but on many of the farms the amount of seed sown per acre was very small, being in some instances less than three pounds. About two-thirds of the grain sown was found to be seeded with clover.

Red clover is one of the principal foundation stones of permanent agriculture in Dundas county. It has for centuries constituted an important factor in maintaining a permanent system of agriculture in the Old World. In this country, it has assumed in recent years a more and more important role in the maintenance of soil fertility. It is utilized both as hay and as a pasture crop, and sometimes as a soiling crop.

Clover as Feed.—Clover cut at the right time and properly cured can hardly be surpassed as a dry fodder for dairy cows and beef cattle. A moderate amount mixed with timothy is also good for horses. Sheep and young stock are fond of clover and will thrive better upon it than upon timothy. It contains more digestible protein and is also a better fat producing fodder than timothy.

Clover as a Fertilizer.—Clover stores in the tubercles on its roots nitrogen from the air and it also forms humus in the soil when ploughed under as a green manure. Consequently, it adds plant food to the soil and improves its texture. From 1894 to 1902, comprehensive experiments were conducted at the Central Experimental Farm, Ottawa, to determine the effort of clover upon soils. Various kinds of farm crops were grown on plots, a portion of which had grown clover in the previous year and a portion of which had not been seeded to clover the previous year. A large number of plots were usd in this experiment, many kinds of crops were grown and as the experiment extended over several years, the results are reliable and valuable. There was a noticeable increase in yield on the plots where clover had been grown. The increase in Banner oats amounted in some instances to as much as 19 bushels an acre. The increase in barley was as high as 15 bushels an acre. In corn fodder, the increase on the plots receiving clover was as high as four tons in the case of Longfellow, while with Leaming, there was an increase, in some instances, of over 11 tons per acre. Potatoes showed an increase as high as 50 bushels to the acre on the clover plots.

The method of conducting these experiments was, briefly, as follows: Ten or twelve pounds of clover seed were sown in the spring with a nurse crop. Late in the fall the resulting clover crop was ploughed down if grain was to follow the next year, or ploughed down the second or third week in May of the following spring if corn and potatoes were to be planted. Thus, it was from only one year's growth of the clover, that these results were obtained. Other experiments have been conducted which have shown that a crop of clover stubble ploughed under increased crop yields.

Good Seed Necessary.—In sowing clover, good seed should be used. Good seed, though costing more, has been found by repeated trial to be the cheapest in the end.

Methods of Seeding.—While clover has been hailed as a great soil improver, it must not be thought that it can always be grown successfully on poor and worn-out soils, or that it will give satisfactory results when carelessly sown. In Dundas county, clover is usually seeded with the spring grain. On sandy soils it should be sown a little deeper than on the heavier soils in order that it may come in contact with the moist earth, which will aid germination. From one and one half to two inches is not too deep in sandy soil. A better seeding will usually be obtained when sown with a nurse crop that will be harvested early than if sown with later maturing crops. When clover seed is being sown, it is best to sow the nurse crop slightly thinner than usual. A light top dressing of manure on the knolls and on spots where the soil is poor will often prove beneficial and will help the young plants to make a stronger growth to carry them through the winter.

There are various opinions regarding the effect of clover seeding on the nurse grain crop. This matter has received attention from the Central Experimental Farm at Ottawa and it has been found that the seeding of clover has no noticeable effect upon the yield of the grain crop with which it is sown. Further south, it has been found that, when the nurse crop is cut, the hot dry weather often kills out the young crop of clover. This may occasionally happen in Eastern Ontario, but the weather is usually cool enough and there is generally sufficient moisture in the soil to enable the young plants to survive and become vigorous before going into the winter.

Clover Sown with Summer Pasture.—Land where annual summer pastures are sown, such as oats and peas, or oats and vetches is usually a good place to seed with clover. It has been found that, on account of the nurse crop being pastured off early, the clover seeding is given an opportunity to develop. While the tramping of the ground may be thought to injure the clover plants, it has been found to be beneficial rather than harmful.

Seeding with Fall Grain.—While very little fall grain is grown in Dundas county, the method of seeding fall crops may be here mentioned. Timothy is sown in the fall with the fall grain and the clover seeded in the spring. The clover seed should be sown upon the last light fall of snow late in the spring or on a morning when the ground is slightly frozen.

Thickness of Seeding.—Many farmers fail to get a good stand of clover because they do not sow enough seed. Where a field is to be kept for hay and pasture, timothy should always be sown with the clover. If the clover does not come throuh the winter successfully, or, for some other reason, does not give a good crop, the farmer will have the timothy to fall back upon. A good mixture, is eight pounds of red clover, two pounds of alsike, and eight pounds of timothy. This may seem a fairly heavy seeding, but from many tests conducted at our experimental stations, the thick seeding of clover and timothy has given uniformly better results than the thin seeding. On the heavier soil of Dundas county, if the season is favourable, a lighter seeding of clover will give good crops, but it is safer to sow a sufficient amount to allow for the seeds that will not germinate and for the plants that will be killed out. The thicker stand of clover also forms a winter protection and helps the plants to survive the cold weather. A thick crop of clover also helps to control and smother out weeds. If a thin crop of clover there will always be open spaces where weeds are sure to grow. An excellent test for each farmer in Dundas county to conduct would be to sow, on a field where soil conditions are uniform, a round or two of the drill with a lighter seeding than he usually sows, and a round or two of the drill with a heavier seeding than he usually sows. The two plots should be sown side by side and each seeding carefully marked in order to compare the results, both as to ability to come through the winter and as to yield.

Care of Clover Going into the Winter.—Many farmers make a practice of pasturing the young seeding in the fall after the grain has been cut. They thing it is a waste to allow the young crop to go unpastured. Experience has shown that very often young clover crops closely pastured down have been killed out during the winter, because the vitality and strength of the plants were gone and in their weakened condition they could not survive the trying winter and spring weather.

If clover is being tried on a field where the soil is poor, it is a good plan to give it a light top dressing of manure after the grain crop has been cut. This will strengthen the young plants and will help them to come through the winter in better condtiion.

Seed Production.—A very small percentage of the farmers in Dundas county are producing their own clover seed. This is not because it cannot be successfully produced in Dundas, but because very little attention has been given to this matter in the past. Some splendid crops of seed were harvested and threshed by Dundas County farmers during the past season. There are many advantages to be gained by growing and sowing home-grown seed. The farmer who has seed of his own this year (1918) will not likely sow it so sparingly aa he would if he had to buy it at the present high price. Best results are obtained from the home-grown seed. On a number of illustration farms conducted in other parts of Ontario by the Commission of Conservation in previous years, home-grown seed, and seed purchased from seed merchants, were sown side by side in the same field, under uniform conditions. In every instance, the home-grown seed came throuhg the winter better. In some cases, the crop from home-grown seed came through the winter safely, while that from purchased seed was badly injured. By sowing home-grown seed, there is no risk of introducing noxious weeds from other parts of the country as often happens when the seed is purchased.

The second crop of clover is often pastured when it would pay much better to allow it to ripen for seed. It does not matter if some timothy or other grasses be present, as the clover aftermath is but little affected by other grasses in the second crop, which usually make a light second growth. It often happens too, that a second crop of clover looks thin and may be thought too poor to produce a crop of seed. Let it be remembered, however, that a thin crop will not produce much pasture. In one case in Quebec, known to the writer, a 24-acre field of second crop, which was being kept for seed, looked to be too thin to be worth harvesting and though it gave only one-half ton to the acre of the clover before being threshed, it yielded 141 pounds of seed per acre. Had this field been pastured much of the clover would have been tramped down into the ground and the amount of feed really obtained by the stock would have been small.

Cut First Crop Early.—A mistake commonly made by many farmers is the cutting of the hay crop too late. Very often this will prevent the harvesting of clover seed. The seed on red clover comes from the second cutting; consequently, the first crop should be cut early to allow the second crop to produce seed before danger of frost in the fall. To get best results in Dundas county, the first crop should be cut before July 1st. Many farmers postpone the cutting of the first crop, thinking that the longer they leave it the more tons of hay they will obtain. This is true up to a certain point, but, after thore point is reached in the maturity of the crop, the percentage of crude fibre becomes greater, lowering the percentage of digestible protein. Early cut hay, providing it is well cured, will be more nutritious and more readily eaten than hay which is allowed to become too ripe. Cut the first crop early if the second crop is to be saved for seed.

Keep Weeds Cut.—Home-grown seed is good, but absolutely clean home-grown seed is better. There will likely be more weeds in the first crop than in the second. The weeds in the second crop should be kept cut or pulled. This is usually an easy matter to handle. The weeds at this time of year

(Continued on page 551)

No Special Curtailment

Washington, D. C.—There will be no specified curtailments of the motor car industry. Car manufacturers have agreed with Government officials that war needs demand 100 per cent, priority on steel and other materials required for munitions manufacture. The committee completed negotiations with the War Industries Board with the understanding that the Government will take steel and whatever other materials it needs up to 100 per cent. and the motor car manufacturers will arrange their programs accordingly. They will use their proportion of that steel that is left over pro rata with other non-war manufacturers.

Each company has been advised by the committee to consider its production and program problems in view of this arrangement. The committee was informed by the War Industries Board that there had been no official attempt to set the curtailment to 75 per cent. as had benn indicated by newspaper despatches. The committee denied all responsibility for this statement.

Car Makers' Argument

The conference included arguments on the part of the motor car committee to the effect that labor would be hrown out of work, huge organaizations disrupted, making them inefficient for war work, and that financial disaster of a $2,000,000,000 industry would result tfrom a drastic curtailment. When the War Industries Board officials recommended a severe reduction in passenger car manufacture it was pointed out that they had been in error previously, that the shortage situation might clear up in the next 90 day sand that the Government did not actually know its own requirements for steel and other materials, and that a severe curtailment might mean the destruction of huge industries unnecessarily.

When the Government officials persisted the motor car committee stood pat. It stated that it would not set a curtailment figure but would force the responsibility for any such drastic curtailment upon the War Industries Board. In view of its own lack of knowledge of steel and other material requirements, the Board hesitated to set a specified drastic curtailment which might be unnecessary and in the near future bring severe criticism upon the War Industries Board, with the result stated above—that there will be no specified curtailment, but instead an arrangement whereby the Government has first and full priority with motor car makers taking what materials are left for use in production of cars.

It was agreed that this plan was by far the best. It prevents all hysteria and panic in the industry and especially among the 37,000 dealers. It gives the Government all of the materials it needs, yet it allows the industry to run up to normal production, as speedily as the shortage situation clears up. Acording to the agreement made between the industry and the War Industries Board the present 30 per cent. curtailment period expires July 31.

The steel situation is the pressisg one, and whatever curtailment for next year is decided upon will be dictated very largely by the supply of steel. The Shiping Board, under Edwin N. Hurley, has announced that it is building 4,000,000 tons of shipping but Chas. M. Schwab, who has assumed charge of production, declares that he is going to build 6,000,000 tons of shipping. This will mean a heavy drain on the steel resources of the country. The proposal not to ship steel to any industries for a period of 60 days seems to have been primarily intended to stock up the ship yards with steel so that next winter there will not be any holding back of the ship-building program because of a failure of our transportation system, similar to that of last year. The War Industries Board is determined that those primary war industries, such as ship-building, etc., will be cared for no matter how other industries have to suffer.

The N. A. C. has given out the following statement, indicating that it is working in harmony with the War Industries Board on the question of curtailment:

> Representatives of the National Automobile Chamber of Commerce, W. C. Durant, John N. Willys, John F. Dodge, Walter E. Flanders, C. C. Hanch and Hugh Chalmers, have just completed a 3-day session reviewing with the War IndustriesBoard, the War Department, the Railroad Administration and other government departments the situation in regard to the supply of raw materials and transportation.
>
> After a thorough investigation the committee was convinced that the government demands should be given unquestioned priority, volunteered all possible assistance and pledged the entire resources of the industry to speeding up the war program; keeping in mind at the same time its accomplishment, with as little disturbance to general business as possible.
>
> Until the government needs are more definitely known, the industry, in addition to the manufacture of airplanes, tanks, tractors, shells, mineanchors, helmets and other munitions will apply itself to helping to solve the great problem of transportation which is directly in its line.

The Sugar Situation

Some surprise has been expressed by the general public at the new sugar regulations put in force the 1st day of May by the Canada Food Board. People wondered why the sudden scarcity of sugar, having understood since the first of the year that the new Cuban crop was sufficient to supply the wants of this Country and the United States, whatever might have been the situation in Europe, where Java sugar was cut off owing to war conditions.

The situation in this Country, however, has been materially changed since the first of the year. At that time the International Sugar Commission of New York, which handles the raw sugar of this Continent, allocating and distributing the amounts in Canada and the United States, as well as other Countries, considered that there was sufficient sugar in Cuba to allow Canada 320,000 tons as against 400,000 imported last year. As Canada last year exported 55,000 tons of refined sugar, her consumption was then 345,000 tons and this year at 320,000 tons her supply would be reduced merely by 25,000 tons or 6%, which would not have been a severe hardship upon anybody or made much disturbance in the trade. In addition to this outlook the Commission expected to have a surplus of 700,000 tons to work on later, of which Canada's share would be 70,000 tons or 10%, so that before the year was out this Country would have been supplied, under former arrangements, with 45,000 tons more sugar this year than last. Consequently there was no necessity for the Food Board placing any restrictions upon the consumption of sugar in this Country, in view of the fact that Trans-Atlantic shipping was so taken up with other more vital cargoes that space could not be spared for sugar. Wheat, meat, munitions and men for the Army are more imperatively needed in Europe than even sugar, and there are not ships enough to carry everything.

It was expected, however, that there would be shipping enough in the coastwise trade of the United States to bring raw sugar from Cuba and the West Indies to New York and other American points. Owing, however, to the congestion at the wharves of the Atlantic Coast, the break down in railway transportation and the general and totally unexpected demand upon the American transportation system generally, it has become a difficult matter to move the freight necessary for this Country and the difficulty has not been overcome as yet. It was hoped that some arrangement, for bringing sugar direct from Cuba to Canadian Ports, could have been effected but this attempt has had to be dropped. Shipping is not available, consequently the new sugar regulations.

Keen Interest in Co-operative Wool Marketing by N. B. Wool Growers

J. D. Thompson, Dominion Government Wool Grading Expert Says Fine Grade of Wool Accumulated at Fredericton Station

J. D. Thompson, expert wool grader from the Live Stock Branch, Ottawa, has arrived at Fredericton to grade the gool at the Fredericton warehouse. Next week he proceeds to Moncton to grade the wool at the Moncton warehouse. These wool warehouses are operated in connection with the Canadian Co-operative Wool Growers, Ltd. an Association organized to promote the sheep interests of Canada.

The Provincial Department of Agriculture has carried on a vigorous campaign in co-operation with the Livt Stock Branch and the Association to further interest the wool growers in this method of marketing whereby the middlemen and local buyers are eliminated. The wool passing direct from the grower to the purchaser.

By marketing through the Association, farmers can confidently expect to get the highest possible price obtainable.

Speaking of prices Mr. Thompson states that he has recently visited the Boston market and was given to understand that prices would range even higher than he had expected. Furthermore Mr. Thompson reports that the wool at the Fredericton warehouse will grade very high and that it is in the best condition of any wool that he has graded this year. This augurs well for the price that the New Brunswick wool growers will receive and also speaks well for the local wool growers, considering this is the initial effort, along this line, on an extensive scale in this province.

The main idea to keep in mind in marketing wool co-operatively is that the Association forces local buyers to pay somewhere near what the wool is worth, and farmers should keep this in mind. Again, the Association wool is graded and properly prepared. The Association caters to the Woolen Mills and gives them exactly what they want. They get a guaranteed product and consequently are willing to pay the highest market value.

The ware houses at Fredericton and Moncton will continue to take in wool during the entire month of June. Those farmers that have not any standard sacks or twine can ship in clean bran sacks and in lieu of paper twine can use the neck band to tie each fleece with separately.

United Farmers Organizing

At an executive meeting of the United Farmers of N. B. held in Woodstock on May 31st, arrangements were made to carry on an extensive organizing programme throughout the Province. Committees to arrange for organizing new branches were chosen as follows: Joh nYoung anad A. E. Chapman for York County; Thos. Caldwell John Fulton and Rennie Tracey for the upper end of Carleton County; Sterling Peopody, Frank Everett and C. Gordon Sharpe for the lower end of Carleton, Victoria County; Chas. Duman and Frank Henderson for south end; Judson Corey, Albert Dionne and Jerry Hafford for Tobique River; Frank Gillispie and Miss G. Portias for Grand Falls section. The Secretary read communication from L. Saunders, President of the Farmers' and Dairymen's Association, J. Titus Burns and others, all oflering their services to help with organaizing programme. There are requests coming from all parts of the Province for the services of an organaizer. A letter from R. McKenzie, Secretary of the Canadian Council of Agriculture, was read in which the Council offers to send a man to assist in organizing in the Province. It was received with enthusiasm.

At a meeting of the Directors of the United Farmers Co-operative Co. of New Brunswick, Ltd., C. L. Smith was made President of the Company, Rennie Tracy Vice-President, and C. Gordon Sharpe Sec.-Treas. Committees were appointed to arrange for the purchase of feed and fertilizer and to make arrangements for starting a Co-Operative store in Woodstock in the near future.

There was a strong feeling that the producer and consumer should be brought closer together at the earliest possible moment.

What a Cow Can Do

There never was a time when it was so unprofitable to keep unprofitable cows as the present year. With the high prices for feed and labor it is more difficult than ever to show a balance on the right side of the ledger in the dairy business. While the prices demanded for dairy products have advanced very materially, they have not kept pace with the pricest he dairyman has to pay for the various commodities essential to his business. It does not pay to keep boarder cows. If the farmer has given the individual cows in his herd an honest chance to make good, and strict records of their performance have beent kept, he is not on to his job if he continues to keep the delinquents.

For example, farmer A purchases two cows at $100 each. One of these consumes $135.00 worth of feed, but her calf and milk yield a return of $175.00. The other cow consumes an

equal amount of food but her calf and milk yield returns of only $75.00. The first cow makes a profit of $50 while the second cow is kept at a loss of $50. In other words the unprofitable cow eats up all the profit made by the profitable cow. The farmer would have been able to bank $50.00 if he had only kept cow number one. By keeping cow number two, the robber cow, he is forced to just break even, so far as cash returns are concerned. The care of cow number two took up a lot of his time and labor and he was minus the interest his money would have brought if left in the bank or otherwise invested judiciously.

Auchenbrain Brown Kate 4th, an Ayrshire cow, in a year gave 23,022 pounds of milk, testing 3.99 per cent fat. She was well fed. In the year she consumed 704 pounds of bran, 762 pounds of hominy, 1,074 pounds of ground oats, 548 pounds of gluten feed, 134 pounds of peanut meal, 908 pounds of oil meal, 8,000 pounds of silage, 21,000 pounds of beets and 2,880 pounds of alfalfa hay, the total costing $184.62. Her milk was sold at 5 cents per quart, and the income above the cost of feed was $541. She received as much feed as some men would give to a dairy herd. She had the ability to use it well. Four such cows on a little farm would make their owner a nice income and would require much less expenditure in time and labor than a herd of cows yielding individually a narrow margin of profit, of sufficient numbers to give a similar return.

Increasing Bees

The importance of increasing bees in preparation for a greater honey crop next year makes it oportune to draw attention to a simple method of increase that has been employed at the Central Experimental Farm, Ottawa. Some of the methods of increase used by beginners are wasteful, causing young brood to be deserted and consequently chilled and starved, or leaving the bees of the new colonies too long idle before their queen begins to lay. These troubles, however, may be prevented by making increase from colonies that have thrown a prime swarm, and at the same time a fair crop of honey may be obtained from the swarm.

The method consists in simply dividing the parent colony into a number of nuclei about six days after the swarm has left the hive. Each nucleis will consist of a comb or two containing honey, brood (much of which will be capped) and one or two queen-cells containing queens soon to emerge, with the adhering bees, placed in a separate hive towards evening. Held by their capped brood and queen-cells, the bees will not return next day to the parent hive to any extent, and it is possible under favorable conditions to make as many as eight or nine nuclei from a colony on ten combs, bu tthe inexperienced should not attempt more thana four or five.

Under ordinary conditions, the queen in each nucleis will emerge within a few hours and will commence laying within ten days. When she begins to lay, a comb of brood from another colony given to the nucleus will help to build it up quickly. A colony can us ually spare brood during the honey flow without reducing the honey crop gathered, because brood does not produce beee ready for field work for two or five weeks, by which time the honey flow has usually ceased.

If no swarmed colonies are available, the next best method of making increase is to place most of the brood of a strong colony into the super, leaving the queen below with the rest of the brood, a queen excluder separating the two chambers, and a week later to form two or three nuclei with the combs in the super and adhering beees, giving to each a queen-cell con taining a queen soon to emerge. Very often it will be found that the bees have made queen-cells on these combs. But it is better to raise them from selected stock.

However, the beginner is liable to meet with difficulties and losses in raising queens and forming nuclei from regular colonies. These difficulties increase when the honey flow declines or ceases. It then becomes hard to raise many or good queens, and the robbing of newly formed nuclei has to be carefully guarded against. June is often a better month than July for making increase, and August is too late in many places.

It is necessary to warn the inexperienced beekeeper against dividing up a colony into too many unclei. Nuclei should be strong enough by September 15 to fill the space between eight or nine combs in order to pass the winter safely. A pair filling only five spaces were, however, wintered successfully at Ottawa in a 10-frame hive with a wire-cloth partition between them. The following spring during dandelion bloom each was placed in a separate hive and became a strong colnoy in time for the clover honey flow.

Crow vs Corn

(Experimental Farms Note).

In Canada, the most serious enemy to the corn crop is the crow. A dose of shot is an infallible cure for the latter's fondness for corn, but, unfortunately it is more easily prescribed than administered. There are, however, other means of combatting the trouble.

(1). TREATING THE SEED. Immerse the corn for 2 or 3 minutes in water as hot as can be borne by the hand. Drain, and while the corn is still moist and warm, add half a cupful of coal tar or pint tar per gallon of seed. Stir until every kernel is coated with tar. As a drier, add a small quantity of lime, plaster, or even dry road dust. If the work is well done, seed so prepared may be sown by machine, but the feed should be watched carefully for fear clogging may occur.

(2) DEEP PLANTING. Plant the corn not less than 3 inches deep. This will prevent it from being washed to the surface by heavy rains and, after germination, the young shoot will break off when the crow attempts to pull up the plant.

(3). POISONED CORN. When crows are noticed on the field, take some corn, say two gallons, more or less according to the size of the field, and boil for about thirty minutes in just sufficient water to cover corn to the depth of one inch. To the water and corn, before boiling, add about one-eighth ounce of strychnine or, better still, of strychnine sulphate, for each gallon of water. Allow the corn to lie in the strychnine and water over night. In the morning drain off any water remaining and scatter the corn thinly over the corn field.

In making use of the above plan great care should be taken to pour the water off the corn into some hole or in a spot not likely to be frequented by children or domestic animals. Care should also be taken to keep poultry off the corn field for two or three weeks after the poisoned corn has been scattered thereon.

(4). A device much used in some localities is "stringing the field." Stakes 3 or 4 feet high are placed here and there and connected by twine to which may be attached pieces of paper or bits of bright tin. Dead crows obtained by method 3 may also be attached to the twine or stakes. The time-honoured "scarecrow" may also be tried, but is must be admitted that the crow of today does not seem very deeply impressed by this old device.
